Welcome to Las Vegas

Welcome
Bienvenidos

On behalf of the Staff and the IBFR, I welcome you to Las Vegas, Nevada and the 2011 Winter Global Conference on Business and Finance. We hope you have a productive conference and enjoy your time in Las Vegas. If we can be of any assistance to you during your time in Las Vegas please do not hesitate to contact us.

We all know that college professors must balance their teaching, research, and service obligations. Finding the right forum to share and obtain feedback on our research, new teaching techniques, and innovative administrative processes can be challenging at times. The Institute for Business and Finance Research was created to facilitate your work by providing an environment conducive to knowledge and experience sharing. We encourage the academic community to come and share their work at our conferences and Journals. We welcome articles which are of interest to scholars and practitioners in all fields of business, economics and related fields.

The 2011 Las Vegas GCBF represents a long term commitment to bring individuals from around the world together to share their ideas and promote research on business and finance. The response to the conference has been outstanding. We wish to thank you for selecting the GCBF as your research outlet. We also wish to thank the many people that have contributed to making the conference a success. We are delighted to report that the conference is truly a global conference. We have participants from all corners of the globe at this academic conference. These individuals come from a variety of high quality institutions and will present work on a broad mix of academic issues.

We are proud to announce two upcoming conferences. Our eleventh conference will be held in San Jose, Costa Rica, May 24-27, 2011 at the Ramada Plaza Herradura Hotel & Convention Center. Our Twelve conference will be held in Honolulu, Hawaii, January 3-6, 2012 at the Ala Moana Hotel & Conference Center. We hope that you are able to join us at these events.

We hope you take the time to enjoy the hotel facilities as well as to take in Las Vegas and the surrounding countryside. Las Vegas is a wonderful destination with much to offer. We recognize that in addition to presenting research and participating in the conference activities, it is also important to relax and rejuvenate yourself. Have some fun! You deserve it! We hope that you will go home refreshed and with a sense of accomplishment.

Warmest Regards,

Mercedes Jalbert
Conference Chair

Carta del Editor

Bienvenidos a Las Vegas

Welcome
Bienvenidos

El Instituto y su personal les da la bienvenidos a Las Vegas, Nevada y al 2011 Global Conference on Business and Finance. Esperamos que su participación sea productiva y que disfruten Las Vegas.

Todo profesor de educación superior debe encontrar un balance entre su rol como educador, investigador y como servidor a su comunidad y su universidad. Encontrar un foro donde podamos compartir y obtener retroalimentación sobre nuestra investigación, nuevas técnicas de educación, procesos administrativos innovadores es retador. El Institute for Business and Finance Research (IBFR) fue creado para facilitar el trabajo del profesional en educación superior, profesional del sector públicos y profesional del sector privado al crear una plataforma global conducente al enriquecimiento de nuestro conocimiento a través de:

1. La exposición de trabajos investigativos en todas las áreas académicas de las ciencias administrativas, ciencias económicas, financieras, etc.;
2. La exploración de nuevos avances tecnológicos, teóricos, pedagógicos;
3. El intercambio de conocimiento en una plataforma verdaderamente global.

Los Congresos GCBF representa un compromiso a larga plazo para unir a nuestros colegas de todos los continentes en nuestros congresos y compartir nuestras ideas, investigación y cultura en una plataforma bilingüe. Deseamos agradecer su participar, la cual hace realidad nuestro objetivos; el realizar un Congreso realmente Global con participación de educadores y profesionales de todos partes del mundo.

Con gran alegría anunciamos nuestros próximos Congresos en San Jose Costa Rica del 24 al 27 de mayo de 2011 en el Ramada Plaza Herradura. Nuestro congreso de invierno se realizara Honolulu, Hawaii del 3 al 6 de enero, en el Ala Moana Hotel & Convention Center. Será un placer el contar con su participación nuevamente.

Deseamos que disfruten su estancia en el Hotel y que tengan la oportunidad de explorar Las Vegas. Sabemos que además de exponer sus trabajos, es también importante tomar tiempo para relajarse, rejuvenecerse y conocer sobre otras culturas, tradiciones, etc. Esperamos que al regresar a sus hogares e instituciones se sientan rejuvenecidos y satisfechos con sus alcances y aprendizaje durante el Congreso.

Estamos para asistirles durante el congreso y el futuro.

Saludos Cordiales,

Mercedes Jalbert

Conference Chair

TABLE OF CONTENTS

ENGLISH PROCEEDINGS	1
BOARD AND FIRM PERFORMANCE: EVIDENCE FROM TAIWAN	2
CHANG-JUI LIN, FU JEN CATHOLIC UNIVERSITY & NATIONAL OPEN UNIVERSITY	
FOREIGN EXCHANGE EXPOSURE	11
PETER HARRIS, NEW YORK INSTITUTE OF TECHNOLOGY

BOARD AND FIRM PERFORMANCE: EVIDENCE FROM TAIWAN

Chang-Jui Lin, Fu Jen Catholic University & National Open University

ABSTRACT

This study uses the three-year data of major listed electronic companies in Taiwan to analyze the effect of duality and board organization on firm's performance, which involves three variables, i.e., market-based Tobins'Q and accounting-based ROA and ROE. The results indicated that independent variable has a positive effect on firm's performance in terms of Tobins'Q while other variables have no effects. When using ROA and ROE as outcome variables, the results indicated that duality has a negative influence on firm's performance; supervisory directors, outside independent directors and inside directors, which are variables of board structure, have a positive effect on firm's performance; board size has a negative effect on firm's performance. However, family controlled directors seem to have a negative influence on firm's performance only in terms of ROE but not ROA.

KEYWORDS: board structure, duality, board organization, firm's performance

INTRODUCTION

Corporate governance concerns the effect of board structure on firm's performance. Since shareholders elect board members, major shareholders have more advantages when electing directors and supervisory directors because they take over the majority of share rights, which means, they can choose and appoint their own persons as directors and supervisory directors. Therefore, major shareholders holding majority of share rights can control the company by controlling the majority of directors and supervisory directors; therefore, influencing the operation of the company. The effectiveness of corporate governance will influence the business performance of the company. In recent years, Taiwan government has begun to pay much attention to corporate governance. On October 2002, Taiwan Stock Exchange Corporation announced *Corporate Governance Best-Practice Principles for TSEC/GTSM Listed Companies*, which stipulates that listed companies must establish effective corporate governance structures, formulate their own corporate governance codes to enhance the function of board of directors, ensure shareholders' equity and thus strengthen corporate governance effectiveness of listed companies.

In Taiwan, a large number of studies have explored the issue of corporate governance, focusing mainly on (1) corporate governance and performance (Chiang & Lin, 2007; Luan & Tang, 2007; Huang, 2010), (2) corporate governance, leadership relation and remuneration (Lin, 2005), (3) establishment of corporate governance indicators (Chen *et al.* 2007), and (4) corporate governance and financial crisis (Lee & Yeh, 2004). The implementation of corporate governance in practice deserves exploration. This article investigates the influence of leadership structure and board organization on firm's performance. Taiwan's electronic industry plays an important role in the supply chain of global electronic industry. This study takes three-year data of listed companies in Taiwan electronic industry as research samples to explore the corporate governance of Taiwan electronic companies for the purpose of understanding the influence of board structure on firm's performance in corporate governance in terms of practice.

LITERATURE REVIEW

Three major theories explain corporate governance: (1) agency theory, (2) stewardship theory, and (3) resource dependence theory. (1) Agency theory has two major facets, i.e., the effect of the board organization on firm's performance and the effect of board leadership structure (i.e., duality) on firm's performance (Nicholson & Kiel, 2007). Board of directors supervises primarily corporate operation. Additional outside directors can supervise corporate managers to prevent them from pursuing their own interests. (2) Stewardship theory considers managers as reliable, high-level executives who will not

exhibit behaviors that would be unfavorable for shareholders, therefore inside directors can achieve better firm's performance and create more profit for shareholders. (3) Resource dependence theory suggests that board members have connections to important external resources and can maximize the firm's performance (Nicholson & Kiel, 2007).

Board of directors is the most important component of corporate governance; therefore, we need to understand the board structure. Finegold *et al.* (2007) pointed out that board structure is duality, consisting of inside and outside directors, board size, board share ownership and directors' remuneration. The condition of board structure will influence firm performance. Therefore, most studies on corporate governance and firm's performance studied the influence of board of directors on firm's performance. Bonn (2004), Bonn *et al.* (2004), and Jackling and Johl (2009) have analyzed firm's performance and board structure; Abidin *et al.* (2009) have analyzed values of board of directors and firm's performance; Luan and Tang (2007) have analyzed outside directors and firm's performance;. All of the above studies used board structure or a certain property of it to target different firm performance variables assessed with Tobin's Q, ROA, or ROE to understand the effects of board structure on firm's performance. Many proxy variables are being used to evaluate firm's performance; however, Tobin's Q, ROA, and ROE are most frequently used proxy variables (Kiel & Nicholson, 2003; Luan and Tang, 2007; Huang, 2010; Lam and Lee, 2008).

The two major subjects of agency theory are concerned with (1) the effect of duality and (2) the effect of board organization on firm's performance (Nicholson & Kiel, 2007). (1) Duality concerns leadership structure in terms of duality or the service by separate persons; duality will reduce the supervising effectiveness of board of directors (Yammeesri & Herath, 2010). (2) Concerning board organization, because Taiwan has the two-tier board system, board of directors is composed of directors and supervisory directors. Supervisory directors' major responsibility is to audit, control, and prevent fraudulent behaviors of directors while directors' major duty is to supervise CEOs' management of the firm (Huang, 2010). Finegold *et al.* (2007) have analyzed 105 periodicals and found that in terms of board structure, duality has a vague influence on firm's performance. No consistent results have been reported in terms of proportion between inside and outside directors. Regarding board size, some studies showed positive correlation while others showed negative correlation. The studies indicate the need to clarify many areas of influence of board and share structure on firm's performance. Therefore, the influence of board structure on firm's performance is still a subject that deserves attention. This article will discuss the influence of each aspect of board structure on firm's performance separately.

HYPOTHESES

Duality: The effect of duality is indistinct, with some studies showing positive result while others showing negative results (Finegold *et al.*, 2007). Jermias (2007) found that duality has a negative effect on firm's performance. According to agency theory, when chair of the board also serves as CEO, the effectiveness of board of directors' supervision of CEOs will be reduced and the chair of the board might have more control over fulfilling private interests (Finkelstein & D'Aveni, 1994). Therefore, duality is not good for firm's operation, suggesting that it will have a negative influence. Therefore, this study proposed the following hypothesis:

H1a: Duality relates negatively to firm's performance.

However, Kota and Tomar (2010) pointed out that duality significantly influences firm's performance. According to stewardship theory, inside directors will create higher profit for shareholders to achieve better performance (Nicholson & Kiel, 2007). Chiang and Lin (2007) mentioned that better performance could be achieved when the chair of the board also serves as CEO due to effective and explicit leadership with unity of command. The above findings indicated that duality is good for firm's operation and positively influences firm's performance; therefore, the following hypothesis is proposed:

H1b: Duality relates positively to firm's performance.

Board size: The number of board members will influence the efficiency of board operation. Jensen (1993) pointed out that when the number of board members exceeds seven or eight, it weakens the function of the board and allows CEO to easily control the board. When the number of board members is small, the board's communication improves and board members are more likely to reach consensus. Chiang and Lin (2007) considered that in Taiwan, smaller board of directors could reduce the problem of bureaucracy and thus enable a better functioning. Based on these studies, smaller board of directors will have better communication and will reach consensus faster. Therefore, this study proposed the following hypothesis:
H2: Board size relates negatively to firm's performance.

Supervisory directors: Board of directors in Taiwan is composed of directors and supervisory directors. In such a two-tier board system, primary duties of supervisory directors is to supervise how directors conduct their work while supervising the performance of firm and reviewing firm's business and financial status. Therefore, the major function of supervisory directors in Taiwan is to audit, control, and prevent directors' disloyal behaviors (Huang, 2010). Dahya *et al.* (2003) pointed out that the effectiveness of supervision of the majority of supervisory directors is unsatisfactory. Huang (2010) reported that the number of supervisory directors correlates negatively with firm's performance, suggesting that firm's performance decreases with increasing number of supervisory directors. Following hypothesis is proposed:

H3: The number of supervisory directors relates negatively to firm's performance.

Families controlled directors: Among listed companies in Taiwan, major shareholders of the families that control companies nominate some directors (Yeh *et al.*, 2001) while affiliated companies of the controlling family nominate others. The more control the families exert over the directors, the easier it becomes for these families to request that CEOs pursue the maximum interests of the controlling family. The more the families control the directors, the more negative the influence on firm's performance. Filatotchev *et al.* (2005) pointed out that families controlled directors correlate negatively with firm's performance. Following hypothesis is proposed:

H4: The percentage of family controlled directors that serves on the board of directors relates negatively to firm's performance.

Outside independent directors: Agency theory points out that outside directors can supervise high-level executives and control whether they seek their own interests, consequently reducing the agency's cost (Fama, 1980). Bonn (2004) pointed out that outside independent directors in Australian companies are effective indicators of Australian boards of companies, correlating positively with the company's ROE. Huang (2010) pointed out that outside directors in Taiwanese banks correlate positively with banks' financial performance. Luan and Tang (2007) reported that outside independent directors of listed electronic companies in Taiwan correlate positively with firm's performance. From the above discussion, the number of outside independent directors seems to be positively related to firm's performance. Therefore, this study proposes the following hypothesis:

H5: The number of outside independent directors relates positively to firm's performance.

Inside directors (directors serving as managers) : Finegold *et al.* (2007) reviewed 105 articles and pointed out that the ratio between inside and outside directors affects firm's performance. There are no consistent findings to conclude that increasing outside directors would increase firm's performance. Wagner *et al.* (1998) reviewed 29 articles in a meta-analysis and discovered that increasing the number of both inside and outside directors has a positive influence on firm's performance. Stewardship theory thinks that inside directors can achieve better firm's performance and create more profit for shareholders (Nicholson & Kiel, 2007). Therefore, the following hypothesis is proposed:

H6: The number of inside directors relates positively to firm's performance.

RESEARCH VARIABLES

Board variables

Duality: Duality means that one individual takes the positions of both the chair of the board and CEO. Duality will be coded as a dummy variable in this study. When the chair of the board also serves as a CEO, the variable will be coded as 1, otherwise it will be 0.

Board size (B-size): Board size reflects the total number of directors and supervisory directors serving on the board of directors.

Supervisory directors (Sup-director): Number of supervisory directors serving on the board of directors.

Families controlled directors (FC-director): directors or supervisory directors nominated and appointed by the major shareholder of families controlling the company (Yeh *et al.* 2001), or by relatives/friends of controlling families. All of the above are families controlled directors who will make decisions on company's operation according to controlling families' interests.

Outside independent directors (Outs-director): These include directors or supervisory directors not served by internal personnel, members of families controlling the company, or relatives/friends of families controlling the company, but by external persons who have no relationship with the company.

Inside directors (Ins-director): When a director serves concurrently as deputy vice general manager, assistant general manager, or manager, he is an inside director. Inside directors take positions of high-level executives concurrently and participate in the companies' daily business operation (Yammeesri & Herath, 2010; Johnson *et al.*, 1996).

Performance variables

This study adopts three performance variables that most researchers use to evaluate firm's performance, including market-based Tobins'Q and accounting-based ROA and ROE (Lam & Lee, 2008; Huang, 2010).

Tobins'Q: Tobins'Q is a definition proposed by Brainard and Tobin (1968), i.e., the ratio between market value and replacement cost of corporate assets. This study adopts the proximate calculation formula of Tobins'Q proposed by Chung and Pruitt (1994). The formula is as follows:

$$\text{Approximate } q = (\text{MVE} + \text{PS} + \text{DEBT}) / \text{TA} \quad (1)$$

“where MVE is the product of a firm's share price and the number of common stock shares outstanding, PS is the liquidating value of the firm's outstanding preferred stock, DEBT is the value of the firm's short-term liabilities net of its short-term assets, plus the book value of the firm's long-term debt, and TA is the book value of the total assets of the firm.” (Chung and Pruitt, 1994)

$$\text{Tobins'Q} = (\text{market value of common stock} + \text{market value of preferred stock} + \text{short-term liabilities} - \text{short-term assets} + \text{long-term debt}) / \text{total assets.} \quad (2)$$

ROA: return on assets. *net income/average total asset.*

ROE: return on equity. *net income/average net worth.*

Control variable

Firm size (F-size): Majamdar (1997) pointed out that firm size is positively correlated with firm's performance. This article takes natural logarithm of total net annual sales as control variable.

ANALYSES AND FINDINGS

Data

Since Taiwan electronic industry is playing a vital role in supply chain of the global electronic industries, this study takes Taiwan electronic industry as the research sample. We obtained three-year's (2007-2009) data for listed companies from Taiwan Economic Journal (TEJ) Data Bank and selected large firms with annual sales in the first half as research samples. Complete data were available for 662 Electronic listed companies in 2007, 686 companies in 2008, and 719 companies in 2009, totaling 2067 electronic companies for the three consecutive years. The number of companies with annual sales in the first 50% was 331 in 2007, 343 in 2008, and 359 in 2009, which totals to 1033. Table 1 summarizes the descriptive statistical data for independent variables, dependent variables, and control variables.

Findings

Tobins'Q, ROA, and ROE were used as dependent variables in the regression equation analysis to verify the six research hypotheses. Table 2 summarizes the results of the regression analysis. The VIF values of independent variables in three regression models range from 1.148 and 1.474; therefore, there is no collinear problem. The first regression model used Tobins'Q as dependent variable, adjusted $R^2 = 0.011$. The control variable firm size correlated negatively, with no significant influence on the outcome variable. Only outside directors correlated positively with and had significant influence firm's performance in terms of Tobins'Q, supporting hypothesis H5. Other board structure variables had no significant influence. Duality, supervisory directors, and families controlled directors all negatively correlated with firm's performance in terms of Tobins'Q but without significant effects. Board size and inside directors correlated positively firm's performance in terms of Tobins'Q without significant effects. Therefore, hypotheses H1a, H1b, H2, H3, H4, and H6 were not supported.

Table 1: Descriptive statistics

	Minimum	Maximum	Median	Mean	S.D.
Duality	0	1	0	0.2972	0.4572
B-size	6	19	9	9.4569	1.9028
Sup-director	0	5	3	2.6196	0.7872
FC-director	0.0909	1	0.5	0.5161	0.1866
Outs-director	0	6	2	1.6292	1.4228
Ins-director	0	7	2	1.9148	1.3113
Sales (NTD million)	1669	1473026	5760	27418	102031
F-size	7.4197	14.2028	8.6587	8.9810	1.2053
Tobins'Q	-0.2884	12.0537	0.7168	0.9915	1.0303
ROA	-0.6239	0.5310	0.0675	0.0647	0.1033
ROE	-1.7976	0.7405	0.1083	0.0867	0.1888

Note: $n=1033$; Duality: is a dummy variable that is set to 1 when there is CEO duality and 0 otherwise. B-size: the number of board members. Sup-director: the number of supervisory directors on the board of directors. FC-director: The number of directors controlled by the controlling families and relatives/friends of controlling families. Outs-director: the number of outside independent directors on the board of directors. Ins-director: the number of inside directors on the board of directors. Sales(NTD million) the annual sales of the company. F-size: the natural logarithm value of the annual sales of the company. Tobins'Q: (market value of common stock+ market value of preferred stock+ short-term liabilities- short-term assets+ long-term debt)/ total assets. ROA: net income/ average total asset. ROE: net income/average net worth.

The second regression model used ROA as dependent variable, adjusted $R^2 = 0.062$. The control variable firm size correlated negatively with firm's performance in terms of ROA, with no significant influence. Duality correlated negatively with and had significant influence on ROA of firm's performance,

supporting hypothesis H1a but not H1b. Board size correlated negatively with and had significant influence on ROA of firm's performance, supporting hypothesis H2. Supervisory directors correlated positively with and had significant influence ROA of firm's performance, rejecting hypothesis H3. Families controlled directors variable correlated negatively with ROA of firm's performance and had no significant influence on outcome, rejecting hypothesis H4. Outside directors variable correlated positively with ROA of firm's performance and had significant influence, supporting hypothesis H5. Inside directors variable correlated positively with and had significant influence on ROA of firm's performance, supporting hypothesis H6.

Table 2: regression model analysis

	Model(1)		Model(2)		Model(3)	
	Tobins'Q		ROA		ROE

Note: Duality: is a dummy variable that is set to 1 when there is CEO duality and 0 otherwise. B-size: the number of board members. Sup-director: the number of supervisory directors on the board of directors. FC-director: The number of directors controlled by the controlling families and relatives/friends of controlling families. Outs-director: the number of outside independent directors on the board of directors. Ins-director: the number of inside directors on the board of directors. F-size: the natural logarithm value of the annual sales of the company. Tobins'Q: (market value of common stock+ market value of preferred stock+ short-term liabilities- short-term assets+ long-term debt)/ total assets. ROA: net income/ average total asset. ROE: net income/average net worth. ***, **, and * indicate significance at the 1, 5 and 10 percent levels respectively.

The third regression model used ROE as dependent variable, adjusted $R^2 = 0.061$. . The control variable firm size correlated positively with and had significant influence on firm's performance. In addition, duality correlated negatively with and had significant influence on ROE of firm's performance, supporting hypothesis H1a but not H1b. Board size correlated negatively with and had significant influence on ROE of firm's performance, supporting hypothesis H2. Supervisory directors variable correlated positively with and had significant influence ROE of firm's performance, rejecting hypothesis H3. Families controlled directors correlated negatively with and had significant influence on ROE of firm's performance, supporting hypothesis H4. Outside directors variable correlated positively with and had significant effect on ROE of firm's performance, supporting hypothesis H5. Inside directors correlated positively with and had significant influence on ROE of firm's performance, supporting hypothesis H6.

DISCUSSIONS AND CONCLUSIONS

This study focused on the effects of board structure on firm performance in corporate governance. Board structure consists of variables such as duality, board size, supervisory directors, families controlled

directors, outside independent directors, and inside directors. Regarding board leadership structure, the outcome this study indicated that duality has a negative influence on both ROA and ROE of firm's performance, i.e., when the chair of the board also serves as CEO, firm's performance will worsen. Such conclusion is that same as the finding of Yammeesri and Herath (2010). It indicates that board of directors can effectively supervise CEO to make decisions to benefit the company and thus promote firm's performance only when the chair of the board does not serve as CEO.

Such a conclusion is an opinion complying with agency theory. Board size had a negative influence on ROA and ROE of firm's performance. Such conclusion of this study is the same as the findings of Bonn *et al.* (2004) (Japanese companies) and Chiang and Lin (2007) (Taiwan companies). It becomes difficult to coordinate too many members on the board of directors, to endorse directors' expertise, and to establish interpersonal relationship (Forbes & Milliken, 1999). Jensen (1993) pointed out that board's function would be weakened and easy to be controlled by CEOs when the number of board members exceeds seven or eight. When the number of board members is not many, board members can communicate and reach consensus more easily. Therefore, when the number of board of directors is eight or less, the effectiveness of board of directors will improve; thus, the firm's performance will also improve. This study found that the number of supervisory directors has a positive influence on ROA and ROE of firm's performance, indicating that greater number of supervisory directors is linked to stronger supervision of board of directors, which improves firm's performance. Dahya *et al.* (2003) pointed out that if a supervisory director is just an honored guest, a friendly advisor, or a censored watchdog, his report will be of no use at all. Therefore, companies should employ more supervisory directors to promote firm's performance.

This study also found that families controlled directors have a negative influence on ROE of firm's performance, replicating the finding of Filatotchev *et al.* (2005). Most of the big shareholder families control board of directors; however, their interests will not be the same to that of all shareholders. It is evident that, when considering ROE, major shareholders will consider their own interests when participating in the company's operation decisions, in spite of the interests of all shareholders. Thus, family controlled directors have a negative effect on ROE of firm's performance. Therefore, companies should reduce families controlled directors to promote firm's performance. Outside independent directors have a positive influence on Tobins'Q, ROA, and ROE of firm's performance. This result is consistent with the findings of Luan and Tang (2007) and Bonn (2004) who found that outside directors have positive influence on ROE as well as the finding of Huang (2010) who found that outside directors have positive effect on ROA and ROE. Moreover, this result supports the finding of Bonn *et al.*

(2004) who reported that outside directors have positive influence on ROA. Inside directors have positive influence on ROA and ROE of firm's performance, which is consistent with the finding of Yammeesri and Herath (2010) who found that inside directors have positive influence on Tobins'Q. Wagner *et al.* (1998) evaluated 30 articles and discovered that both outside independent directors and inside directors have positive effect on firm performance. This study supports this conclusion. This study analyzed only companies in Taiwan's electronic industry, no other manufacturing industries. Only large companies whose performance rankings are among the first 50% were analyzed, corporate governance of companies with less performance were not considered. The above conditions are the limitations of this study.

FOREIGN EXCHANGE EXPOSURE

Peter Harris, New York Institute of Technology

Scott Liu, New York Institute of Technology

Bhushan Adeshara, New York Institute of Technology

John Malindreotos, New York Institute of Technology

Foreign exchange exposure is a measure of the ability for a firm's profitability, net cash flow, and the market value to change as a result of a change in exchange rates. An important duty of the financial manager is to measure the effect of foreign exchange exposure and manage it in such a way as to maximize the profitability, net cash flow and market value of the firm. When foreign exchange rates change, the effects on a firm can be measured in several days. Three main types of foreign exchange exposure are translation, transaction, and economic exposure. Translation exposure measures potential accounting changes in a firm's consolidated financial statements that result from a change in foreign exchange rates. Transaction exposure measures the change in the value of the firm's outstanding obligations, which are incurred prior to the change in foreign exchange rates but not expected to be settled until after the exchange rates change. Economic exposure measures the change in expected cash flows as a result of unexpected changes in foreign exchange rates. This paper will illustrate some background information on the three major forms of foreign exchange exposure. The available resources to handle each of these exposure will be examined in detail.

EPS FROM THE PERSPECTIVE OF COMPREHENSIVE INCOME: EMPIRICAL EVIDENCE FOR SPANISH COMPANIES IN TIMES OF CRISES (2004–2008)

Francisco Sousa Fernández, University of Cantabria (Spain)

María Mercedes Carro Arana, University of Cantabria (Spain)

ABSTRACT

Focusing on the scenario of the internationalisation of comprehensive income, in this paper we intend to empirically evaluate its impact on Earnings per Share (EPS) as opposed to the same ratio determined according to the more traditional net income, for the Spanish companies listed on the IBEX-35, during the period 2004-2008, incorporating the effects of the serious financial crisis. The results show statistical differences between the EPS calculated using both types of income, with a spectacular deterioration in 2008, the year of the severe financial crisis. This would suggest an important reference for decision makers, especially analysts and investors.

JEL: M41

KEYWORDS: Earnings per Share (Comprehensive income & Net income), international accounting, Spanish companies listed on the IBEX-35 (2004-2008), useful reference for investors and analysts.

INTRODUCTION

The Financial Accounting Standards Board (FASB) was a pioneer in incorporating comprehensive income into its Conceptual Framework (Statement of Financial Accounting Concepts (SFAC 3, 1980; replaced by SFAC 6, 1985, par. 70), in which it is understood as all changes in equity of a business enterprise in any given financial year, excluding owners transactions.

This concept of business performance (Feltham and Ohlson 1995, Brief y Peasnell 1996, Linsmeier et al. 1997, Mattessich 2002, Newberry 2003, Cauwenberge y Beelde 2007 and Sousa 2009a, among others), has been incorporated into the standards of the main accounting standards setters [Statement of Financial Accounting Standard (SFAS 130) of the FASB and International Accounting Standard (IAS 1) of the International Accounting Standards Board (IASB), among others].

Now, at the beginning of the 21st century, with the 2007 review of the IAS 1, which entered into force on 1st of January 2009, comprehensive income is becoming a stronger indicator of business performance.

We must also consider that in IAS 33 (2003) of the IASB, in addition to regulating the assessment and disclosure of traditional Basic Earnings per Share and Diluted Earnings per Share, contained in paragraph 73, the door is also left open for companies to disclose in their financial statements the impact of other figures from their Statement of Comprehensive Income, incorporated by IAS 1 (2007), regarding the weighted average of ordinary shares outstanding.

Of the figures that appear in said financial statement it is worth mentioning the bottom line, which is the comprehensive income as described above, and which is determined by the regulatory body of the IASB adding to net income items of expense and income which according to the corresponding standards should be recognised directly in equity. Said items include, among others, changes in fair value of financial instruments classified as available for sale, cash flow hedges, differences in foreign currency exchange and changes in fair value of tangible and intangible fixed assets, if the companies should opt for

this evaluation criterion. Therefore we have a business performance which much better represents the reality of the market than traditional net income.

Within this framework of international financial information, our research aims to evaluate empirically the impact of comprehensive income on Earnings per Share (EPS) as opposed to the same ratio determined according to the more traditional net income for a select group of companies listed on the Madrid Stock Exchange of the IBEX-35 for the period between 2004 and 2008, thus incorporating the years of economic boom with the serious economic crisis of 2008.

In addition to the analysis of the corresponding descriptive statistics and the results obtained using box plots, we adopted, as a tool of comparison, the non-parametric Wilcoxon Signed-Rank Test, as the variables in certain years were far from normalcy. Our study, apart from shedding light on an area that has been investigated very little, is of particular interest since in paragraph B102 of the Basis for Conclusions for IAS 1 (2007) it is stated that the IASB, in the discussion period to which said standard refers, received suggestions regarding what may be included in the main body of financial statements along with other alternative measures that differ from that found in traditional Earnings per Share.

This has to do with traditional Earnings per Share calculated according to traditional net income which is not considered the most relevant indicator for financial analysts, to which regard we therefore propose in our research other alternatives for calculating same, such as determining said ratio in accordance with comprehensive income (Cauwenberge y Beelde 2007 and Sousa and Carro 2009b), something which the IASB has not ruled out and may reconsider within the framework of the current Financial Statements Presentation, and in turn integrate it into the Memorandum of Understanding (MoU), which is being developed in conjunction with the FASB.

We can anticipate that Earnings per Share calculated in accordance with comprehensive income impacts in a statistically significant way compared to the more traditional net income for the companies listed on the IBEX-35 in three of the five years studied, in particular in the year 2008, in which comprehensive income, due to the effects of the serious economic crisis, shows a spectacular deterioration of said ratio. This empirical evidence, as well as suggesting a new tool for fundamental analysis, is of particular interest to investors and analysts, not only justifying the inclusion in the Notes of Earnings per Share according to comprehensive income, but also justifying a prominent and relative disclosure in the main body of the Statement of Comprehensive Income regulated by IAS 1 reviewed in 2007.

The paper is organized as follows. Section 2 provides the conceptual foundations of comprehensive income. Objective, Sample and Methodology are described in Section 3. Section 4 provides analysis and interpretations of the empirical findings and Section 5 concludes the paper.

LITERATURE REVIEW

In order to provide theoretical backing to our research we must define the essential foundations on which comprehensive income is based. The FASB was the pioneering standard-setter to incorporate the concept of comprehensive income in the SFAC 3 (1980), replaced by SFAC 6 (1985), where this concept is defined in paragraph 70 as “the change in equity of a business enterprise during a period from transactions and other events and circumstances from non-owner sources. It includes all changes in equity during a period except those resulting from investments by owners and distributions to owners”.

This concept is close to the concept of income set forth by the British Nobel Prize award winner Hicks (1939: 172): “A man’s (*sic*) income is the maximum value which he can consume during a period and still expect to be as well off at the end of the period as he was at the beginning”.

According to Alexander (1950: 15), if we transfer this economic concept to Accounting, the profit of a business corporation can be defined as the amount of dividends that a company can distribute to shareholders without diminishing the capital invested, that is, remaining at the same level of wellbeing at the end of the year as it was at the beginning.

This definition leads us to clean surplus theory (Brief and Peasnell 1996, Feltham and Ohlson 1995 and Mattessich 2002, among others), pursuant to which corporate performance captures relevant events from the point of view of value, and is determined comparing the book value of equity at the end of a financial year with that registered at the beginning of said period, without the shareholder's operations.

In short, as referred by Linsmeier *et al.* (1997) and Sousa (2009a), in adopting comprehensive income we see an important event in Accounting at the beginning of the 21st century as is the approach to the economic concept of income advocated by authors of the Classical Normative-Deductive School (MacNeal 1939, Alexander 1950, Edwards and Bell 1961 and Spouse and Moonitz 1962, among others).

However, comprehensive income is not conceived now as a sole and unquestionable *a priori* magnitude as these authors considered, but rather devised to satisfy the needs of the users, particularly of investors, given that it contributes to the efficient functioning of the market and to usefulness of the accounting information for market valuation of corporations (Mora 2004: 10).

METHODOLOGY

Upon reviewing the empirical literature on comprehensive income from the international perspective of recent years, we can observe that as well as a series of descriptive studies (Bhamornsiri and Wiggins 2001, and Pandit *et al.* 2006, among others); there is a body of research orientated towards capital markets (Dhaliwal *et al.* 1999 and Hodder *et al.* 2006, among others); other studies have analysed comprehensive income compared with net income from different angles (Sousa and Carro 2009a and 2010-2011); while other investigations have focused on studying the impact on analysts and investors of the way in which comprehensive income is presented (Hirst and Hopkins 1998 and Hunton *et al.* 2006).

However, apart from the pioneering work of Sousa and Carro (2009c), there are no studies that have taken into account the impact of comprehensive income with regard to Earnings per Share, in particular, in the context of a serious economic crisis such as that which is happening currently.

Therefore, as highlighted in the above introduction, we undertake, as an essential objective of our research, to study whether Earnings per Share calculated according to comprehensive income impacts significantly on the same ratio determined pursuant to the more traditional net income for companies listed on the IBEX-35 during the period 2004-2008, paying special attention to 2008 because of the serious economic crisis.

As previously indicated, our research is of particular interest since in the Basis for Conclusions of IAS 1 (2007) reference is made to the fact that the IASB in the period of discussion of said standard, received suggestions regarding what may be included in the main body of financial statements along with other alternative measures regarding earnings per share, given that the traditional Earnings per Share calculated pursuant to net income is not considered the most relevant indicator for financial analysts, according to Cauwenberge and Beelde (2007), we also propose other alternatives by which to calculate same, such as based on comprehensive income. Moreover, we would also extend and supplement our research to the impact of comprehensive income on other relevant ratios for fundamental analysis such as the Price to Earnings Ratio, exceeding the proposed boundaries and objective of the study may lead to subsequent interest and further study.

Furthermore, although we are aware of the analytical limitations that arise from any ratio which draws on information of annual accounts presented by companies, due to the accounting policies followed by these companies, the idea of considering comprehensive income as a much broader indicator of business performance than traditional net income, incorporates a new analytical perspective with regard to the performance of economic entities.

Sample

Moreover, in order to conduct our research we take as a point of reference the information disclosed in the Annual Consolidated Statements of the Spanish companies listed on the IBEX-35 in accordance with the International Financial Reporting Standards (IFRS) of the IASB, for the years 2005, 2006, 2007 and 2008, also including the data from 2004 as comparative information in the Annual Consolidated Statements of 2005; available at the website of the National Commission for the Spanish Stock Exchange (CNMV in Spanish) and the websites of the listed companies.

By considering the period between 2004 and 2008, a boom period as well as a year of large scale recession and the collapse of international stock exchanges, as in 2008, we are able to assess the extent to which comprehensive income impacts on Earnings per Share in extremely diverse economic and financial circumstances. We want to stress that we have found that the majority of corporate groups did not disclose comprehensive income in accordance with the principles of IAS 1 (2003), in particular those who opted to apply the Statement of Changes in Net Equity, with which we constructed the comprehensive income variable based on the items that comprise it, which were contained in said statement or in the Notes.

We also wanted to limit our study to the companies listed on the IBEX-35 (*Iberia Index*), a capitalisation weighted index, employed by “Bolsas y Mercados Españoles” (BME), which is the principle index of reference for the Spanish stock market, and comprises the 35 companies with the most liquidity in the market. Among other listed companies, the index comprises, Telefónica, Banco Santander Central Hispano, Banco Bilbao Vizcaya Argentaria, Repsol and Endesa; large Spanish corporations with a global presence, particularly in Latin-America. On the other hand, the two Banks are included in The Banker’s Top 25 World Banks 2010.

As from 1st of January 2005 all listed companies of the European Union are obliged to disclose their consolidated financial statements in accordance with the IFRS of the IASB, to which the current convergence of financial information models must be added in line with the IASB standards, not only on a European scale but on a world scale. The fact that we use a sample of 35 listed Spanish companies with the most liquidity and apply said regulatory body, means that our work addresses current issues and is of international interest, it also suggests further lines of investigation with respect to companies listed on other stock markets on a global level.

METHODOLOGY

Before justifying the tools that we use to carry out the empirical research it is necessary to explain the variable of Earnings per Share according to net income in each year t , on which we base the research, bearing in mind the regulatory stipulations of IAS 33 (2003), said variable naturally coincides with that disclosed in the Annual Consolidated Statements of the sample of listed companies when the criteria of said standard are applied.

$$\begin{array}{l} \text{Earnings} \\ \text{per Share (t)} \\ \text{(Net income)} \\ \text{[EPS-NI]} \end{array} = \frac{\text{Net income attributable to the ordinary shareholders of the parent company (t)}}{\text{Weighted average number of ordinary shares outstanding (t)}}$$

We also need to define the new variable of Earnings per Share, incorporated into our research, calculated according to comprehensive income.

$$\begin{array}{l} \text{Earnings} \\ \text{per Share (t)} \\ \text{(Comprehensive income)} \\ \text{[EPS-CI]} \end{array} = \frac{\text{Comprehensive income attributable to the ordinary shareholders of the parent company (t)}}{\text{Weighted average number of ordinary shares outstanding (t)}}$$

Net income and comprehensive income, in both mathematical expressions, have been determined with the incorporation of continuing operations, discontinued operations which appears to a very small extent among business groups has not been included.

We must bear in mind that the numerator and denominator in both expressions respectively, have been adjusted by the business groups in order to comply with the corresponding stipulations established in IAS 33. Moreover we have not considered Diluted Earnings per Share since the vast majority of the business groups only disclosed Basic Earnings per Share. Once the variables have been defined, in order to evaluate the differences between them, the parametric tool of the Student's T-test would be suitable.

However as we note in Table 1, in accordance with the Kolmogorov-Smirnov sample test, the normal null hypothesis is rejected for the variables defined by the difference between the two ratios in four out of the five years studied. Not adapting the data to a Gaussian distribution for the majority of years studied, in order to obtain the contrast we adopt the alternative non-parametric tool, the Wilcoxon-Signed Rank Tests, with a confidence level of 95 %, for which the significance is $p < 0.05$.

We also want to consider that said test contrasts the null hypothesis of which the medians of the two related variables are the same, applying this to our investigation allows us to establish whether the Earnings per Share determined according to comprehensive income differs significantly to that calculated according to net income, both being determined in accordance with the IFRS of the IASB in the period between 2004-2008 for the select group of companies listed on the IBEX-35.

RESEARCH RESULTS

Before beginning our analysis, we want to analyse the descriptive statistics of the variables that are to be analysed, as set out in

Figure 1: EPS-CI and EPS-NI

This figure shows the EPS-CI and EPS-NI average for the period 2004-2008 for companies listed on the IBEX-35. Earnings per Share Value (EPS-CI and EPS-NI) expressed in Euros. Source: Compiled by author, from the Database and SPSS v. 17.0.

Table 2: Descriptive Statistics

Variable	N	Average	Standard Deviation	Minimum	First Quartile	Median	Third Quartile	Maximum
EPS-NI-2004	35	1.82	4.09	-0.05	0.64	1.00	1.33	24.79
EPS-CI-2004	35	1.70	3.26	-0.07	0.57	1.01	1.51	19.64
EPS-NI-2005	35	2.83	7.36	0.07	0.73	1.18	2.44	44.10
EPS-CI-2005	35	2.75	5.42	-0.05	0.79	1.28	2.56	31.97
EPS-NI-2006	35	2.53	4.16	0.06	0.82	1.29	2.09	22.06
EPS-CI-2006	35	2.47	4.30	0.06	0.69	1.33	1.70	22.26

This table shows the descriptive statistics of the EPS-CI and EPS-NI average for the period 2004-2008 for companies listed on the IBEX-35. Earnings per Share Value (EPS-CI and EPS-NI) expressed in Euros. Source: Compiled by author, from the Database and SPSS v. 17.0.

We can observe that for the sample as a whole, in all years studied, Earnings per Share determined according to comprehensive income is less than that calculated according to net income. Thus no great differences were found for the years 2004, 2005, 2006 and 2007. However, in the year 2008, the Earnings per Share calculated according to comprehensive income fell spectacularly compared to the same ratio calculated according to net income.

The explanation for this substantial difference in 2008 is simply the strong negative impact on the results of certain new items of the business groups incorporated in comprehensive income, such as the changes in fair value of the financial instruments classified as available for sale, cash flow hedges adjustments, due

to the gravity of the current financial crisis; including negative differences in foreign currency conversion due to fluctuations in the exchange rate of the Euro and the Dollar.

Moreover in Table 3, we wanted to study how Earnings per Share calculated according to comprehensive income tangibly impacts on businesses compared to when calculated according to net income. For this which we rely on the analysis of extreme and outlier values obtained from the box plot diagrams, taking the differential of both ratios as variable. Extreme values are those greater than 3 times the length of the box from the top or bottom edge of the box, bearing in mind that the length of the box is the inter-quartile range; and the outlier values correspond to values between 1, 5 and 3 lengths of the box from the top or bottom edge of the box, the length of the box here also represents the inter-quartile range.

We observe that a considerable number of listed companies, almost half of the sample, show extreme or outlier values in one or several of the years studied, in some cases showing a spectacular difference, which shows us the marked effect on listed companies of different sectors with respect to Earnings per Share calculated according to comprehensive income compared to that calculated according to net income.

Moving on to the comparative analysis carried out using the Wilcoxon-Signed Rank Test, in Table 4 we can observe notable differences between the average ranks and the sum of the ranks of the ratios that are object of this study, particularly with regard to the year 2008 which suffered a severe economic crisis.

Table 3: Extreme values and outliers

Listed Companies	Sector	Period 2004-2008					Average 2004-2008

*This table shows extreme values (*) and outliers (o) for the companies listed on the IBEX-35 regarding the differential between the EPS-CI and the EPS-NI in the period 2004-2008. Expressed in Euros. Source: Compiled by author, from the Database and SPSS v. 17.0.*

These notable differences between the positive and negative ranges upon comparing both ratios, as set out in Table 5, lead to statistically significant differences for the years 2005, 2007 and 2008, being $p < 0.05$.

Based on the empirical evidence uncovered we can say that with regard to the listed companies as a whole, of the IBEX-35, for the years 2005, 2007 and 2008, the Earnings per Share calculated according to comprehensive income impacts in a statistically significant way on that calculated according to net income, both being disclosed in accordance with the IFRS of the IASB. These results are largely in line with the results produced from the work by Sousa and Carro (2009c), in which statistically significant differences were found between both ratios for the years 2004-2007.

Moreover, our study considered the select group of companies listed on the IBEX-35 instead of a sample of all Spanish companies listed on the Stock Exchange of Madrid as was the case in the study by the above-mentioned authors, thus providing additional empirical evidence regarding the crisis effect with the inclusion of the year 2008.

Therefore, taking into account the empirical evidence uncovered by our research, together with that produced by the above-mentioned study, we are able to confirm that within the analytical framework of Earnings per Share there is an impact or effect on comprehensive income compared to net income, owing to the fact that the first better represents the reality of the markets.

This is because as previously stated, comprehensive income, compared to the more traditional net income, essentially incorporates into income changes in fair value of financial instruments classified as available for sale, cash flow hedges adjustments and differences in the conversion of foreign currencies.

We also wanted to consider that if an all inclusive measure of income is adopted, as in the case of comprehensive income, then the reality of the market have an impact in a ratio for fundamental analysis, such as a Earnings per Share ratio which has been the object of our investigation, especially, as we have shown, in the context of a severe economic crisis such as the current one.

However if a much more restrictive measure of company performance is adopted, as in the case of traditional net income, then we are less aware of the impact of the market on income. This way an all inclusive concept of income represents information which is much more relevant to the user, in particular for investors considered in the Conceptual Framework as users of reference.

CONCLUSIONS

We have studied the impact of Earnings per Share calculated according to comprehensive income compared to that determined by the more traditional net income for the period 2004-2008, of the companies listed on the IBEX-35 in accordance with the regulatory stipulations of IAS 1 (1993, reviewed in 2003 and 2007) and IAS 33 (2003) of the IASB.

Based on the evidence obtained by our study we can say that there is a statistically significant impact on Earnings per Share calculated according to comprehensive income compared to that calculated according to net income with respect to the sample as a whole for the years 2005, 2007 and 2008.

Moreover, there was spectacular deterioration in the year 2008 with respect to said ratio considering comprehensive income compared to the more traditional net income, due to the marked negative effects of the present crisis, that incorporates comprehensive income through items such as changes in fair value of financial instruments classified as available for sale, cash flow hedges adjustments or differences in the conversion of foreign currencies.

The empirical findings of our research, although limited to a select sample of the thirty-five companies listed on the IBEX-35 of the Madrid Stock Exchange, represent, in this first examination adopting comprehensive income on an all inclusive scale and applying the IFRS of the IASB, a point of reference for investors and analysts, as well as for economists in the undertaking of their professional activity, especially with respect to the economic and financial analyses of companies from a perspective that better represents the reality of the markets as is the case with comprehensive income and, therefore, places it

further from the principles of historical cost and the prudence upon which traditional income have been sustained.

But this way of conceptualising traditional business performance departs from the traditional thinking that has prevailed in models of financial reporting throughout the 20th century, in particular that orientated towards accountability and control, such as what has happened in Latin-American countries and Continental Europe; which requires a change in mentality with regard to how company performance is understood, becoming more and more orientated towards satisfying the needs of investors, which are considered users of reference in Anglo-Saxon accounting models, something which is gaining more and more global reach with the adoption of the IFRS of the IASB.

Finally we consider that even taking into account the limitations of the ratios produced from accounting information, such as those under research herein, the results of our paper may represent a contribution to the debate which is stirring within the “Financial Statements Presentation” which is being developed jointly by the IASB and the FASB, as based on the statistical evidence provided not only justifying the inclusion in the Notes of Earnings per Share calculated according to comprehensive income, but also its disclosure in a much more prominent and relevant way in the main body of the Statement of Comprehensive Income.

STOCK MARKET, TAX REVENUE AND ECONOMIC GROWTH: A CASE-STUDY OF DEVELOPING ASIA

Roshaiza Taha, Monash University
Sisira R.N. Colombage, Monash University
Svetlana Maslyuk, Monash University

ABSTRACT

The purpose of this paper is to establish the plausibility of stock market and taxation revenue as a tool to boost economic growth using time series data of ten developing Asia countries over the period of 1990 to 2008. We conducted a stationary test of the variables, followed by cointegration analysis and multivariate Granger causality. This study reveals that, in the case of China, we find strong evidence in support of the relationship between each of the examined variables. There is however mixed findings for other countries. This paper is only preliminary analysis. The number of countries to represent the developing Asia is very limited. The paper is the first to examine such relationship especially within the developing context. This paper contributes to the literature by offering a holistic view of the role of government revenue and stock market as they pertain to economic growth. The results are significant for investors, the authority and the policymakers.

KEYWORDS: Economic growth, government revenue, stock market, developing Asia

INTRODUCTION

Developing Asia's robust recovery from the global crisis is without a doubt an outstanding achievement. In a recent exercise, the Asian Development Bank (ADB) emphasised that policymakers must turn their focus to ensuring strong medium and long-term growth. Thus there is a need for policies that develop the region's productive capacity through both factor accumulation and factor productivity for the sustainable of growth. This paper contributes to knowledge in this area through an examination of the role of government revenue and stock market towards economic growth. The results from this study provide evidence of a stable relationship between these variables and suggest that the policies relating to enhance economic growth should be directed towards the creation of transparent and mature stock market which will further boost the collection of government revenue.

LITERATURE REVIEW

In the early models of economic growth (neoclassical growth theory), saving rates and population growth rates were highlighted as importance determinants of income per person. A large and diverse body of theoretical and empirical literature has investigated the important role of the financial system (Odedokun, 1998; Ram, 1999; Beck, Levine and Loayza, 2000; Naceur, Ghazouani and Omran, 2007; Kyereboah-Coleman and Agyire-Tettey, 2008; Akimov, Wijeweera and Dollery, 2009) or fiscal policy (Karran, 1985; Barro and Sala-i-Martin, 1992; Futagami, Morita and Shibata, 1993; Lee and Gordon, 2005) on the development of economic growth. These studies have proved the pivotal role of taxation and financial system on economic growth. Research the relationship between taxation, financial system and economic growth is remains scanty. The theoretical underpinning behind this relationship can be traced back to the work of Levine (1991) whereby an endogenous growth model performance of economic growth is influenced by stock market activities and taxation policy. Concentrating on investment as the financial variable, Romero-Ávila and Strauch (2008) and Soli et.al (2008) empirically examined and proved the

existence of this relationship. Though these studies support Levine's view there is a need to expand the examination to include other financial variables. Further little research attention has been paid to this issue in developing Asian Economies.

DATA AND METHODOLOGY

This study uses time series data from 10 developing Asia to include Bangladesh, China, India, Indonesia, Malaysia, Pakistan, Philippines, Sri Lanka, Thailand and Vietnam from 1990 to 2008. These countries were selected based on the 26 developing countries specification from the International Monetary Fund (IMF). Other countries are not included due to the non-availability of the data. The data was secondary in nature and collected from the DataStream, World Bank and International Financial Statistics. The data used was annual values of real GDP, government revenue and stock market capitalization. The analyses converted all variables into logarithmic form.

The empirical analysis in the present study is based on cross sectional multivariate Granger-causality tests within error correction framework. The standard for this approach is that often a long-run equilibrium exists between the examined. However there might be a disequilibrium in the short run. Therefore with the error correction mechanism, a proportion of the disequilibrium in one period is corrected in the next period. As the vector error correction model (VECM) specification only applies to cointegrated series, we therefore need to conduct the unit root test and cointegration test prior to this. Our research adopted augmented Dickey Fuller (ADF) to check for the stationarity and Johansen cointegration test proposed by Johansen's (1988) and Johansen and Juselius' (1990). If there is an evidence of cointegration among all the variables, the VECM specification represent in the following form:

$$EG_t = \alpha_1 + \beta_1 ECT_{t-1} + \sum_{j=1}^n \gamma_{1j} \Delta EG_{t-j} + \sum_{j=1}^n \gamma_{1j} \Delta TR_{t-j} + \sum_{j=1}^n \phi_{1j} \Delta SM_{t-j} + u_{1t} \quad (1)$$

where EG, TR and SM represent the economic growth, total revenue and stock market respectively. This equation is repeated by changing TR and SM as the dependent variables.

EMPIRICAL RESULTS

To begin our analysis we conducted ADF unit root test to check the stationarity and the order of integration of these variables with or without trend. The unit root results are presented in Table 1. The unit root result suggested that all of the variables are trend non stationary in level but stationary after first differencing. Therefore except for EG for Bangladesh all series are I(1) variables at conventional levels of significance.

Based on the unit root test we then proceeded with the Johansen cointegration test. In this analysis Bangladesh and Taiwan was excluded since this approach is only applicable for I(1) series. The Johansen cointegration test results are presented in Table 2. Similarly in this table we exclude Sri Lanka since there is no cointegration indicates between variables. Based on this analysis we found at least one cointegrating variables for each of the country.

Table 1: Unit Root Tests

Variables	Tax	Lags	Stock Market	Lags	Economic Growth	Lags
Level (Without Trend)

Vietnam	$r = 0$	57.62**	34.91	41.07	39.14**	22.00	26.81
	$r \leq 1$	18.48	19.96	24.60	11.87	15.67	20.20
	$r \leq 2$	6.64	9.24	12.97	6.64	9.24	12.97

Note: r is a number of cointegrating vectors. According to the AIC criteria the lag length is selected to be 1. *** and ** denotes rejection of the hypothesis at 1 and 5 percent significance level.

Following the cointegration test we then estimated the trivariate model based on equation 1 for each of the remaining countries and the results are reported in Table 3. From this analysis, if the examined variable shows a significant result it means that the variables are adjusting to disequilibrium from the long run relationship, while the insignificant variables indicate that the variables do not significantly respond to deviations from long run relationship. To converse the space we only reported the countries which have significant VECM results. From Table 3 we can see that for Indonesia, Malaysia and Philippines, all variables show significant error correction term whereas for Thailand and Pakistan there are no significant results shown for all variables.

Table 3: Vector Error Correction Estimation for the Trivariate Model

Dependent Variable		Countries					
		China	India	Indonesia	Malaysia	Phillipines	Vietnam

		[-0.08]	[0.62]	[1.53]	[2.10]	[2.25]	[0.87]
	Constant	0.022	-0.071**	0.066**	-0.218***	-0.062**	-0.10***
TR		[1.57]	[-0.79]	[0.14]	[-1.04]	[-1.50]	[-1.55]
	ECT _{t-1}	0.031	0.144	0.136	-0.008	0.0294	7.276
		[1.65]	[2.44]	[1.37]	[-0.19]	[1.50]	[1.43]
SM	Constant	0.025***	0.080	0.784**	0.845***	-0.099**	39.100
		[3.31]	[0.33]	[0.73]	[1.79]	[-0.86]	[1.63]
	ECT _{t-1}	-0.839	-0.195	-0.1612	-0.005	-0.096	3.218
		[-3.32]	[-0.97]	[-2.30]	[-0.03]	[-0.56]	[1.91]
	Constant	0.699***	-2.864***	-3.151**	2.708***	-2.431**	11.094
		[6.94]	[-3.50]	[-4.22]	[1.52]	[-2.30]	[1.39]

Note: * and ** denotes significant at 1 and 5 percent levels respectively. Figure in the parentheses is t statistic.

Further we carried out the causality test to observe the direction of causality between variables and the result is reported in Table 4. This shows there is unidirectional relationship exist between government revenue and economic growth for China, Malaysia, Philippines, Thailand and Vietnam whereas noncausality has been reported for other countries. This indicates that causality running from government revenue to economic growth suggest that government revenue is the major driver of strong economic growth for these countries This highlights for these countries the importance of to strengthen the process of revenue collection to enhance the growth performance.

For the relationship between stock market and economic growth we do find the bidirectional for China , unidirectional causality for India, Malaysia and Pakistan while no causality for the others. In the case of China, the causality for stock market and economic growth runs in both directions showing that they influence each other. Therefore prudent policy towards the development of stock market activities may have a positive bearing on the economic growth for India, Malaysia, Pakistan as well as China. Finally referring to the relationship between stock market and economic growth only a unidirectional relationship exists running from stock market towards growth for China, Pakistan and Philippines. These results suggest that the stock market leads to the increase in government revenue collection. Conversely there is no significant impact on the performance of changes in government revenue collection on the stock market activities.

Table 4: Causality Tests In Trivariate Model Involving EG, TR And SM

Null Hypothesis	Direction of Causality		
	GR-EG	SM-EG	SM-TR
China	Unidirectional	Bidirectional	Unidirectional
India	Noncausality	Unidirectional	Noncausality
Indonesia	Noncausality	Noncausality	Noncausality
Malaysia	Unidirectional	Unidirectional	Noncausality
Pakistan	Noncausality	Unidirectional	Unidirectional
Philippines	Unidirectional	Noncausality	Unidirectional
Thailand	Unidirectional	Noncausality	Noncausality
Vietnam	Unidirectional	Noncausality	Noncausality

This table shows the direction of causality between economic growth, government revenue and stock market for the examined countries.

CONCLUSION

This paper's examination of the relationship between economic growth, government revenue and stock market based on trivariate Granger-causality approach within error correction framework for 10 developing Asia (excluding Bangladesh and Sri Lanka due to the insignificant results after unit root and cointegration analysis) shows there is evidence of a strong relationship between variables in the case of China. This underlines the importance to the Chinese government of monitoring the performance of all relevant economic indicators to sustain strong economic growth. Other countries, however, may be better served by harnessing the role of government revenue and stock market for future economic growth and this perhaps highlights the need for governments of these countries to streamline their policies and regulations towards financial and fiscal policy.

APPLICATION OF DATA ENVELOPMENT APPROACH (DEA) TO TEST BANKING EFFICIENCY

Namita Rajput, University of Delhi, India

ABSTRACT

The paper attempts to examine the efficiency of the banking sector in India. India being a developing country with wide industrial base relies heavily on the banks for their credit demands. There have been many previous studies which have considered different models for checking the efficiency of the banks. The prime focus was to measure the lending efficiency of the banks. This takes into consideration the model in which one can measure loans as output and assets and deposits as inputs. In other words how well banks are transferring funds from house-holds to the industries, thereby performing the basic task for which they have been conceived. From deposit mobilization to lending a comparison was made and found that there is no significant difference between private and public sector banks. Also there has not been significant increase in the efficiency of bank. The paper concludes that, as the economy grows and more and more opportunities come into the system banks must focus on increasing their efficiency so that they can provide a firm support in the financial market for the industries to develop.

INTRODUCTION

Reserve Bank of India (RBI) was constituted as an apex bank without major government ownership. Banking Regulations Act was passed in 1949, with wide ranging powers for supervision, control, licencing powers and inspection of the banks. RBI acquired control of the Imperial Bank of India, which was renamed as State Bank of India. In 1959, SBI took over control of eight private banks floated in the erstwhile princely states, making them as its 100% subsidiaries. RBI was empowered in 1960, to force compulsory merger of weak banks with the strong ones, this resulted in reduction of banks from 566 in 1951 to 85 in 1969. In July 1969, government nationalised 14 banks having deposits of Rs.50 crores and above, so that banks can play the role of catalytic agents for economic growth. The Narasimham Committee report (1991) suggested wide ranging reforms for the banking sector to introduce internationally accepted banking practices.

REVIEW OF LITERATURE

Analysis of efficiency of financial institution has gained a lot of importance in the last few years. Various approaches have been defined to determine the efficiency of the financial institutions. These approaches broadly fall under two types-parametric and non parametric. The primary difference between these as explained by Berger and Humprey (1997) is the assumptions imposed on the data in terms of

- a. The functional form of the best practice frontier
- b. Consideration of random error
- c. If there is a random error the probability distribution assumed for the inefficiencies.

Thus the shape of the frontier and the distributional assumptions on the random error and inefficiency are key parameters on which the main approaches to determine the efficiency of financial institutions differs. The non parametric programming was initiated by Charnes et al. They gave relatively little specification of the best practice frontier as in the case of nonparametric approaches such as Data Envelopment Approach (DEA) and Free Disposal Hull (FDH). The most widely used nonparametric technique is DEA, as it is proven to be valuable tool for strategic, policy and operational problems, besides to develop

benchmarks. At present, DEA has been widely accepted as a tool to measure the efficiency of the financial institutions over the parametric methods.

Bauer et al (1996) applied different approaches to the study of the efficiency of the US banks over the period 1977-88. They found that nonparametric methods were generally consistent with each other as far as identifying efficient and inefficient firms were concerned, but parametric and nonparametric measures were not consistent with each other. The wide acceptance of DEA as a measurement tool for measuring efficiency of the financial institution can be attributed to certain strengths of this approach. The main advantages of using DEA are as follows. The data may not necessarily assume any functional form. DEA leads to a comparison of one Decision Making Unit against peer or combinations of peer. The units of input and output may vary as they do not affect the value of efficiency measure. This model can handle multiple inputs and outputs. However, there are a few limitations as well. There is no assumption of statistical noise, thus the noise element gets reflected in the measured inefficiency of the DMU. Further DEA does not give absolute efficiency measures. DEA results are sample-specific. An inherent limitation of this nonparametric method is that it makes hypothesis testing difficult.

The Constant Returns To Scale Model

Charnes et al ((1978) proposed this model with the assumption of constant returns to scale. It's also called the CCR model after the researchers Charnes, Cooper and Rhodes. The present study suggests that banks produce certain inputs to produce certain outputs. Thus, the efficiency of banks is measured in terms of how efficiently they are able to utilize their inputs given their outputs. In this model, efficiency is measured by the ratio of weighted outputs to weighted inputs. The ratio is of the form:

$$\frac{u_1 y_1 + u_2 y_2 + \dots + u_n y_n}{v_1 x_1 + v_2 x_2 + \dots + v_n x_n}$$

Where u and v are weights for output (y_1, \dots, y_n) and inputs (x_1, \dots, x_n) respectively. Assume that for each of the n firms there is a data on K inputs and m outputs and represented by column vectors x_i and y_i respectively for the i^{th} firm. This may be expressed as $u'y_i / v'x_i$ where u is MX1 vector of output weights and v is KX1 vector of input weights. To arrive at the optimal weights, we define the following linear programming model as :

$$\begin{aligned} &\text{Max}_{u, v} (u'y_i / v'x_i) \\ &\text{s.t.} \\ &u'y_i / v'x_i \leq 1, \quad j=1, 2, 3, \dots, n. \\ &u, v \geq 0 \end{aligned} \quad \dots \quad (1)$$

Solving Eq. 1, values for u and v may be obtained such that the efficiency measure for each firm is maximised. A pertinent constraint with this model formation is that it can have infinite number of solutions. Thus an additional constraint is added, $v'x_i=1$, so the problem can be removed. The new model, known as the transformation model, thus becomes

$$\begin{aligned} &\text{Max}_{u, v} (u'y_i) \\ &\text{s.t.} \\ &v'x_i = 1 \\ &u'y_i - v'x_i \leq 0, \quad j=1, 2, 3, \dots, n. \\ &u, v \geq 0 \end{aligned} \quad \dots \quad (2)$$

This form in Eq. 2, is known as the multiplier form of the DEA linear programming problem. Using duality in linear programming, an equivalent envelopment form of this problem may be obtained.

$$\text{Max}_{\theta, \lambda} (\theta)$$

s.t.

$$-y_i + Y\lambda \geq 0$$

$$\Theta x_i - X\lambda \geq 0, \quad j=1, 2, 3, \dots, n.$$

$$\lambda \geq 0$$

..... (3)

where Θ is scalar and λ is a $N \times 1$ vector of constraints.

The efficiency for the j^{th} DMU is reflected by the value of Θ .

For each DMU taken in study a separate linear programming model would be solved. The technically efficient DMU will have a $\Theta=1$, and all other DMU will have a $\Theta < 1$, implying that the efficiency scores of all other DMU's will be measured relative to the technically efficient units that have a score of $\Theta=1$. In this study, each bank under observation is considered a DMU.

RESEARCH METHODOLOGY

The paper evaluates the technical efficiency of the banks operating in India using the DEA methodology. An important aspect in the dynamic business environment, in the wake of continuous reforms initiated by the RBI, is that the efficiency scores may vary from year to year. Hence a separate frontier was derived for each of the years taken during the study period.

Choice Of Input And Output

It has been a matter of constant debate when it comes to defining inputs and outputs. There are mainly two approaches that have been discussed in existing literatures. The first is the 'intermediation approach'. Here banks are viewed as intermediaries between the provider of the funds and users of the funds. In this approach, deposits are regarded as being converted into loans. This approach takes into account interest expense, which accounts for a large proportion of bank's cost. In this approach, output may be taken as money value of deposits and loans, and the inputs considered include money value of labour, fixed assets and equipments, and loanable funds. In contrast the second approach, 'production approach' is the one in which banks are considered to be producing deposits and loans using capital and labour. This approach takes into account physical quantities of input and output, and does not assign monetary value to inputs or outputs. This approach does not take into account the interest costs, hence the criticism. The paper uses the second approach. The data has been mostly secondary data i.e. collected from various places like, Prowess, BSE website, reports published by Govt. of India, Annual Reports of Banks etc.

Sampling Unit

The banking index of BSE i.e. BANKEX served as the sampling for the data because it is a robust measure for measuring the performance of the banking sector of India. It has been scientifically designed and therefore provides the basis for the calculations and functions used to analyse the data. The study is based on a period of six years i.e. 2004-2009. Thus all the data used pertains to the same period.

On the basis of average performance of the five years IDBI, Oriental Bank and Kotak Mahindra were top performers. But if the last year's performance is seen then Kotak Mahindra, ICICI and Yes Bank has fared well. One of the most worst performing bank has been SBI which scored last on the previous year and eleventh on the average.

So far as the difference in performance of the private sector and public sector banks are concerned very significant differences were not found. In terms of giving loans both public sector and private sector banks have performed equally.

RESULTS-ANALYSIS AND INTERPRETATION OF DATA

Table 1: Efficiency of Banks

	ranking on the basis of average	ranking on the basis of the last year
1	IDBI	Kotak Mahindra
2	Oriental Bank	Yes Bank
3	Kotak Mahindra	ICICI
4	Yes Bank	IDBI
5	Bank of India	Axis Bank
6	Indian Overseas Bank	Federal Bank
7	Canara Bank	IndusInd
8	Karnataka Bank	Karnataka Bank
9	Punjab National Bank	Indian Overseas Bank
10	Union Bank of India	Canara Bank
11	State Bank of India	Bank of Baroda
12	Federal Bank	Bank of India
13	ICICI	Punjab National Bank
14	Bank of Baroda	HDFC
15	Allahabad Bank	Union Bank of India
16	Axis Bank	Oriental Bank
17	HDFC	Allahabad Bank
18	IndusInd	State Bank of India

The table shows the efficiency of banks based on BANEX from 2006 to 2009

Table 2: Public Vs Private Banks (Group Statistics)

	public_vs_	N	Mean	Std. Deviation	Std. Error Mean
Efficiency	Public	60	.7473	.16376	.02114
	Private	48	.7360	.20098	.02901

The table depicts the difference between the efficiency of private and public sector banks

Table 3: Independent Sample Test

Independent Samples Test										
			Levene's Test for Equality of		t-test for Equality of Means					
			F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference
efficiency	Equal variances assumed		.942	.334	.320	106	.749	.01124	.03509	Lower: -.05833 Upper: .08081
	Equal variances not assumed				.313	89.968	.755	.01124	.03590	Lower: -.06008 Upper: .08255

The table shows the T and F statistics IDBI has performed significantly different from all other banks but In a negative sense

Table 4: Bank Wise Dependent Variable Efficiency

Dependent Variable:efficiency		Mean Difference	Std. Error	Sig.	95% Confidence	
(I) company_wise	(J) company_wise				Lower Bound	Upper Bound

	Yes Bank	-.52431*	.16583	.002	-.8538	-.1949

This table is an extension of Table 3 it shows the bank wise statistics

Figure 1: Bankex Vs Sensex Regression

This figure shows the correlation between Banex and Sensex

As observed by the graph there exists a very high correlation between Sensex and Bankex, this is due to the fact that banking and economy are very closely related and hence they follow each other closely.

Table 6: Regression Output

Regression			
Regression Statistics		Coefficients	
Multiple R	0.977975708		
R Square	0.956436486	β_0	-327.5508226
Adjusted R Square	0.95587798	β_1	0.555338589
Standard Error	543.4932694		
Observations	80		

Depending on the Sensex one can predict the Bankex future as $\text{Bankex} = 327.5508226 + 0.555338589 * \text{Sensex}$

Year wise Comparison: On applying T-test it was found that there is not much significant difference in efficiency between the years except for the year 2004 and others. This explains that banks have not been increasing their efficiency and continue to go at the same pace.

Table 7: Year wise efficiency

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
2004.00	18	.5836	.24590	.05796	.4613	.7059	.00	1.00

This table shows the future prediction up to year 2015

The following sectors are the sunrise or priority sectors of the Indian Market. Either they do not have investors ready or they are being developed by govt. The banking sector has more or less neglected the growth opportunities in these sectors. Based on the different statistics predicted by Govt. of India and McKinsey, the various growth rates have been taken into consideration and growth predicted at the given rates predict that by 2015 banking sector is going to grow at about twice the volume it is operating at now.

But the problem with the previous growth model was that all the sectors are not capable of absorbing the same amount of funds, hence there are funds that are left unused. The solution could be that the funds at the end of each year are invested at the ratio in which they are invested now.

Table 11: Future predictions for other sectors

State Bank of India	0.646781	0.792362	0.747745	0.864662	0.934084	0.396234
Union Bank of India	0.600647	0.803287	0.793875	0.838291	0.731377	0.629873

CONCLUSION

The efficiency of banks has been more or less remained the same over the years except for the year 2004 from which there has been significant improvement. There is not much difference in the efficiencies of Private Sector and Public Sector Bank. There is significant difference in the efficiencies of IDBI and other banks. If we see the investment patterns and predict at the low level growths as predicted by govt. of India and other institutions, the banking sector is expected to grow to double of the present conditions.

THE CURRENT STATE OF INTERNATIONAL REPORTING

Peter Harris, New York Institute of Technology

Raja Nag, New York Institute of Technology

Steven Shapiro, New York Institute of Technology

Katherine Kinkela, New York Institute of Technology

With the advent of the current worldwide financial crisis, there have been increased pressures by the investment community to standardize accounting standards on a worldwide basis. Arguments have been made that differing accounting reporting by multinational corporations has negative ramifications leading to problems of comparability and accounting engineering, thereby contributing in a major way to the current financial crisis. To this end there are plans in motion by the SEC in conjuncture with the International Accounting Financial Accounting Standards Board (IAFSB) to standardize accounting standards, on a worldwide basis with a target date set for periods ending after December 31, 2014. This paper discusses the possibility of this occurrence, the roadblocks and challenges presently being faced as well as the advantages of a single worldwide accounting reporting standard setting body. The major differences in financial reporting between US GAAP and IFRS are also addressed.

COUNTERPARTY RISK IN CREDIT DEFAULT SWAPS MARKETS, MULTIPLE QUESTIONS TO BE CHECKED.

Jamal Mattar, University of Liege - Belgium
Danielle Sougne, University of Liege – Belgium

ABSTRACT

One of the most striking financial developments of recent decades is the tremendous increase in credit derivatives as tools allowing a financial institution to unbundle the nominal amount of a loan from its associated credit risk. The Credit Default Swap "CDS" constitutes the major type of this market. Financial markets innovate constantly and with each innovation, questions arise whether they are beneficial or not. With the ongoing internationalization debate about whether, and to what extent, unregulated CDS market are responsible for the recent financial crisis, the assessment of the risks associated with this trade belongs to one of the most stimulating topics in economics, business and international finance. This paper provides an in-depth looks critical review of literature on this subject. After defining and explaining what CDS and its counterparty risk are, we then link it to the recent financial turmoil especially the debate whether this unregulated market had aggravated the situation. After this, we will check the theoretical and empirical work done on the issue of linking the CDS counterparty risk to the financial stability. We conclude by identifying several avenues for future research.

KEYWORDS: Credit Default Swaps, counterparty risk, financial crisis.

INTRODUCTION

In the late 1990s and early 2000s, the most exciting developments in derivative markets have been in the credit derivatives area; banks have made extensive use of credit derivatives to shift the credit risk in their loans to other parts of the financial system. A credit derivatives as a group of financial instrument is a security that allows investors to transfer credit risk to other investors who are willing to take it. Their purpose is to trade the default risk and to manage it differently to when it stays on the financial institutions' balance sheet. The credit derivatives area includes a variety of financial instruments, which have a common purpose but not necessarily common characteristics. Kiff, Michaud, Mitchell (2003) made an analytical review of Credit Risk Transfer "CRT" Instruments: forward agreements, swaps and options are the three main buildings for devising most credit derivatives. Our aim in this paper is not to study all major types of credit derivatives.

We will focus rather on Credit Default Swaps "CDS" as a major (they account 70% of credit derivatives market in 2007 according to Bank for International Settlements statistics) and recent type (its first version was in 1998) of CRT. It is our purpose in this paper to present a comprehensive review of literature on this recent financial innovation, attempting to synthesize much of the recent work within common framework rather than summarizing the contributions of individual papers. Financial markets especially nowadays in a globalization and deregulation prominent world, innovate constantly and with each innovation, questions arise whether they are beneficial or not. It would be useful to check the effect of unregulated counterparty risk in CDSs markets on the financial days.

The remainder of the article is organized as follows. After we define briefly the terminology, we will see in section 3 some of the debate over the role of CDSs markets in triggering the 2008 financial crisis. Section 4 provides analysis of counterparty risk in this market from many angle of observation. The last part concludes the paper.

TERMINOLOGY DEFINITION

In this section we will define CDSs markets and check over the literature some of the ongoing debate on the consequences of CRT for financial stability

CDS Definition

Heyde and Neyer (2010) defined a CDS as a type of over-the-counter (OTC), or non-exchanged traded contractual agreement in which one party (protection seller) promises to pay another party (protection buyer) in the event that a third party triggering a credit event such as bankruptcy, default payment, debt restructuring....

Figure 1: CDS contract mechanism in a schematic way

This figure illustrates in a simple way the CDS swaps mechanism as the most common credit derivatives. The reference Asset could be either an entity (Entire Corporation or a sovereign) or an obligation (a loan, or a debt instrument like a bond)

Notice that in the figure, there is no line between reference asset and the investor because an important CDSs feature is that the protection buyer may not need to own or otherwise be exposed to the risk of the reference obligation and hence allows parties to trade (or speculate on) the credit risk of debt obligation such as bonds. That is what we called “Naked” or “speculative” CDS trading.

CDSs’ types differ according to the underlying debt that insure. The most common is the single-name CDS, which covers debt on corporate debt issuers either a single company or a country. The second type is the CDSs index, which covers debt on a composite of corporate entities up to 125 reference entities with some theme in common, such as all being American or European investment-grade companies or securities backed by mortgages. Currently, there are two main families of standardized CDS contracts (appeared in 2004 and marketed by the Markit Group): the Dow Jones CDX IG “include reference entities in North America and emerging market, and iTraxx families “include corporate reference entities in the European and Asian markets.” An additional category of CDSs reference asset-backed securities such as mortgage related Collateralized Debt Obligation “CDO.”

Debate Over Credit Derivatives Markets

The credit derivatives markets have changed the risk management practices by the ability to trade credit risk in financial markets. The rapid growth of this market has evoked an ongoing debate on the consequences of CRT for financial stability. Some see that it could have a negative impact on the stability; others focused on the other hand on their beneficial impact for the efficiency of bank financing. This issue has received the attention of policy makers and researchers worldwide.

To make a view on the relevant literature about this debate, we will draw the following table.

Table 1: the relevant literature on the consequences of CRT for financial stability

Author	Year	Negative impact	Positive impact
Santomero and Trester; Instefjord; Morrison	1998; 2005; 2005	CRT increase bank's risk taking Credit derivatives can reduce welfare by leading to disintermediation	
Drucker and Puri	2006	CRT undermine relationship banking	
International Monetary Fund "IMF"	2006	CRT can reduce the transparency about who owns credit risk	
Brown and Wong	2002		Hedging and diversifying credit risk
Wagner and Marsh	2006		Shedding risk outside the fragile banking sector
Altman et al	1998		Entering into contingent contracts "off-balance-sheet" will offset the risk
Rule	2001		Allocation of risk among participants; capital requirements relief

This table summarizes some arguments with and against the developments of this market. Arguments against the credit derivatives markets insist on their drawbacks sides by destabilizing the institutions, which buy credit risk, or by insisting that once a Financial Institution "FI" diversifies its risk, it will be encouraged to increase and take on new risks. However, the proponents of CRT emphasize on their beneficial effects, in particular the diversification of risk management.

CREDIT DEFAULT SWAPS AND THE RECENT FINANCIAL CRISIS

The month of September 2008 was deeply marked by a profound global financial crisis. The financial crisis had begun in the second half of 2006 with the crash of real estate loans "the subprime" in the United States, which borrowers often with modest conditions have stopped repaying. What impresses is the extent of its spread, its impact on other markets, and uncertainty about the conditions of its outcome.

When it comes to assess the financial crisis causes, opinions differs:

Some such as Jenkinson, Penalver, and Vause (2008) concentrate on the risky behavior taking by financial institution (irrational behavior and moral hazard problem, lack of transparency of new and complex product, the ability of banks to manage their exposures with their internal risk system based mainly on value at risk models) and the imperfections in the securitization process (information asymmetry, complexity of the process, drawbacks of risk segmentation);

Others (Blunder-Wignall and Atinkson, 2009; Gramlich, 2007) focused on compensation schemes in the financial sector, which encouraged excess risk taking such as the unregulated OTC market, or poor underwriting standards and lack of regulation of mortgage brokers.;

Some scholars and law makers (Security Exchange committee "SEC," European Commercial bank "ECB") asked on the role have played the credit rating agencies during the crisis. They claimed that credit rating agencies had improperly managed conflict of interest and said the methodology used by them to approve the legality of the structure product created and to rate the various seniorities of debt issued by Collateralized Debt Obligation "CDO" should be reviewed.

A discussion of the causes and consequences of the crisis is beyond the scope of this article, see for this purpose Brunnemeier (2008) who describe and analyze the many triggers and mechanisms by which the crisis has emerged and spread on the main financial places. We will focus instead on the debate, whether and to what extent, unregulated credit default swaps are responsible for the crisis:

Many argued that systemic risk arising from CDSs would have exacerbated the crisis by creating asset bubbles (CDSs allow banks to lend more freely to unworthy "Junk" borrowers, and at lower interest rates

to compete effectively with the market and with other FI such as mutual fund or investment bank), by altering the relationship banking as a main comparative advantage for banks over the other FI (see Boot “2000” article), and by letting few market participants to endanger the whole financial system “too big or too interconnected to fail”. In a related article, Coudert and Gex (2010) showed empirically the effects of big institution “case of GM and Ford” bankruptcy to the CDS markets. Thus, perhaps certain group of big market players such as “AIG, Lehman Brother’s” may have the appetite for risky bets, but should these bets fail (without properly anticipating the amount of collateral or the risk that its counterparties would be unable to pay), the whole financial system will bear the consequences;

Others saw, on the other hand, CDS market has absorbed losses without significant contagion. Proponents of this market claimed that CDSs was not a cause for the crisis; it was just the effect of losses on mortgage securities. Borrowers who got benefit from the low interest rate, and the house booming period during the period 2002-2006 has continued to purchase more and more residential housing, driving up the value of most houses beyond their “fundamental value”. Thereby, contribute to form an asset bubble. In 2007, once sub-prime borrowers began to default on their obligation at an accelerating rate, the housing bubble burst. What have contributed the spread of the crisis are securitization and the CDO linked to mortgage risk real estate “subprime.” Investors, including most large financial institutions, had to write down the value of these toxic assets on their balance sheets to market value (fair value recent debate). Because of these write-downs, numerous large financial institutions became insolvent, including Bear Stearns, Freddy Mae, Fanny Mac, Lehman Brothers, Countrywide Mortgage, Merrill Lynch, and the list goes on.

As we remark, there is a debate over the role of CDS in the last financial crisis. If this hypothesis could be proved that “FI would not have purchased so many CDOs had they been unable to obtain CDS hedges,” then it logically follows that CDSs has been involved in the crisis. To our knowledge, there is no empirical evidence on this specific issue.

COUNTERPARTY RISK IN CDS MARKETS

The main risk associated in CDSs markets are counterparty risk when one part of the contract cannot meet its obligation and systemic risk (sudden, often unexpected, events or series of events that damage financial markets, and thereby the efficient channeling of resources) caused by the interconnectedness of this market.

As the CDSs markets, is a non-standardized market “OTC” traded on an exchange and not on a regulated market, counterparty risk is high. There is no clearinghouse to underwrite commitments through a system of margin calls and collateral. Besides, it constitutes a channel of contagion of the type “cascade effect” to the financial system. The failure of a major play such as Lehman Brothers or AIG can thereby aggravate systemic risk. Once the debate about the CDS’s role in financial crisis seems to be over by admitting that it has contributed to enhance the impact of credit crisis, debate continues about the procedures should be taken to limit the drawback impact of its counterparty risk.

We will make a step toward this issue by checking the problem from a regulation (Part 1) and contagion (Part 2) point of view.

Counterparty Risk And Regulation Question

Critics of CDSs markets claimed that it has been allowed to become too large without proper regulation. Thus, the market has no transparency. Some scholars asked about the moral hazard problem when the protection buyer has more information upon the protection seller. In other words, there will an information asymmetry. In CDS contract, both buyer and seller of protection experience the counterparty

risk. To mitigate the protection buyer counterparty risk, a protection seller may require an upfront payment from the protection buyer upon entering into the CDS.

To reduce counterparty risk's protection seller, CDS market participants sometimes require him to post collateral to protection buyer (usually the amount of collateral required reflects "the contracting parties assessment of the risk"). Say it differently, one the CDSs' spread increase, the amount of collateral should be delivered goes up and vice versa. The parties' adjustment collateral requirements may happen several times per day to account for fluctuations in market values of the CDS contract or changes in the parties' creditworthiness.

However, even with continual collateral adjustments, buyers have difficulty collecting sufficient collateral to account for jump-to-default risk. Further, according to International Standard Derivative Association "ISDA" margin survey 2009, more than one-third of OTC credit derivative exposure is not subject to any collateralization agreement, especially if the protection seller has a high rate (AAA). Thus, despite some mitigation through collateralization, a substantial amount of counterparty risk remains in the bilateral OTC CDS market.

After two decades of impassioned debate, researchers, regulators, legislators and market participants have yet to resolve the question of whether market participants and regulators should enforce authority over the market. The financial turmoil was the trigger to think deeply about this issue. One of the proposals is that the CDS contracts will be traded through a centralized counterparty (CCP), or clearinghouse. A CCP stands between both parties of the transaction so that each party deals only with the CCP and not with the other market participant. It will become the "buyer to every seller and seller to every buyer." Several central clearinghouses have already been established in the United States "U.S." (Frank-Dodd Bill act that was signed into law in July 2010) and the Europe (European Commission 2009).

Does a Central Clearing Counterparty "CCP" of a particular class of derivatives such as CDS indeed reduce counterparty risk exposure? Is it better instead to eliminate the naked CDS trading or to increase capital reserve requirements for market participants involved in the purchase or sale of CDS tied to highly speculative debt? Nowadays, we found some literature (especially working papers) talking about the best way to regulate counterparty risk in CDSs markets.

For instance, Duffie and Zhu (2010) proved in their theoretical model that clearing different classes of derivatives such as CDSs, Interest rate Swaps (IRS) in different central clearing could increase counterparty exposures and collateral demands. Using recent data (year 2009) on the OTC derivatives positions of U.S. banks, they gave an illustrative example for their model. They recommend clearing different classes of derivatives (IRSs, CDSs) in the same clearinghouse. In a related article, Shadab (2010) argued that market participants and regulators should also be aware that the use of CCP might not fully address the counterparty risk and could even increase the risk by introducing a new source of concentrated CDS exposure into the financial system and potentially undermine superior bilateral risk management practices. He suggested accounting rules instead.

Senior bankers said that not only has the CDS market functioned remarkably well during the financial crisis, but also CDSs contracts have been acting to distribute risk just as was intended. They concluded not CDSs themselves that need further regulation, but the parties who trade them.

Gex, Duquerroy and Gauthier (Banque de France, 2009) exposed the advantages and inconvenient of constructing CCP. Dickinson (2008) in his working paper encourages the idea of CCP.

Counterparty Risk And Financial Stability

The concept of stability is slightly vague and difficult to define. What we are interested in is the systemic risk: “the risk in which the default of a firm or a group of a firms will result in the failure of the financial system as a whole.”

In 2008, the subprime crisis spilled over and became the catalysts for a much broader global financial crisis. Much of the intervention by the Treasury and the Federal Government has been motivated by the main objective of avoiding broader contagion and spillovers to other markets and sectors of the economy. In their article Kaminsky, Reinhart and Vegh (2003) made a literature fully review on the main possible channel of contagion. The first channel is described as a liquidity shock across all markets. The second channel of contagion is described as the arrival of negative news “flight to quality” which affects the collateral values or cash flows associated with securities in other markets. The third mechanism of contagion is related to herding behavior when agents in a market are influenced in their investment choice by the choices made by others.

The fourth channel of contagion is through counterparty risk when firm's financial distress or default has adverse effects on other firms, because of their business relationships. Jarrow and Yu (2001) have measured this type of contagion through counterparty risk in the pricing of bonds and credit derivatives such as CDS.

CDSs markets constitute a fertile field to exploit the contagion channel through counterparty risk especially due to the interdependence of firms, which push the credit spreads to co-move during crises. In this market, one market participant in naked CDSs can be both buyer and seller of protection to offset its position. In an illustrative way, if we took the example of Goldman Sachs (see table 2 below) as a major CDS buyer, we notice that the reference entity has 9,895 outstanding CDS contracts referenced to it with a net notional value of \$6.5 billion, but a gross notional value \$94.0 billion.

This means that the average CDS referenced to Goldman has been offset fourteen times; thus, fourteen firms are linked together on this chain of transactions. The participants in the CDS market are some of the most interconnected in the entire economy. Moreover, we can conclude from Table 2 that roughly ten counterparties trade over 80% of the CDS volume. Should one of these firms fail (due to any number of reasons), the CDS market, would perhaps crash immediately. As for example, the failure of Lehman Brothers, which was a major counterparty players on CDSs markets has immediately raised concerns about whether it can fulfill its obligation. The same question could be posed to the collapse of American Investment Group “AIG”.

Jorion and Zhang (2007 and 2009) have mainly provided empirical evidence of contagion through counterparty risk by making a correlation test between counterparty default and CDS premium. They found a positive relation, which means that counterparty risk constitutes a potential additional channel of credit contagion. In a related article, Coudert and Gex (2010) studied using a sample of 226 CDSs on major US and European firms the effect of General Motors and Ford crisis in 2005 to the whole CDSs markets. They found a significant rise in correlations during the crisis episode, which confirm the hypothesis of CDS market is subject to contagion effect through its counterparty risk.

Table 2: Top 25 CDS references Entities by Net Notional Value of Potential Default Payouts

	Reference entity	Gross (USD)	Notional	Net (USD)	Notional	Contracts
1	REPUBLIC OF ITALY	151,640,355,977		17,033,411,245		3,355
2	KINGDOM OF SPAIN	63,690,626,218		14,103,459,173		1,975
3	GENERAL ELECTRIC CAPITAL CORPORATION	87,508,812,002		11,809,245,999		8,959
4	FEDERATIVE REPUBLIC OF BRAZIL	149,362,956,266		11,358,811,789		11,851
5	FEDERAL REPUBLIC OF GERMANY	37,735,584,839		9,854,708,920		738
6	DEUTSCHE BANK AKTIENGESELLSCHAFT	68,481,187,868		8,748,365,784		5,885
7	RUSSIAN FFEDERATION	111,979,517,282		7,678,846,427		7,898
8	HELLENIC REPUBLIC	35,601,996,464		7,557,555,369		1,118
9	MORGAN STANLEY	93,273,636,461		7,188,002,666		10,067
10	THE GOLDMAN SACHS GROUPS, INC	94,039,544,028		6,500,381,025		9,895
11	REPUBLIC OF TURKEY	190,812,225,523		6,310,120,101		14,285
12	MERRIL LYNCH & CO., INC	95,031,516,396		6,262,327,065		10,015
13	FRENCH REPUBLIC	21,649,394,270		5,906,755,480		515
14	REPUBLIC OF KOREA	51,553,104,051		5,383,948,996		4,636
15	COUNTRY WIDE HOME LOANS, INC	84,992,389,586		5,221,086,007		11,938
16	REPUBLIC OF AUSTRIA	16,412,127,895		5,203,043,051		600
17	BARCLAYS BANK PLC	44,552,698,284		5,084,065,164		4,263
18	REPUBLIC OF PORTUGAL	24,526,177,517		4,885,595,283		774
19	SLM CORPORATION	49,084,672,672		4,739,446,163		7,935
20	CITIGROUP INC	66,637,537,330		4,731,325,037		6,502
21	BERKSHIRE HATHAWAY INC.	18,491,414,194		4,722,693,035		2,450
22	UBS AG	30,997,897,750		4,704,229,570		2,915
23	DEUTSCHE TELEKOM AG	67,930,286,934		4,660,998,294		6,885
24	MBIA INSURANCE CORPORATION	53,274,505,998		4,634,987,364		5,957
25	IRELAND	17,295,994,579		4,600,476,623		628

Source: DTCC Deriv/SERV Trade Information Warehouse Reports, DTCC Website, available at <http://www.dtcc.com/products/derivserv/data/index.php>

This table presents the top 25 reference entities by net notional value (as of Nov. 14, 2008). One market participant in naked CDSs can be both buyer and seller of protection without limits to offset its position. For example Goldman Sachs (see row 10) as a major CDS buyer, has 9,895 outstanding CDS contracts referenced to it with a net notional value of \$6.5 billion, but a gross notional value \$94.0 billion. This means that the average CDS referenced to Goldman has been offset fourteen times; in other words, fourteen firms are linked together on this chain of transactions.

Theoretically, Heyde and Neyer (2010) have analyzed the consequences of CDS for the stability of the banking sector (banks as both buyer and seller for CDS). They found that CDS create a possible channel of contagion because they imply that banks have contingent claims on each other. Allen and Carletti (2006) worked in the context of a bank as a main buyer and insurance as a seller for CDS. They showed that risk transfer between the banking sector and the insurance sector could lead to contagion from the insurance to the banking sector as the credit risk transfer induces insurance companies to hold the same assets as banks. If a crisis happened to the insurance sector, insurance companies will have to sell these assets forcing down the price, which implies the possibility of contagion to the banking sector since banks use these assets to hedge their idiosyncratic liquidity risk. We did not find in the literature neither theoretical nor empirical work, which analyze the context of hedge funds or monocline insurers as a main counterparty in CDSs markets.

CONCLUSION

Credit derivatives allowed market participants to trade and manage credit risk in much the same way as market, interest rate or foreign risk. According to DTCC and British Bankers' Association, the most commonly used credit derivatives instrument is the Credit Default Swaps capturing nearly more than half of the credit derivatives market's share.

We made in this article a short survey of the literature about CDS. We defined it in the first section as an insurance contract that provides insurance against the risk of a default by particular company. It includes single-name credit default swaps, basket credit default swaps, and CDSs indexes. Then, we saw some literature of the debate over its advantages and disadvantages to the health of the financial system.

CDS transactions are traded almost exclusively in the OTC market. Some scholars have argued that this unregulated market is not transparent, and pricing information on CDS is not publicly available. Thus, they saw that this opaque market has contributed to the recent financial crisis. Others saw that CDSs market do not constitute a cause for the crisis but rather an effect for the tremendous increase of risky assets related to mortgage securities. In section II, we linked the CDS market to the recent crisis and we discover that to answer the question whether it has contributed to the crisis or not we had to prove empirically if the FI would not have purchased so many CDOs had they been unable to obtain CDS hedges.

A special attention is made to the counterparty risk in CDS market by checking it from two different but complementary aspects: regulation and contagion angles of observation. We admit that the issue of counterparty risk in CDSs markets needs further analysis by seeing in an empirical part the effect of this risk on financial stability (especially the contagion effect). Then, addressing the regulation measure should be taken to mitigate with the lowest cost possible the counterparty risk in CDSs markets.

Answering to the subject of contagion and regulation in CDSs markets will have a great utility to policymakers because CDS protection sellers were not required by law to set aside capital to meet their obligations (jump-to-default risk). What is more, regulators and market participants were seemingly unaware of the risks that particular institutions (e.g. AIG) had accumulated through their CDS exposures. In addition, the empirical findings could be used to improve the specification of default correlations (by introducing the correlation effect), thus better diversified credit portfolios.

WAREHOUSE AUTOMATION OF A SWITCHGEAR MANUFACTURING PLANT – A CASE

A. K. Biswas, National Institute of Technology – Silchar-India

ABSTRACT

Manufacturing Organizations need to be in constant pursuit of the means that would give their products a “Competitive Edge”. Automated Material Handling, inter alia, has been perceived as an integral part of long-term manufacturing strategy. This paper aims to develop a fully automated warehouse for a Switchgear Manufacturing Plant located in Mumbai. The existing practice is to i) unitize various Switchgear Finished Goods(SFG) except Air-Circuit Breakers(ACB)into ‘Megapacks’ and (ii) palletize the ACBs for delivery to the warehouse by high-lift trucks. SFGs are stored vertically by means of two stacker cranes. Three alternatives viz. (i) floor/overhead conveyors, (ii) CNC gantry cranes, and (III) Automated Guided Vehicles System (AGVS) are zeroed in on. AGVS is found to be the “best suited” option due to its high flexibility, amenability to interfacing with AS/RS, ease of installation & high safety of operation. Design is executed to obtain the type and number of vehicles necessary; the track layout; the traffic flow pattern; decisions regarding provision of control zones; the type, number and capacity of buffers for the vehicles; vehicle dispatching rule; and control system. A transport matrix calculation followed by simulation using SLAM II is done to arrive at the optimal number of vehicles. A low-cost Programmable Logic Controller (PLC)-based control system is recommended.

POSSIBILITIES AND PROBLEMS OF INTRODUCING GENERIC OPTIMIZATION MODELS FOR SMEs IN THE SUB-SAHARAN AFRICA

Mengsteab Tesfayohannes, Susquehanna University

ABSTRACT

Small and Medium Enterprise (SMEs) play a vital role in the sustainable industrial development of the Sub-Saharan Africa (SSA). They need to benefit at least from the minimum use of productivity and efficiency enhancement optimization models. Even the simplest mathematical model application has the potential to help SMEs in promoting their competitiveness and sustainable growth. The application of optimization models has a proven supportive role in streamlining strategic and operational planning process. Therefore, this paper aims to conceptually discuss the feasibility and problems of applying generic optimization methods in the operational planning of SMEs in the SSA nations. This will help to increase the awareness of SMEs entrepreneurs how simple optimization models, if applied successfully, can help SMEs' to improve their efficiency in vital resources utilization activities. The paper will contain generic optimization models with the topologies of suitable applications' modes operandi. Practical application is lacking and will be subject to my next research. Optimization models can also follow heuristic approach as an alternative to using the readily available solution algorithms. This approach will not be discussed in this paper.

KEY WORDS: Small and Medium Enterprises (SMEs), Economic Development, Optimization Models, Sub-Saharan Africa, Decision Sciences, Production Planning.

INTRODUCTION

The society's need for a variety manufactured goods has continued to grow. But the readily available economically valuable products are always scarce, and this scarcity has created the need for efficient use of products and services. This is more apparent in the developing nations as they suffer from wide spread scarcity of resources (Eid, 2009; Dutta and Sinha, 1994; Bazaraa and Bouzahr, 1981). Application of optimization models is helpful for achieving operational efficiency and effectiveness in resource utilization (Madu, 1999; Bazaraa, and Bouzahr, 1981; Salaheldin and Eid, 2007; Anderson, Sweeny and Williams, 1998). At this time, the use of optimization models has become popular and many SMEs have continued to benefit from them in their endeavors to best utilize their resources and rationalize their economic interactions. This has become possible due to a widespread availability of modern, affordable and user friendly software packages.

Optimization models have been widely used as supporting tools in the industrialized countries and the application level is extensive at both private and public socio-economic sectors such as agriculture, industry, environment, health, energy, etc (Verhaeghe, Kfir 2002; Denton and Gupta, 2003; Chattopadhyay, 2001; Hashimoto, Romero and Mantovani, 2003; Piper and Vachon, 2001; Caixeta-Filho, Van Swaay-Neto and De Padua, 2002; Dutta, and Sinha, 1994; Miller, Nemhauser and Savelsbergh, 2003, Stapleton, Hanna and Markussen, 2003; Begen and Puterman, 2003). The application of optimization models has continued to increase and make significant contribution to firms' efforts to achieving strategic objectives. This has been evidenced in various economic success stories in both developed and East Asian tiger nations (Aghezzaf, and Artiba, 1998; Schaller, Erenguc and Vakharia, 2000; Buehlmann, Zuo and Thomas, 2004). In fact, small and medium firms (SMEs) have extensively applied optimization models to streamline their operational tasks and make sound decisions. This helped

them to improve the efficiency and effectiveness of their operational activities (Hodges, 1970; Farashahi, 1974; Kasana, 2003; Hiller, Mark and Gerald, 2001; Hoppe and Spearman, 2001; Altinel, Özcan, Yilmaz, Güneş, 2001).

The application of optimization models in the SSA nations is at its embryonic stage despite the attempt of some researchers and practitioners to apply optimization models in different socio-economic sectors (Cabraal, 1981; Maatman, Schweigman, Ruijs, and van Der Vlerk, M., 2002). In fact, most of optimization models' application attempts have been concentrated in non-manufacturing sectors such as agriculture, energy, environment, finance and investment (Fong, 1980; Bazaraa, Bouzahr, 1981; Cabraal, 1981; Gori, 1996; Madu, Christian, 1999; Maatman, Schweigman, Ruijs, and van Der Vlerk, 2002; Gilbert, E., (2003); Kazuhiko, 2003). Optimization models application in SMEs has been nominal and mainly concentrated in branches and subsidiaries of foreign multinational corporations (Fong, 1980; Cabraal, 1981; Caixeta-Filho, et al, 2002). Still there is a wide spread perception in SSA that optimization models can only be applied in well organized and bigger companies. However, we need to know that models and their results can be adjusted to suit a particular situation (Zimmermann, 1994, Ignizio and Tom, 1994). In fact, small firms can be more suitable for the application of optimization models as their production processes are simple and traceable and they produce few types of products. Unfortunately, this is not the case with the SMEs in the Sub-Saharan African (SSA) nations.

They have so far failed to benefit, as desired, from the use of at least basic optimization models to promoting their efficiency and effectiveness. They need to do a better job in order to be able to use optimization models for their strategic and operational activities (Bazaraa, and Bouzahr, 1981). SMEs have a strong representation particularly in SSA nations (Tesfayohannes, 1998). For example, in South Africa, SMEs account for more than 35% of all manufacturing firms (South African Institute Race Relations Report, 1999). They are the prime push factors of employment generation, innovation and sustainable industrial development. Therefore, successful application of optimization models in SMEs is regarded as an important contribution to the sustainable industrial development of SSA nations.

In this paper, I presented a simple resources optimization model called Production Plan Optimization (PPO). My intention is just to alert SMEs in SSA that they can also apply optimization models and through that to improve their efficiency and effectiveness in resources utilization. I would like to make clear that application of optimization models is intricate particularly in a developing economy. However, starting with the simplest model can contribute a lot in the efforts of achieving best unitization of resources. All concerned need to know that even the simplest model can help if it is adapted to the peculiar realities on the ground. On top of that special and general purpose computers are widely available in the SSA nations at this time. Therefore, SMEs should use optimization models in their vital operational activities like production planning and scheduling, etc.

METHODOLOGY OF APPLYING OPTIMIZATION MODELS IN PRODUCTION PLANNING

To apply optimization models successfully, we need to formulate a topological specification system that can help us to classify and group variables in our operational planning process (Horngren, Foster, Datar, and Teall, 2000; Chase, Jacobs, and Aquilano, 2004; Heizer, Jay and Render, Barry, 1999). While we can have a variety of production variables as inputs, let us start with the three major inputs in a production process as a starting point. These major inputs are: Available Machine Hours, Available Labor Hours and the Required Direct Materials. The objective is to minimize the direct production costs by optimizing the use of these vital inputs in a given production process (Salaheldin and Eid, 2007; Foulds, 1981; Gupta and Mohan, 1989). My intention here is just to show how SMEs can apply simple optimization model in order to enhance efficiency and effectiveness in their production process. I attempted to shape the model in the way to suite production system specifications.

THE TOPOLOGY OF SPECIFICATION PROCESS IN PRODUCTION PLANNING

In this section, I formulated a typological specification process that can identify the operational characteristics and systems of manufacturing firms and obtain knowledge about the following important features: The relationship between the production plan and the production process; the objectives and decision variants of production plan; the objective realities and peculiarities of the decision variables for which optimal result is searched; the necessary information for operational planning models; and the detailed data to be obtained from a solution of an optimization model. The typological specification process shown below is specifically for SMEs engaged in manufacturing activities with obviously limited production lines.

C. Fabrication (or formation) Process	C. Mixed Layout System			
D. Assembly Process				
E. Hybrid or Mixed Process				

Basic Forms of Production Process

A) Extraction Process indicates the process of raw and basic material extraction (depletion) from natural reserves. B) Conversion Process demonstrates the process of changing chemical contents of materials. For example, changing iron ore into metal sheets, or making ingredients into one combined output. (E.g. chemical processing plants). C) Fabrication (or Formation) Process refers to the process of transforming materials physically that is changing them into some specific forms as desired. For example, furniture plants, textiles, and many others. D) Assembly Process refers to fixing parts together to give them specific formation and function. Examples include assembling a fender to a car, assembling tires to a bicycle. E) Hybrid or Mixed Process referring to using more than one production process systems at the same time and in same floor.

Plant Layout System

Layout is the arrangement of production facilities on industrial premises. The three basic types of layout for basic production system are: A) Layout by Process (Functional layout): all operations of a similar nature are grouped together in the same department or production centre of the factory. For example, there may be separate areas for drilling operations, milling, grinding, and fitting. B) Layout by Product: Production facilities are arranged according to the needs of the product and in the same sequence as the operations necessary for manufacture. Layout by product is appropriate for the production of a small range of products in very large quantities (mass production). Production should be continuous. C) Mixed Layout System: Some industries use both the above mentioned layout systems simultaneously. In particular, larger firms that produce varieties of products may find it necessary to arrange their production facilities using both types of layout systems. This means that some of their process departments may be organized based on process layout system and the others based on a product layout system. There are other layout systems, but for small industries the above mentioned layouts systems are Suffice.

Production Process System

This refers to the firm's production process flow. There are four types of process flows: Job Shop, Batch, Assembly Line, and Continuous. However, they are more or less grouped into two major production process systems: A) Continuous Production System which is practical in mass production industries such as cement processing, brewery, refinery, etc. Once the production system is designed and implemented, it remains active for a long time. A change in production systems means investing a large capital outlay. The machines available are special purpose machines. B) Intermittent Production System is usually applied in manufacturing industries that produce a variety of products at a time, (or finite number of products in batches to fulfill a customer order). Printing press and woodwork are some of those industries using the system.

Technological Standard

Generally, the production process is largely dependent on human labor or hardware technologies such as automated machining, material handling and industrial robots. Therefore, the technological standard of the production process system can be broadly categorized as labor or capital intensive: A) Labor Intensive Production Process is usually used by small manufacturing industries that produce simple and mostly consumer goods. In this system, the use of expensive and special purpose machines is low. The role of human labor in the production process is dominant. B) Capital Intensive Production Process applies to manufacturing industries engaged in mass production activities and use modern, expensive and highly specialized as well as largely automated machines.

Cost Accounting System

The costing system of manufacturing industries is based on the type of production system used. Generally there are two basic costing systems: A) Job Order Costing System is the application of costs to specific jobs, which may be either a single physical unit or a few similar units (such as a dozen of chairs). Units are identified by individual codes or batches. Job order costing system is applicable in industries like construction, garment factories, furniture manufacturing, metal tools fabricating and printing. B) Process Costing System is used by firms manufacturing standard products for stock in a continuous flow, without reference to specific orders or lots. Emphasis is placed on production for a given period such as a day, a week or a month. Process costing system is applied in industries like flourmills, breweries, cement plants, chemical plants, sugar factories, paper factories, textile mills, food processing and others.

Based on the above typological specifications, we can characterize the operational activities' framework of a given manufacturing firm. For example, a plant can be characterized as: engaged in material conversion, (1B); arranged according to product layout system (2B); apply a continuous production system, (3A); use capital intensive production process, (5B); apply process costing system (5B).

The typological specification process is a prerequisite for determining the following basic structures of constraints: labor hours constraints based on occupational (or qualification groups) and structural units; material resource constraints based on material type and structural units; machine hours constraints based on types of machines and average operational capacity; minimum allowed production volume (level of demand); and the average standstill and waiting time in production process.

Model Establishment Process

Problem Analysis: We assume that the formulation of optimization model will be based on an annual production plan. We need to determine the major elements of production plan in order to identify and analyze production plan related problems in production planning process. For example, we could face problems during the process of: identification of the factors of production; determination of the objective function; determination of resources inputs used for production; and determination of the potential

constraints that are used in the application of optimization models. The most difficult job is to sort out: machines according to their models, types and operational capacity; materials according to their type and quality; and labor force according to qualification and occupation. In the process of problem analysis, we should be aware of the specific stages (or centers) of production process in which inspection or a test is performed. Idle periods such as set-up, repair or operators rest time, etc and others should be reduced to determine the net daily operational hours.

Modeling and Algorithming

The general formulation of optimization model for firms capable of producing more than one product is presented below. Let a plant produces product uj , where $j = 1, 2, \dots, n$. u_j is defined as the quantities of product j (decision variables). The constraints for our model are limited to the direct (core) inputs comprising the major costs of production: *Machine Hours*, *Labor Hours* and *Direct Materials*. Their optimal utilization has a considerable impact on the cost of each product. The maximum projected (estimated) sales during a given time duration is also regarded as a constraint. There are also many other constraints, but as a first attempt, I considered only those influential (direct) constraints mentioned above. The decision on constraints for optimization model related to production planning should be based on a specific manufacturing activity of a given firm. I formulated tabular formats for use in the process of data collection and determination of net available resources. I cannot show them here due to space limitation. Each firm can manipulate the proposed tabular formats they fit its specific operational structure.

Machine Hours: To determine net available machine hours, we should deduct all causes of machine idleness.

The mathematical presentation is:

$$m_{wj} \quad \begin{matrix} w = 1, 2, \dots, z \\ j = 1, 2, \dots, n \end{matrix}$$

m_{wj} is the necessary machine time in hours of w^{th} machine group (type) for the j^{th} product. Therefore:

$$\sum_{j=1}^n m_{wj} u_j \leq M_w \quad w = 1, 2, 3, \dots, z$$

M_w is the sum of the net available machine time for w^{th} machine group. The most important task is to collect the necessary data for the computation of the available operational machine time in hours. I designed and made ready formats for use in the data collection purpose.

Direct Material: Our second constraint is direct material. Materials, that are identified as major part of the finished products and may be traced to the finished products in economically feasible manner, are called direct materials. Examples of these are: sheet steel for metal industries, wood for furniture industries, cotton for textile, etc. Direct materials do not include indirect materials. Indirect materials are minor items and their tracing cost is most unviable.

The mathematical presentation is:

$$f_{ij} \quad i = 1, 2, \dots, r \text{ and } j = 1, 2, \dots, n$$

f_{ij} is the necessary quantity of i^{th} type of direct material for each product j . Therefore:

$$\sum_{j=1}^n f_{ij} u_j \leq F_i \quad i = 1, 2, \dots, r$$

F_i is the grand total of the available direct material resources of i^{th} type of material. I designed tables that are intended for data collection purpose.

Labor Time: The labor time used in production process is divided into direct and indirect. Direct labor is all labor that can be identified in an economically feasible manner with the production of finished goods. It is a variable part of the production cost. For example, the labor of machine operators and assemblers is recognized as direct. However, indirect labor is not generally traceable to specific products. We therefore consider the direct labor as our third constraint.

The mathematical presentation is:

$$x_{sj}, \quad \begin{matrix} s=1,2,\dots,t \\ J=1,2,\dots,n \end{matrix}$$

x_{sj} is the necessary direct labor hour(s) of s^{th} qualification (occupational) group to process a unit of j^{th} product.

$$\sum_{j=1}^n x_{sj} u_j \leq X_s \quad s=1,2,\dots,t$$

X_s is the grand total of the net available direct labor time in hours for the s^{th} Qualification group. I designed tables (not presented here due to space limitation) that can be used for data collection purpose. It is assumed that labor hours and machine hours depend on each other as a machine cannot run without an operator and vice versa.

The maximum level of production for a planned year d_j is determined based on the forecasted level of sales for that planned year. The minimum production level e_j reflects the *Economic Production Quantity* (EPQ). That is the minimum quantity a plant must produce in order to achieve a reasonable production cost leading to breakeven. If a plant produces lower than the EPQ, the result is higher production cost (due to higher proportion of fixed cost per unit), and this leads to unsustainable business survival.

Formulation of The Objective Function

Formulating practical objective function is a challenging task. As an initial attempt and for practical purpose, I selected the relevant objective function as *Maximization of a Contribution Margin*. A contribution margin is the result of *operational sales minus all variable production costs*. Fixed production costs are excluded because they do not vary with the number of units produced. A contribution margin is affected by both sales price and variable production costs. A higher sales price or a lower production cost maximize contribution margin or vice versa. The computation of a contribution margin is presented below:

Mathematically we define our objective function for each unit of j^{th} product as follows:

mk_j is the direct material cost per unit of j^{th} product; lk_j is direct labour cost per unit of j^{th} product; fk_j is factory overhead cost per unit of j^{th} product; ak_j is variable selling cost per unit of j^{th} product; bk_j is variable managerial cost per unit of j^{th} product.

Thus:

$$k_j = mk_j + lk_j + fk_j + ak_j + bk_j$$

k_j is the total variable cost per unit of j^{th} product; c_j is the contribution margin per unit of j^{th} product; p_j is the sales price per unit of j^{th} product.

Therefore:

$$c_j = p_j - k_j$$

Based on the above computation we formulate our production plan optimization model as:

$$(1-2) \quad \sum_{j=1}^n m_{wj} u_j \leq M_w \quad w = 1, 2, \dots, z$$

$$(1-1) \quad \max. \quad z = \sum_{j=1}^n c_j u_j$$

Subject to:

$$(1-4) \quad e_j \leq u_j \leq d_j \quad j = 1, 2, \dots, n$$

$$(1-3) \quad \sum_{j=1}^n f_{ij} u_j \leq F_i \quad i = 1, 2, \dots, r$$

The above formulated model contains only the three main direct inputs in a production process.

The Necessity Of A Post Optimality Analysis

$$(1-5) \quad \sum_{j=1}^n x_{sj} u_j \leq X_s \quad s = 1, 2, \dots, t$$

There are many factors that cause changes in coefficients of objective function and constraints. These parametric changes are usually interrelated. For example, some of the major parametric changes are: changes in the contribution margin per unit of j^{th} product (the coefficient of the objective function i.e., c_j); changes in the amount of operational machine hours of w machine types (groups) necessary to process a unit of product j (m_{wj}); changes in the quantity of i^{th} material type necessary to process a unit of product j (f_{ij}); changes in the amount of direct labour hours of s occupational group (or occupational qualifications) necessary to process a unit of product j (x_{sj}); changes in the total available operational machine time of w machine groups for a planned year (M_w); changes in the total available quantity of i^{th} material art for a planned year (F_i); changes in the total available direct labor hour of s^{th} occupational group (X_s); changes in the projected level of demand for a given planned year (d_j).

There are many other possible causes for change in the contribution margin. For example, increase or decrease of sales prices or increase or decrease of the elements of variable production costs affects the contribution margin. Sales prices are affected by many factors such as: competitiveness in market price, demand and supply condition, quality of finished goods and many others. In the same manner, if variable production costs decrease, it may be because of improvements in a production process, increased labor productivity, greater efficiency in material's utilization, and efficiency in machine usage or managerial effectiveness. For example, if the productivity of a machine operator improves the amount of direct labor norm necessary to process a unit of a product decreases (or vice versa), the same logic applies to direct material and machine hour usage rates. These changes directly affect the contribution margin (the objective function in our case). Based on the above analysis we conclude that the changes equally affect both coefficient of the objective function c_j and the coefficients of resources functions Σa_{ij} . That is: $c_j = \Sigma a_{ij}$.

The changes in the sum of available materials, operational machine and labor hours that are generally defined as b_i (the right-handed side constraints) affect the once formulated production plan optimization model significantly. There could be many possible reasons for periodical changes in b_i . For instance, changes in the production volume, changes in the kind of material utilization, etc.

All factors which affect the production plan directly should be seriously monitored. .

Application's Case- Asmara Sweater Factory

I tested the above formulated optimization model in a small factory in Eritrea (Africa): Asmara Sweater Factory. The factory has been producing two types of sweaters: heavy and light sweaters for cold and hot seasons respectively. These two types of sweaters are made up of three types of materials: Wool, Acrylic and Lana. The factory is a good example of the type of small industries existing in the SSA nations. I obtained the necessary data for the application of optimization model from the factory's documents in 2003. The factory has three processing centers: Spinning, Weaving, and Finishing and Packing operating in three shift system. Heavy sweater and light sweater are identified u_1 and u_2 respectively. One unit of both products is a dozen of sweaters of different sizes packed together. The basic resources used in production process are operational machine hours, operational direct labor hours and direct material (Wool, Acrylic and Lana). The factory applied intermittent production system.

Therefore, operational machines which perform similar processes are grouped together and located in different process centers. Operational workers are also aggregately grouped and assigned into the three processing centers in order to operate the machines available in each processing centre. The factory operated in three shifts per day except in processing center three (Finishing and Packaging) which is two and half shifts as the condition of work allows saving half shift in labor costs. This means machines in processing center three will be idle for half shift time. I averaged 1500 available machine hours per machine for each shift during a planned operational year. I assumed that more than one operator can be assigned to a single machine and operators are trained to be multi-skilled and they can be assigned to any machine in the three processing centers. The nature of the production process is also convenient for job rotation. The derived optimal solution is: 7500 units of product 1; 0 units for product 2; total contribution margin is \$450,000. According to the above analysis, the bottleneck is the available operational labor hours in machine group three. Its capacity is completely utilized. However, the others have still unused (idle) resources. To improve the optimal solution and to utilize the idle resources, the company should hire additional operators. The maximum operational labor hours we can add is only 18,000. Therefore, we have to hire 12 new operators with a capacity of 1500 hours each per year. But as we have said earlier, the total cost of hiring additional labor force should be compared with the incremental value of our contribution margin.

WHAT SHOULD BE DONE TO ENHANCE THE IMPLEMENTATION

First of all, we need to identify problems hindering SMEs in SSA nations applying very helpful optimization models in general. This means that we need to evaluation internal capacity of SMEs and their environment. It is not easy in many SSA nations to complement practical application. There are many social, economic, cultural, organizational, organizational,..., etc problems encountering SMEs in the SSA nations. To improve the situation and foster the ability of SMEs to successfully use optimization models, all stakeholder need to take series of actions. In line with these efforts, I presented the following general recommendations:

- Each firm must improve its organizational structures and managerial capability in order to create a favorable climate for the application of optimization models.
- Firms should establish a system of keeping adequate and accurate data that are necessary for the application of relevant optimization models
- Decision problems should be thoroughly analyzed and formulated. The determination and selection process of a suitable objective function should reflect the peculiar company conditions and characteristics.
- The application of optimization models is unthinkable without using computers. Therefore, SMEs should acquire and use suitable computers and relevant software programs.

- Models should be frequently updated, as we are living in a very dynamic and competitive world.
- Emphasis should be given to training and upgrading of the skills of local qualified professionals in decision sciences in order to be able to help firms in their endeavors of applying optimization models.
- Firms should perform the necessary cooperation, experience exchange and joint research with different local and foreign firms and academic institutions.
- Applications of optimization models should be gradually popularized among the SMEs manager/owners and other senior management personnel via seminars, lectures, short-term courses and by other means of dissemination
- Colleges and universities in SSA nations should design and offer quantitative oriented courses to their students majoring in business and economics
- Governments should help SMEs to import tax free computers and software packages that are desired for their optimization models application

CONCLUSION

Optimization models have demonstrated their invaluable contribution towards economic efficiency and sustainable industrial development in many countries. Scarce resources need to be frugally (rather optimally) utilized and this is the means of survival and prosperity especially for SSA nations. SMEs are the foundations of industrialization and their further development depends on proper management. The optimization model formulated in this paper is basic in its mathematical background and simple in its applications approaches. There are many “If” and “Then” situations as the main purpose of my paper is to serve as springboard for further research in practical application of optimization models to industrial management decisions in SSA nations. The paper has contained a foundational framework which is open for further improvement on how optimization models can be appropriately applied to enhance production efficiency and effectiveness of SMEs in SSA nations.

The challenge ahead is to integrate the theoretical knowledge with practice which is more difficult in developing economies. Failure to adapt optimization models to a particular situation and using inaccurate operational data can have detrimental impacts on applications of optimization models (Ashayeri and Selen, 2003). This paper has limitations and many questions have not been answered. They are subject to further research and investigation. Firstly, other resource constraints that may not be easily traceable are deprived from consideration in order to reduce the complication of model application. Secondly, future events are always uncertain and can trigger the unreliability of forecasted demands for specific period. Firms should take the necessary care to ensure that their forecasted demands are reasonable and realistic. Thirdly, the complexity of estimating labor hours, machine hours and other resources as aggregated constraints is an intricate task. It demands that firms should maintain a prudent and efficient operational activities record keeping and cost accounting systems. It was not easy to obtain the desired operational data from the Asmara Sweater Factory. I am aware that the application of optimization models is subject to trial and error. But, why not, even the simplest model is helpful, and serves to disprove the unwarranted perception of non-applicability of mathematical models in developing economies.

In fact, there is a wide spread phobia among SMEs’ managers for applying mathematical models. Most of them believe that applying mathematical models is like spending time and resources on abstract theories (Gilbert, 2003, Ashayeri and Selen, 2003). To avoid this misperception, models should be presented in the way SMEs’ owner/managers can understand and appreciate their application. .

ABSTRACT

This paper discusses factors affecting mining investment in Zimbabwe. It also estimates a flexible accelerator model of mining investment using data from 1976 to 1997. The paper argues that direct influence of interest rate on mining investment in Zimbabwe is limited by the non-existence of adequate local credit. However, interest rate has affected investment indirectly through its effect on the cost of working capital and therefore, on the rate of return. Cash flow problems, which have recently been linked to the activities of the Central Bank, have constrained internal sources of investment finance. Political risk and uncertainty, mainly related to the outstanding finalization of mining and empowerment legislations and perceptions emanating from the recent land reform programme, have resulted in the postponement of large-scale investments. The flexible accelerator model results show that mining investment is mainly driven by current output. There is a negative relationship between investment and the lagged investment variable, which may be linked to the generally small-scale nature of mining projects in Zimbabwe. The paper recommends development of a comprehensive database on mining (indicative planning) and finalization of pertinent legislations in order to reduce risks and uncertainties. Direct measures to promote increased current production are also recommended.

KEYWORDS: Mining investment, flexible accelerator model, interest rate, risk

INTRODUCTION

Zimbabwe is rich in a wide variety of minerals among other natural resources. Currently there are more than forty different types of minerals mined in the country. Major among them, in terms of production value, are gold, asbestos, nickel, coal, copper, chrome, tin, iron, silver and cobalt (Central Statistical Office, various issues). The Ministry of Mines and Mining Development (2010) estimates that resources of metallurgical quality chrome in Zimbabwe as a percentage of world resources of chrome are 80%. It is also indicated that the country hosts some of the most productive greenstone belts in the world in terms of gold. Platinum group metal resources in the country are ranked second largest in the world. Black granite is abundant (“ubiquitous”) in the north-eastern part of the country. Besides the existence of kimberlites, the country boasts of extensive deposits of alluvial/placer diamonds in Chiadzwa, which are estimated to have a potential production of 25% of the world’s diamond output. Exploration for coal bed methane gas has recently been carried out and there are huge estimates of reserves being given going to billions of cubic metres of gas. But detailed explorations to prove these reserves are yet to be done.

Hawkins (2009) estimates that from 1968 to 2009 the ratio of investment to gross-output in the mining sector was between 10 and 12 percent. Vigorous mining industry expansion was recorded for 1968-1971 period, the period during which nickel and ferrochrome experienced expansion. During this period investment averaged 21.5% of gross output. From 1973-1996 mining investment averaged 25 percent of output (at current prices) with another period of vigorous expansion in the mid 1990s. During the period 1983-1993 there was negative net investment and a backlog in replacement investment. After 1997, except in the platinum and diamond sectors, exploration and new capacity investments have been minimal. According to the President of the Chamber of Mines at the Chamber of Mines Annual Congress in 2007, since 2003 no new (major) exploration licences had been issued. A lot of the equipment being used now has aged or become obsolete.

PROBLEM STATEMENT, RESEARCH OBJECTIVES AND SIGNIFICANCE OF THE STUDY

While mining investment is a very topical subject in various mining fora in Zimbabwe, a proper modelling of the issue remains. In addition, it is very important to look at the question in the current economic context in Zimbabwe, which is defined by a recent decade of recession in most economic sectors and a current state of uncertainty as the economy slowly gets out of the recession.

This study therefore, seeks to do two things. Firstly, it seeks to briefly discuss several factors affecting mining investment in Zimbabwe, including those suggested by Keynes' theory of investment and those suggested by the unique characteristics of the mining sector. This part of the study is, therefore, a rapid appraisal of the investment environment in Zimbabwe, which seeks to isolate those factors that have had significant impact on mining investment recently. Secondly, the study seeks to estimate a Zimbabwe mining sector flexible accelerator model of investment and test for the significance of the variables included. In this estimation, the study makes use of data from 1976 to 1997 because after that, data was not reliable as national data collection offices faced financial difficulties.

The importance of this study is in that, if factors significantly affecting mining investment decisions in Zimbabwe were known, policy would seek to influence these factors so that investment can be expanded. Expansion in mining investment is important in that the only way to convert mineral deposits from *sleeping* resources to income (and presumably development) for the betterment of an economy is to invest in mining capital. Net investment in any sector of the economy, mining included, makes future consumption possible and makes the economy grow. Following the perspective of the New Growth Theory that technology is embodied in new capital, investment, therefore, combines two important growths - capital growth and technical progress. This is especially the case in the Zimbabwe mining sector where both investment and technical progress significantly derive from the foreign sector. Some of government macroeconomic policy measures work through investment, hence a study of investment behaviour, whether sectoral or general, is important in designing macroeconomic policy.

LITERATURE REVIEW

Mining investment is business fixed investment. Business fixed investment is defined as “...*spending devoted to increasing or maintaining the stock of capital*. The stock of capital consists of the factories, machines, offices, and other durable products used in the process of production” (Dornbusch & Fischer, 1981, p.18). Poindexter (1976, p.143) points out that investment is the purchase only of new assets, not those already existing (second hand) because the latter case represents a disinvestment by the one who sells even though the one who buys regards it as investment. Discussed in the following two sections are two theories of investment - Keynes' theory (Based on Pentecost, 2000; National Economic Planning Commission, 1996; and Shapiro, 1974) and the accelerator model (Based on Gujarati, 1988; and Dzawanda, 1994).

Keynes' Theory of Investment

Pentecost (2000, p.119) views the value of a piece of capital equipment as the net present value of income that will be derived from the use of that equipment. That is, value (V), using the formulation in National Economic Planning Commission (1996), is given by:

$$NPV = \sum_{t=m+1}^n \frac{R_t}{(1+i)^t} - \sum_{t=0}^m \frac{I_t}{(1+i)^t} \quad (1)$$

where m = the whole investment period (that is, the time it takes to set up the investment equipment); n = the useful life of the piece of equipment; i = discount rate; R_t = net receipts from use of machine in year t ; and I_t = investment in year t .

The rate of discount which ensures that NPV is equal to zero is of great interest and it is called the *internal rate of return (IRR)*. It is what Keynes calls the *marginal efficiency of capital (MEC)* and is actually the expected rate of return from a capital asset. The market interest rate is a measure of the cost of loanable funds hence may be used to discount future money to present value because it represents the time value of money. A lower market interest rate will imply a higher NPV than a higher rate of interest. A comparison of the MEC to the current market rate of interest, r , therefore, indicates whether or not an investment may be profitable. It would be profitable if $r < \text{MEC}$ and vice versa. Thus, once MEC is given, r determines whether or not the capital good will be purchased though it does not determine the MEC of that good (A useful reference on this is Shapiro, 1974).

Therefore, *ceteris paribus*, a change in either interest rate or MEC affects net investment (Shapiro, 1974). When interest rate falls more projects will be undertaken (as new additional projects with lower MECs are taken on board) and vice versa. When MEC falls less projects will be undertaken at the same rate of interest and vice versa. Anything that makes the businessman expect more income flow from use of a capital good, assuming the capital good does not change its price, will raise its MEC. Also a fall in the price of the capital good (by reducing costs hence increasing NPV) with expected income unchanged will raise its MEC.

The Keynesian investment function can then be summarised by:

$$I = \beta_0 - \beta_1 i \quad (2)$$

where β_0 captures exogenous shifts in business expectations (Pentecost, 2000, p.124), which are then reflected in the MEC. Thus, both MEC and interest rate affect investment.

The Accelerator Theory of Investment

The flexible accelerator model assumes the existence of an *equilibrium, optimal, desired, or long-run* stock of capital required to produce a given output for a given technology, rate of interest, and so forth (Gujarati 1988, p.519).

Assuming that:

$$K_t^* = \beta_1 Q_t \quad (3)$$

where K_t^* is desired mining capital stock in period t , and Q_t is current mining output in period t . The capital adjustment process is defined by the following equation (Pentecost, 2000, p.124; Gujarati, 1988; and Dzawanda, 1994):

$$K_t - K_{t-1} = \delta (K_t^* - K_{t-1}) \quad (4)$$

where δ , being $0 < \delta \leq 1$, is the coefficient of adjustment.

$$K_t = \delta K_t^* + (1 - \delta) K_{t-1} \quad (5)$$

Substituting (3) into (5) and simplifying gives:

$$K_t = \delta\beta_1 Q_t + (1 - \delta)K_{t-1} \quad (6)$$

The net investment function as strictly based on relationship (4) becomes:

$$K_t - K_{t-1} = I_t^n = \delta\beta_1 Q_t - \delta K_{t-1} \quad (7)$$

If we assume that replacement investment in period t is a positive proportion, α , of previous period's level of capital, gross investment is given by (See Dzawanda, 1994):

$$I_t^g = K_t - K_{t-1} + \alpha K_{t-1} \quad (8)$$

$$I_t^g = K_t - (1 - \alpha)K_{t-1} \quad (9)$$

Substituting (7) into (8):

$$I_t^g = \delta\beta_1 Q_t - \delta K_{t-1} + \alpha K_{t-1}$$

$$I_t^g = \delta\beta_1 Q_t + (\alpha - \delta)K_{t-1} \quad (10)$$

Lagging (10) once and multiplying the result by $(1 - \alpha)$ we get:

$$I_{t-1}^g = \delta\beta_1 Q_{t-1} + (\alpha - \delta)K_{t-2}$$

$$(1 - \alpha)I_{t-1}^g = (1 - \alpha)\delta\beta_1 Q_{t-1} + (1 - \alpha)(\alpha - \delta)K_{t-2} \quad (11)$$

Subtracting (11) from (10) gives:

$$I_t^g - (1 - \alpha)I_{t-1}^g = \delta\beta_1 Q_t - \delta\beta_1(1 - \alpha)Q_{t-1} + (\alpha - \delta)K_{t-1} - (1 - \alpha)(\alpha - \delta)K_{t-2}$$

But from (9), $I_{t-1}^g = K_{t-1} - (1 - \alpha)K_{t-2}$. Therefore:

$$I_t^g - (1 - \alpha)I_{t-1}^g = \delta\beta_1 Q_t - \delta\beta_1(1 - \alpha)Q_{t-1} + (\alpha - \delta)I_{t-1}^g$$

$$I_t^g = \delta\beta_1 Q_t - \delta\beta_1(1 - \alpha)Q_{t-1} + \alpha I_{t-1}^g - \delta I_{t-1}^g + I_{t-1}^g - \alpha I_{t-1}^g$$

$$I_t^g = \delta\beta_1 Q_t - \delta\beta_1(1 - \alpha)Q_{t-1} + (1 - \delta)I_{t-1}^g \quad (12)$$

Adding a constant β_0 for autonomous investment and an error term u_t , gross investment is finally specified as a function of current output, lagged output and lagged investment:

$$I_t^g = I_t^g(Q_t, Q_{t-1}, I_{t-1}^g) = \beta_0 + \delta\beta_1 Q_t - \delta\beta_1(1-\alpha)Q_{t-1} + (1-\delta)I_{t-1}^g + u_t \quad (13)$$

Model (13) can then be estimated. The coefficients of current output, lagged output and lagged investment can be tested for significance. Note that from this estimation we can also find the values of the coefficient of adjustment (δ) and the depreciation rate (α).

The Unique Characteristics Of Mining Investment Environment

Mining is characterised by a number of unique conditions, and these create an investment environment that is peculiar from other industrial sectors.

Mining is characterized by extreme capital intensity and long lead times (time between discovery and actual production). Another characteristic closely related to capital intensity and long lead times is the long payback period, which may differ from country to country. These features result in stability of regulations and security of titles being critical matters to investors in this sector. Security of titles is made more crucial by the fact that mining investment is irreversible, meaning that once the mine closes the capital invested is not recoverable (This paragraph is based on Gentry & O'Neil, 1984, p.5; and UNCTAD 2010, p.39).

Mining is a high-risk business. Risk is defined as: "A context in which an event occurs with some probability (capitalised) or where the size of the event has a probability distribution (last two words capitalised)...Risk should not, however, be confused with probability since it is an amalgam of both this probability and the size of the event" (Pearce, 1986, p.373). The most important types of risks in mining are market risks (such as price fluctuation, changes in future demand, and changes in foreign exchange rates) and political risks, which are risks associated with unforeseen government actions including nationalization and changes in environmental regulations, taxation, import duties, et cetera (Gentry & O'Neil, 1984; and Gocht et al, 1988).

A concept closely related to that of risk but conceptually distinct is uncertainty. Pearce (1986, p.431) defines uncertainty as: "A situation in which the likelihood of an event occurring is not known at all...If the event in question is an investment in a project...the conceivable returns will be known but their probability of occurrence will not be known". Driver & Moreton (1992) argue that uncertainty may engender a sustained caution, or postponement of investment plans, or reduction in payback period used in investment profitability criteria. They also contend that uncertainty is especially associated with economic structural change, a process that tends to create new opportunities, making uncertainty most adverse.

Minerals are non-renewable and this gives rise to critical issues in the use of these resources (Gentry & O'Neil, 1984, p.6). The 'natural heritage theory' argues that non-renewable mineral deposits are for the benefit of all people, and thus, the whole society should benefit from mineral exploitation. This, in practice results in heavy taxes on private mining companies. Gradual wearing of mineral resources has also been used to justify minerals depletion allowance in the income tax code. All mines have finite lives, which means that adequate return should have been received by the time the resource is depleted, and also new deposits must be found and developed. This also means that at some point there will be mine closure. This has very significant repercussions – ghost towns, severe dislocations, unemployment, bankruptcy of local businesses, reduction in local population, and fall in real estate values. Many political leaders are insisting that the mining companies should be accountable for these effects.

A Summary of the Implications of the Literature Review

From the foregoing discussion, the following can be identified as possible factors that influence mining investment: project internal rates of return, market interest rate, risks, uncertainty, a fiscal and policy regime emanating from the non-renewable nature of minerals, current level of mineral output, previous year's output, and lagged mining investment. Poindexter (1976) also suggests credit availability and cash flow. The next two sections look at the significance of these factors in the Zimbabwe mining sector.

DETERMINANTS OF MINING INVESTMENT IN ZIMBABWE: DISCUSSION

Credit Availability And Cash Flow Problems

The Chamber of Mines (2010) identifies two sources of cash flow problems for the mining sector in Zimbabwe. The first is stiff surrender requirements. For the gold sector mines were required to surrender 100% of their proceeds since 1997 (up to 2009 at the advent of the multi-currency regime) by being forced to sell their produce to the Reserve Bank of Zimbabwe (RBZ) in return for Zimbabwe Dollars at the rate of Z\$55/US\$1. In the black market, however, exchange rates (directly quoted) were several thousands times higher. Secondly, the RBZ owed mining companies substantial amounts of money in foreign currency. This debt emanated either from the unauthorized use by the Bank of funds in private accounts of mines to fund critical areas of need during the crisis, or unpaid mineral deliveries. Later the RBZ converted this debt into gold bonds which could not be redeemed unless they were steeply discounted because the market had lost confidence in the bank. With respect to credit, this was and is simply not available due to low savings in the domestic market. For example, in December 2009, total deposits in the local banking sector amounted to US\$1.3 billion, an insignificant figure considering the country's requirements. With such restrained cash flows and credit it has been very difficult for mines to meet operational requirements let alone to achieve net investments. This actually led to many mines closing down and most placed on care-and-maintenance.

Interest Rates

There have not been any significant lines of credit to the mining sector for fixed capital investment from the local credit market. Studies have also concluded that a negative relationship between investment and interest cannot be supported in Zimbabwe (Mlambo, 2010; and Dzawanda, 1994), while others which have obtained results consistent with classical theory have found them to be insignificant (Dailami & Walton, 1989). This is also true of mining investment. However, the local banking sector is sometimes an important source of working capital. In this case, interest rate becomes an important factor that affects the operation of mines hence affects the general business outlook. Interest rates (on borrowing) are more than 30% per annum currently, with the multi-currency regime (Chamber of Mines, 2010).

Political Risk And Uncertainty

Political risk is the single most significant damaging factor on mining investment in Zimbabwe. This is compounded by uncertainty with respect to property rights especially with the recent land reform programme that sought to effect redistribution of farmland to the majority of Zimbabweans. Some of the former farm owners are still to be compensated and uncertainties are high. There are also concerns of the rule of law emanating from past cases whereby court orders were disregarded, and generally, from the unending court disputes over farmland (Based on Chamber of Mines, 2010).

The Mines and Minerals Act is in the process of being amended. Originally, the amendment sought to transfer 51% of the stake in the mining sector to the indigenous people (meaning basically black

Zimbabweans), 26% of which was to be on a non-contributory basis, that is, free-carried shares. The bill, in its original form, faced stiff resistance from the mining industry, and was withdrawn for further review. This bill has taken long to be finalized, and during this process, many investors have been sitting on the fence. There is also the Indigenization and Empowerment Bill, which has been on the cards for quite some time. This looks at all the sectors of the economy, including mining. It is also still to be finalized. Unfortunately, the assessment of policy by investors is not only done through analysis of official administrative and regulatory systems, but also through political speeches. There has been great inconsistency regarding the Mines and Minerals Act amendments and the Empowerment Bill, with important politicians sometimes indicating 100% local shareholding, some zero percent and some the more realistic percentages in between. Politicians and technocrats have not always said the same thing. Uncertainty on policy stability has, therefore, significantly been part of the environment recently.

The question of political regime stability (see definition in Otto, 1992) has also been a significant factor affecting mining investment in Zimbabwe for the past four or so years. The country has been in the mode of a '50-50' anticipated government change, and recent elections (2007 and 2008) have failed to produce a clear presidential winner. The resultant temporary inclusive government (which includes the two main political parties) has only served to perpetuate perceptions of uncertainty regarding regime stability. If the ruling party were to change there are questions regarding whether the new regime would respect bilateral mining agreements that were made by the previous regime. However, on a positive note the fundamental system of government (see definition in Otto, 1992) has been stable in Zimbabwe for a long time. Zimbabwe has always held democratic elections every 5 years since independence in 1980, and most of these have been successful by international standards. Therefore, long-term national stability has positively affected the mining investment environment hence investment.

Risk profile has also been compounded by large foreign debt arrears (Chamber of Mines, 2010), which have meant that Zimbabwe could not access critical support from international creditors like IMF and the World Bank.

Project Internal Rate Of Return And Adverse Operational Environment

Until recently, a number of factors have affected the internal rate of return adversely, at a time when the rate of interest was rising. Lack of foreign currency especially for non-exporting mines such as in coal, iron ore, limestone, magnesite, and phosphates severely restricted their capacity to import new investment capital. Before the multi-currency regime, companies have had to apply for foreign currency at the RBZ and most of the times would not get it. Rising cost of imported spares due to the high parallel market exchange rates and general domestic inflation caused an escalation of operating costs, including rises in wage bill. The National Railways of Zimbabwe failed and still fails to adequately meet the needs of mining due to old equipment. Electricity tariffs rose and continue to rise steeply while at the same time power outages have become a frequent phenomenon. Power outages have been so significant that mines had to buy generators, which, apparently, cannot fully meet the power needs of the mines. The recent economic difficulties in the country have also resulted in the flight of skilled labor in all categories, including geologists, engineers, technicians and managers (This paragraph is based on Chamber of Mines, 2010; Roussos, 1988; Mining in Zimbabwe, 2002/2003; and Hawkins, 2009)

Fiscal and Policy Regime

The procedures for acquiring mining rights, the types of rights that can be acquired, with the specific details of applicant requirements, minerals applicable, length of tenure and fees are clearly laid out in Ministry of Mines and Mining Development documents such as Ministry of Mines and Mining Development (2010) and the Mines and Minerals Act (Government of Zimbabwe, 1996). In the same documents are laid out clearly the guidelines on mining development, mining, termination of mining,

arbitration of disputes, *et cetera*. This clarity has been a significant promotional tool for investment since it has reduced certain uncertainties regarding what is expected of the potential investors.

There is a significant scope for determining tax obligations in advance of investment because of the availability of such information and its long-term nature. Among some of the fiscal incentives that have significantly promoted mining investment are: (a) the right to market directly subject to reporting requirements to the Minerals Marketing Corporation of Zimbabwe; (b) import duty exemption on capital goods imported for purposes of mining in the first five years; (c) tax deductibility at 100% of all capital expenditure; and (d) the right to have offshore accounts for major mining projects (Government of Zimbabwe).

RESULTS FROM ESTIMATION OF A FLEXIBLE ACCELERATOR MODEL OF ZIMBABWE MINING INVESTMENT

This study estimates model (13), reproduced below, using the data for Zimbabwe Mining sector from 1976 to 1997 (Table 1). Data from 1998 to 2009 could not be used because they are either not available or unreliable. The data were obtained from the Reserve Bank of Zimbabwe (1998) and Central Statistical Office (2001).

Table 1: Mining Output, Lagged Mining Output and Mining Investment (All figures in Z\$million)

Year	Current Mining Output, Q_t	Lagged Mining Output, Q_{t-1}	Mining Investment, I_t
1976	230.500	177.800	60.00
1977	237.500	230.500	66.00
1978	252.200	237.500	59.00
1979	314.800	252.200	83.00
1980	414.760	314.800	83.00
1981	393.524	414.760	133.00
1982	383.044	393.524	94.00
1983	470.454	383.044	86.00
1984	546.467	470.454	81.00
1985	629.463	546.467	35.00
1986	699.384	629.463	57.00
1987	815.553	699.384	123.00
1988	985.692	815.553	200.00
1989	1,143.731	985.692	144.00
1990	1,345.595	1,143.731	166.00
1991	1,862.759	1,345.595	273.00
1992	2,484.586	1,862.759	512.00
1993	3,085.907	2,484.586	518.00
1994	4,326.700	3,085.907	785.00
1995	5,412.179	4,326.700	2,000.00
1996	6,109.843	5,412.179	2,370.00
1997	6,630.000	6,109.843	1,552.00

This table shows a time series of the values of mining output (current and lagged) and that of mining investment.

$$I_t^g = I_t^g(Q_t, Q_{t-1}, I_{t-1}^g) = \beta_0 + \delta\beta_1 Q_t - \delta\beta_1(1-\alpha)Q_{t-1} + (1-\delta)I_{t-1}^g + u_t \quad (13)$$

The above model is both an autoregressive model and a distributed lag model. To take care of autoregressiveness we use the instrumental variable technique, and the *ad hoc method* (sequential

regression) is used to deal with the problem of distributed lags. First, we regress gross mining investment against mining sector current and lagged outputs, from which we get estimates of investment. These estimates are lagged to get an instrumental variable for the lagged investment variable. Having taken care of the autoregressiveness, models (14) and (15) represent sequential Ordinary Least Squares regressions.

Model without lagged output variable

$$\begin{aligned}
 I_t^g &= -131 + 0.3403Q_t - 0.1271I_{t-1}^g, & R^2 &= 0.88 \\
 (98.8624) & (0.1559) & (0.6128), & df = 18 \\
 t &= (-1.327) & (2.183) & (-0.207), & F_{2,18} &= 63.63
 \end{aligned} \tag{14}$$

Model with lagged output variable

$$\begin{aligned}
 I_t^g &= -618 - 0.5138Q_t + 2.5866Q_{t-1} - 5.5133I_{t-1}^g, & R^2 &= 0.95 \\
 (114.8419) & (0.1953) & (0.5065) & (1.1267), & df &= 17 \\
 t &= (-5.385) & (-2.631) & (5.107) & (-4.893), & F_{3,17} &= 110.22
 \end{aligned} \tag{15}$$

According to the *ad hoc method* of estimating a distributed lag model, we begin with current output and then regress with lagged output included. In this sequential regression, if the coefficient of any lag of the concerned variable changes sign and/ or the coefficient becomes insignificant, one takes the last stable result. Note that since the variable Q is the one being lagged we may view Q_t as being with lag zero. We note in the above regressions that in (15) the coefficient of Q_t changes sign which makes (15) unstable. A further analysis of (15) will show that $\delta > 1$ and that $\beta < 0$, since they are respectively computed from the results as 6.5 and -0.08. The results would also imply a negative rate of depreciation. These values are meaningless since they imply that in any year miners' actual capital is 6 times more than they would desire in the long run and that the proportion of desired capital to output is negative. The qualitative results in (15) do not change even after correcting the regression for autocorrelation. For these reasons model (15) is rejected as unsuitable.

From (14):

$$\beta_0 = -131, \quad \delta\beta_1 = 0.3403, \quad 1 - \delta = -0.1271$$

Therefore, $\delta = 1.1271$ (this is the coefficient of adjustment, which we may equate to 1 since -0.1271 is not significantly different from zero), and $\beta_1 = 0.302$ (which is the proportion of desired capital to output). The value of the proportion of desired capital to output indicates that when output increases by 100% (doubles) desired capital stock increases by 30%. When we combine this result with that on coefficient of adjustment the result is that actual capital must also increase by about 30% (approximately equal to 34%).

Autonomous Investment

Model (14) shows that autonomous investment is negative at -Z\$131 million. This coefficient is, however, insignificant at 0.05 with a computed t value of -1.327 against a critical t value of -2.101. This means that autonomous investment is statistically equal to zero. This indicates that when there is no production in the current year and has been no investment in the previous year, there will be zero investment this year. However, considering the negative sign, this result means that when mines are not

producing and have not invested in the previous year, there will be disinvestment in the current year. This indicates a move towards liquidation. For some mines in Zimbabwe, we have had consecutive years of non-production and non-investment and many have actually degraded beyond care-and-maintenance to liquidation or just closing down, suffering natural depreciation of capital.

Current Output

The results also show that investment in the current period is positively affected by current output. The positive coefficient is significant at 0.05 level since t calculated ($= 2.183$) $>$ critical t ($= 2.101$). The sign of the coefficient of current output is consistent with theoretical expectations, that is, an increase in current output would cause an increase in investment. When mining output increases by Z\$1 million current investment increases by Z\$0.34 million.

Lagged Dependent Variable

The coefficient of the lagged dependent is negative and insignificant at 0.05. The following possibilities may be drawn from the negative sign: (a) this result may indicate that capital expansion is discrete – which may reflect the attitude of miners to try to take advantage of short-term or once-off investment incentives, for example, investment tax credits. Once the credits are no longer there the investment drive stops or falls; and (b) the result also seems to reflect the small-scale nature of mining in Zimbabwe, which, therefore, may shorten lead-time to one year for a project. The mining industry in Zimbabwe is characteristically small-scale (especially the gold sector, which is the main contributor to mining output value), and the view of most mines is short-term. Few miners are prepared to undertake new projects or expansion projects that take more than one year of waiting before they come into operation. Thus, when investment is undertaken this year, it may mean no investment for some years to come in the particular project or by that particular miner.

Whole Model

The explanatory power of the model is high at 88%, which means 88% of the variations in investment are explained by changes in current output and previous year's investment. The model as a whole is significant since computed F ($=63.63$) $>$ critical F ($=3.55$).

CONCLUSIONS AND POLICY RECOMMENDATIONS BASED ON THE MODEL AND THE FOREGOING DISCUSSION

The paper has shown that the most significant factor that drives investment is current output. A negative relationship between successive investment levels is also shown to exist, and it has been argued that possible factors to explain this include the discrete or once-off nature of investment, and the small-scale nature of mines in Zimbabwe. The influence of interest rate is insignificant in Zimbabwe because of the non-existence of local credit. However, interest rate has affected the cost of working capital hence general business outlook and the marginal efficiency of capital. Cash flow problems have also limited internal sources of funds for investment. These cash flow problems were recently linked to the activities of the Reserve Bank of Zimbabwe. Political risk and uncertainty have significantly held back big investments, and created a series of short-term/small investments. Risk is related to the outstanding finalization of the Mines and Minerals Act and the Empowerment Bill, as well as the recent land reform programme which has affected (rightly or wrongly) the perception of foreign investors on security of private property rights. Rates of return have been affected by various operational constraints and problems including lack of foreign exchange, parallel markets for foreign exchange, general domestic inflation, dilapidation of transport infrastructure, rise in energy costs and loss of skills to other countries.

Several policy recommendations emanate from the above conclusions. There is need to work to reduce all risks and uncertainties in the mining sector. This can be done through provision of market information, including the development of a comprehensive database on mining, mineral processing, geology, mineral economics and general economic environment in Zimbabwe (indicative planning). Finalization of laws on mining and empowerment, and improvement in respect of private property rights among citizens would also significantly reduce perceptions of risk and uncertainty. There is need to espouse macroeconomic policies that further stabilize the economy (stabilization policies) (On indicative planning and stabilization policy refer to Driver & Moreton, 1992, pp.157-158), and also to relook at the fiscal regime that impacts upon the mining sector in order to have a long-term rather than a short-term view (that is, make long term investment incentives). The mining sector should also be prioritized in the allocation of foreign currency. The Government also needs to directly promote current production through enhancing mining sector services such as geosurveys, analytical services (for export or exploration), *et cetera*.

EFFICIENCY AND PRODUCTIVITY OF INDIAN LIFE INSURANCE INDUSTRY AFTER DEREGULATION

Kalyan Chakraborty, Emporia State University, USA
Partha Pratim Sengupta, National Institute of Technology, India
Anirban Dutta, NSHM Business School, India

ABSTRACT

This paper investigates technical efficiency and productivity growth in Indian life insurance industry in the deregulation era. The empirical study uses DEA method and Malmquist productivity index to measure and decompose technical efficiency and productivity growth, respectively. The results suggest the growth in overall productivity is mainly attributed to improvement in efficiency. Higher pure technical efficiency and lower scale efficiency indicate the insurance firms generally, moved away from optimal scale over the study period. Finally, the truncated regression exploring the main drivers of efficiency in the long run found claims ratio, distribution ratio, and size share effect pure technical efficiency positively and firms that had both life and non-life businesses are more efficient than firms with life insurance business.

INTRODUCTION

With over a billion people, India is fast becoming a global economic power. India's rapid rate of economic growth over the past decade has been one of the most significant developments in the global economy. This growth has its roots in the advent of economic liberalization in the early decade of ninety, which has allowed India to exploit its economic potential and raise the population's living standard. With a relatively youthful population, India will become one of the potentially largest insurance markets in the future. According to a study the demand for insurance in India would accelerate after 2013 when per capita income would grow from \$600 (2004) to \$1000 (2013) (Sinha, 2004). As a part of the general opening up of the economy in 1993, Government appointed The Malhotra Committee to examine the structure of the insurance industry and the committee recommended that private companies should be allowed to operate. It took six years to implement the recommendations. The Indian Parliament allowed private sector into insurance business in 2000 after passing the Insurance Regulatory and Development Authority (IRDA) Bill.

The impact of deregulation is reflected by the fact that there were 22 registered insurers in India in 2000-01 (11 Life, 10 Non-life, 1-Reinsurer) which increased to 42 firms in 2009 (22 Life, 21-Non-life, 1-Reinsurer). However, in terms of insurance density (ratio of premiums to total population) and insurance penetration (ratio of premiums to GDP) although the numbers have improved over the years, but generally very low compared to both developed and developing countries. For example, in 2008 insurance density for industrial countries stood at \$3,656 while for India it is \$47.4 (\$41.2 life insurance). The insurance penetration in India for life 4.0 and for non-life is 0.6 (Swiss Re, 2009). Deregulation has created an even playing field for both domestic and foreign affiliated firms in terms of transfer of technology, product development, competitive pricing and services, and professional management. The issue of firm efficiency and productivity will play a major role in a highly competitive deregulated insurance industry in India in the future. There is currently no study that measures technical efficiency of

multiple firms using data from multiple years as well as identifies the causes of inefficiency in Indian life insurance industry. This study is the first attempt to assess technical efficiency and total factor productivity of life insurance firms in India using five years panel data in the deregulation era. The empirical analysis uses data envelopment analysis (DEA) method to measure firm level efficiency and Malmquist productivity index for dynamic productivity analysis. Further, the study also investigates the impact of organizational characteristics on the level of inefficiency using a truncated regression.

The structure of the paper is as follows: section 2 discusses the background and an overview of the Indian insurance industry section 3 lays down definition and measure of inputs and outputs including the dataset used and followed by section 4 on the theoretical model for estimation. Section 5 deals with the results and discussions, and, finally, section 6 offers some concluding remarks.

BACKGROUND AND OVERVIEW OF INDIAN LIFE INSURANCE INDUSTRY

Globalization and financial reform policies initiated in early 1990's finally created Insurance Regulatory and Development Authority (IRDA) in 2000 to oversee and regulate the industry and opened the market for private players. Since the introduction of the deregulation policy in 2000 the market share for LIC which enjoyed a regulated monopoly status decreased from 100 percent in 2000 to 60 percent in 2010 with nearly 22 new insurers in the market. Despite the fact that market share for LIC has fallen by 40 percent in last 10 years, currently LIC collects three times the premium it used to collect prior to liberalization which suggests the fact that the industry is growing at an unprecedented rate (Sandip, 2010). The growth of new policies issued between 2004 and 2009 increased by 94 percent and the growth of premium underwritten by life insurers between 2001 and 2009 increased by 343 percent (IRDA 2009).

Although the dynamics of Indian insurance market and its future growth potential has been investigated by several researchers a limited number of studies have been devoted to exploring the efficiency and productivity of the insurance firms in the deregulation era. (Rodrik and Subramanian, 2003; Guerrero and Singh, 2004; Sinha, 2004; Tone and Sahoo, 2005; Singh, 2005; Sinha and Chatterjee, 2009) Tone and Sahoo (2005) undertook the first empirical study analyzing cost efficiency of the state owned Life Insurance Company of India (LIC) using a modified version of data envelopment analysis. The authors recognized the limitations of their study due to small sample size and shorter study period (dimensionality problem) and recommended future research on the same direction using data on multiple firms for multiple years in the deregulation era. Sinha (2007) estimated technical efficiency for four state owned non-life insurers using seven years (1997-2003) data and applied DEA method. The authors found that the relative efficiency levels for three firms converged toward the terminal level while one firm (New India Assurance Co.) maintained the highest efficiency for all years.

Sinha (2007) estimated technical efficiency and total factor productivity of 13 life insurers using three years data (2003-05) and found that the total factor productivity growth for private firms are higher than the government owned LIC. Sinha and Chatterjee (2009) estimated cost efficiency of 13 life insurers using four-year data and applied the DEA method found that except for the state owned LIC overall efficiency for all firms increased during the first two years but the trend reversed during the last two years. It is recognized in the DEA literature that the efficiency scores are highly sensitive to the selection of inputs/outputs and the outlier observations in the sample. Hence, the stability of the efficiency scores is often tested conducting some sensitivity analysis. However, none of the studies examine the robustness of their results using sensitivity analysis and check if the presence of state owned giant LIC in the data produce any bias in the measure of efficiency and productivity measure for the rest of the firms. Further, no study in the past attempted to identify the causes of inefficiency (technical or cost) for the inefficient firms and provide policy suggestions relevant to the regulators and the firm managers. The current study is unique from several aspects that it estimates the technical efficiency and total factor productivity of 14 life insurers using most recent information available and applies the slack analysis to identify input

overuse and regression analysis to examine the influence of firm characteristics on the measure of inefficiency. We also use sensitivity analysis and re-estimate the dynamic efficiency and productivity growth for the firms in the sample without the state owned giant insurer LIC. It is hypothesized in this study that if the deregulation has had the desired effects then productivity of the firms should improve over time. The total factor productivity growth measured in this study is defined as the sum of the change in the output due to efficiency change and technical change using Malmquist index approach (Grosskopf, 1993; Fare et al. 1994).

Past studies analyzing impacts of deregulation in insurance industry found that generally, it improves the availability of services provided by the financial companies and increases efficiency through competition. However, Cummins and Santomero (1999) found deregulation could deteriorate the efficiency and productivity of financial institutions (Griffell-Tatje and Lovell, 1996; Yoshihiro et al., 2004). There has been an extensive research examining the role of consolidation, organizational form, and distributions systems in the U.S. insurance industry such as, Cummins, Tennyson, and Weiss (1998), Cummins, Weiss, and Zi (1999), and Berger, Cummins, and Weiss (1997). To the contrary, studies measuring efficiency of Indian life insurance industry during the deregulation era are very limited. The current study extends the existing research by conducting a more extensive analysis of productive efficiency and total factor productivity of Indian life insurance industry and investigates the cause of inefficiency using a two-stage approach (DEA and econometric methods) and applied to a five-year panel data for 14 firms.

DEFINING AND MEASURING OUTPUTS AND INPUTS

One of the complex questions in efficiency analysis for insurance firms is how to measure intangible outputs for insurance firms which are analogous to financial institutions. In the financial services sector three principal approaches have been used to measure outputs: the asset or intermediation approach; the user-cost approach; and the value-added approach (Berger and Humphrey, 1992). Consistent with the majority of the studies in the literature (Cummins et al. 1996; Harwick, 1997; Cummins and Zi, 1998; Cummins and Rubio-Misas, 2002; Ward, 2002; Hussels and Ward, 2006; Leverty, Lin, and Zhou, 2004) this study adopts a modified version of the value-added approach to identify and measure insurance outputs. Life insurance companies provide two main services to its customers risk bearing/risk pooling services and financial intermediation. Cummins and Zi (1998) and Berger, Cummins, and Weiss (1997) use incurred benefits by the line of services as a measure of risk bearing/risk pooling and addition to reserve as financial intermediation. Incurred benefits are payments received by the policy holders in current year which is a good proxy for risk bearing/risk pooling functions since it accounts for the amount of funds pooled by the insurers and redistributed it to the policy holders as compensation for incurred events (Leverty et al, 2004, Yuengert, 1993; Berger et al. 2000).

Cummins et al. (1999), argue that benefit payments and increase in policy reserve are correlated with real services provided by insurers such as, benefit administration in group insurance. Cummins and Rubio-Misas (2002), Greene and Segal (2004), Leverty et al. (2004) Berger et al. (1997), Cummins et al. (1999) and Cummins and Weiss (2001) use total value of investment while Mahlberg and Url (2000), Diacon (2001), Yoshihiro et al. (2004), and Cummins et al. (1996) use additions to reserves as output which represents additional accrued benefits to policy holders. The current study uses income from investment from policy holder's funds as a measure of output from financial intermediation function of the life insurers. Unlike the measure of outputs, inputs measures in life insurance industry are more consistent because the units of measurement are more tangible and directly observable. Insurance companies use labor, business services and material, financial equity and debt capital as inputs. In a comprehensive study of efficiency analysis of insurance industry Eling and Luhn (2008) found 61 out of 91 studies use at least labor and capital as inputs and most of them also added a third category (miscellaneous; mostly business services). Cummins and Weiss (2001) argued that the use of equity and debt capital as inputs for life insurance is consistent with the modern theory of firm, where a firm's technology includes all

contractual relationships involving a firm. In addition, the financial theory of insurance pricing considers insurance as a risky debt in which financial equity of the insurance company plays a crucial role in reducing firm's risk of default (Cummins and Danzon, 1997).

For efficiency analysis of insurance industry Daicon (2002), Zanghieri (2009), and Tone and Sahoo (2005) used both debt and equity capital as inputs while Greene and Segal (2004) and Cummins et al. (1996) used equity and physical capital (rent, equipment, building, depreciation) in addition to operating expenses and commissions as inputs. Following Tone and Shao (2005) and Sinha and Chatterjee (2009) this study uses debt capital, equity capital, operating expenses (expenditure on sales, administration, and managerial staff), and commission as inputs in the DEA model for efficiency analysis.

METHODOLOGY AND THE DATA

We estimate efficiency using data envelopment analysis (DEA). The DEA does not require the specification of a production function but rather computes efficient 'best practice' production frontier based on linear combination of firms in the industry. It provides efficiency scores for individual firms as their technical efficiency measure, with a score of one assigned to the 'best practice' frontier. Further, the use of DEA is also consistent with the Malmquist approach (which is a standard technique for measuring productivity change and efficiency change over time) because it is based on DEA. To save the space, we do not provide the detail methodology in this article. Interested readers can further refer to Ali and Seiford (1993), Charnes et al. (1994), Fare et al. (1985, 1994), Cummins and Zi (1998), and Cummins and Weiss (2001).

The data for this study are collected from the Annual Report of the Insurance Regulatory and Development Authority (IRDA), Government of India for various years. Although currently 22 life insurers are operating in India not all of them started operation during the study period i.e., 2004-05 and 2008-09 (five years). Hence our panel data consist of 14 life insurers (13 private and 1 public), which accounts for 90 percent of the market share for life insurance industry. In summary, the DEA model measuring technical efficiency uses two outputs: benefits paid and income from investment; and four inputs: equity capital, debt capital, commissions, and operating expenses. In consistency with the recent studies in the literature all inputs and output variables are deflated to real terms using consumer price index (CPI) data for various years collected from the Ministry of Labor, Government of India website. Descriptive statistics of the inputs and outputs used in this study are reported in the upper half of Table 2.

Lower half of Table 1 reports variables representing firm characteristics used in the Tobit regression. In an effort to explain the efficiency differences among insurers the study uses the two-stage approach, common in insurance literature where efficiency scores obtained from first-stage DEA method are regressed against a set of environmental (exogenous) variables (Diacon, 2001; Zanghieri, 2009; Hussels and Ward, 2006; and Fecher et al. 1993). The firm characteristics such as, distribution ratio (proportion of commission paid to total costs incurred), claims ratio (proportion of claims to gross premiums), and solvency ratio (proportion of equity capital to total asset) are assumed to have some effect on their performance level. Reporting solvency ratio to the regulatory authority (IRDA) became mandatory for all insurers starting financial year 2004-05. In addition to the firm characteristics mentioned above (three ratios), firm size (natural log of total asset) and market share (share in the total premium written) for each firm are also included as independent variables in the Tobit model. Descriptive statistics for variables used in the Tobit model, including technical efficiency scores under VRS for each year under study are reported in the lower half of Table 1. Non-availability of information on solvency ratio for SAHARA for 2004-05 led us to drop that year from our dataset to make it a balance panel for the regression analysis. Hence, the Tobit model uses 4-years panel data (2006-2009) for 14 firms.

*Natural log of fixed assets, **Efficiency scores from DEA analysis, Values are in real numbers deflated by Consumer Price Index

We use incurred benefits as the output for risk bearing/risk pooling service for the life insurer and income from investment from policy holder's funds as a measure of output from financial intermediation function of the life insurers. Inputs are measured as debt capital, equity capital, operating expenses (expenditure on sales, administration, and managerial staff), and commission in the DEA model for efficiency analysis. The firm characteristics such as, distribution ratio (proportion of commission paid to total costs incurred), claims ratio (proportion of claims to gross premiums), and solvency ratio (proportion of equity capital to total asset) are assumed to have some effect on their performance level plus firm size (natural log of total asset) and market share (share in the total premium written) are also included as independent variables in the Tobit model.

ANALYSIS OF RESULTS FROM THE DEA MODEL

Technical efficiency scores obtained from the DEA model for each year under study are not reported instead scores for the most recent year (2008-09) are reported in Table 2. Column 2 reports efficiency scores under constant returns to scale (CRS) and column 3 reports efficiency scores under variable returns to scale (VRS). It is evident from column 2 and 3 that five insurers out of 14 are fully efficient (i.e., efficiency score equals 1). They are, BIRLA-SUN LIFE, ICICI-PRUDENTIAL, LIC, KOTAK LIFE, and SAHARA.

The least efficient insurers under both CRS and VRS technologies are RELIANCE LIFE and MET LIFE. For inefficient firms the causes of inefficiency are either inappropriate size or misallocation of resources.

Operating on an inappropriate size implies that the firm is not taking advantage of returns to scale, while misallocation of resources refers to the use of inefficient input combinations. Since each firm is compared to a firm of similar size misallocation of resources given the scale of operation is generally believed to the cause of inefficiency.

Table 2: Estimates of Technical Efficiency (TE) and Scale Efficiency (SE) Under Constant Returns to Scale (CRS) and Variable Returns to Scale (VRS) 2008-09

FIRMS	TE(CRS)	TE(VRS)	SE(CRS/VRS)	Scale Error
1. BSLI	1.000	1.000	1.000	-
2. ICICI PRUDENTIAL	1.000	1.000	1.000	-
3. ING VYSYA	0.750	0.766	0.979	IRS
4. LIC	1.000	1.000	1.000	-
5. HDFC STD LIFE	0.959	0.962	0.996	IRS
6. MNYL	0.765	0.783	0.977	DRS
7. RELIANCE LIFE	0.383	0.390	0.983	IRS
8. BAJAJ ALLIANZ	0.733	0.738	0.994	DRS
9. SBI LIFE	0.917	0.920	0.996	IRS
10. KOTAK LIFE	1.000	1.000	1.000	-
11. TATA AIG	0.689	0.708	0.973	DRS
12. MET LIFE	0.410	0.463	0.887	IRS
13. AVIVA	0.782	0.828	0.945	IRS
14. SAHARA	1.000	1.000	1.000	-
Mean	0.813	0.826	0.981	

This table explains the scores of TE under CRA and VRS and SE for the year 2008-09

Column 4 of Table 2 measures scale efficiency which is the ratio of technical efficiency scores under CRS and VRS. A value of scale efficiency equal to one implies a firm is scale efficient and less than one implies the firm is scale inefficient which are marked as either 'DRS' or 'IRS' in column 5. Firms identified as 'IRS' are producing inefficiently small output in the phase of increasing returns to scale (i.e., ING VISYA) and firms marked as 'DRS' are producing inefficiently large output in the phase of decreasing returns to scale (i.e., MNYL).

Table 3: Peers, Weights, and Summery of Input Slacks Based on Technical Efficiency under VRS

FIRMS	Weights for Firms Appeared as Peer for Other Firms					*Input Slacks (%)	
	BSLI	ICICI	LIC	KOTAK	SAHARA	Equity Cap	Total Exp
3. ING VYSYA	0.144	---	---	0.150	0.706	27	6
5. HDFC STD LIFE	0.843	---	0.002	0.155	---	---	26
6. MNYL	---	0.010	---	0.990	---	44	35
7. RELIANCE LIFE	0.168	---	---	0.175	0.656	17	21
8. BAJAJ ALLIANZ	---	0.079	0.007	0.914	---	---	34
9. SBI LIFE	---	0.112	0.008	0.540	0.341	---	---
11. TATA AIG	---	---	---	0.872	0.128	36	15
12. MET LIFE	0.110	---	---	---	0.830	21	22
13. AVIVA	0.305	---	---	---	0.695	30	25
Peer Counts	5	3	3	7	6		

**No input slacks are observed for the Debt Capital input for any firm*

This table reports number of counts a firm appears as peers for another firm (bottom row) and its weights which forms the efficient frontier for the inefficient firms (reported in column 1)

Firms that are using excessive inputs compared to their peers are further analyzed in terms of 'Peer Counts' and 'Input Slacks' in Table 3. Table 3 reports number of counts a firm appears as peers for another firm (bottom row) and its weights, which forms the efficient frontier for the inefficient firms (reported in column 1). Firms that appear more frequently as peer for other firms are called robustly efficient. They are robustly efficient because their production practices are such that these firms are

frequently used to form the efficient frontier for the inefficient firms in the data. For example, KOTAK, SAHARA, BSLI, ICICI, and LIC are robustly efficient because they appeared, 7, 6, 5, 3, and 3 times, respectively as peers for other firms. The interpretations for the weights assigned to the peer firms is that firms MNYL and BAJAJ ALLIANZ should follow the production practice of KOTAK more closely than other firms in the peer group because the weights assigned for KOTAK are 99 and 91 percent, respectively. Column 7 and 8 of Table 4 presents input slacks for 'equity capital' and 'operating expenditure' for inefficient firms in the sample. A slack variable represents the amount of excess expenditure on an input in the production process. In other words, it is the amount (in Rupees) by which the expenditure on a particular input could be reduced without altering the production of outputs. It is evident that MNYL and TATA AIG could reduce its use of 'equity capital' by 44 and 36 percent, respectively without reducing their current level of outputs. Similarly, MNYL and BAJAJ ALLIANZ could reduce its excess usage of 'operating expenditure' by 35 and 34 percent, respectively, without reducing their current level of outputs and still can remain on the same production frontier. Using multi-period analysis inter-temporal input correspondences are defined to derive estimates for changes in productivity over time, 2005-09.

Table 4: Productivity, Efficiency, and Technological Change Indices Five-Year average (2005-2009)

FIRMS	EFFCH	TECHCH	PECH	SECH	TFPCH
1. BSLI	1.225	0.996	1.218	1.006	1.221
2. ICICI PRUDENTIAL	1.507	0.986	1.499	1.006	1.486
3. ING VYSYA	1.356	0.993	1.171	1.158	1.347
4. LIC	1.000	0.963	1.000	1.000	0.963
5. HDFC STD LIFE	1.205	0.997	1.180	1.022	1.201
6. MNYL	1.108	0.977	1.109	0.999	1.083
7. RELIANCE LIFE	0.787	1.058	0.790	0.996	0.832
8. BAJAJ ALLIANZ	0.925	1.111	0.927	0.998	1.028
9. SBI LIFE	1.003	1.02	1.004	1.000	1.024
10. KOTAK LIFE	1.308	0.944	1.135	1.153	1.236
11. TATA AIG	0.991	1.051	0.998	0.994	1.042
12. MET LIFE	0.827	0.944	0.845	0.979	0.781
13. AVIVA	1.209	0.912	1.136	1.064	1.103
14. SAHARA	1.000	0.646	1.000	1.000	0.646
Mean	1.086	0.962	1.059	1.025	1.048

This table reports Malmquist productivity indices and the decomposition of these indices into efficiency change (EFFCH) and technological change (TECHCH), pure technical efficiency change (PECH), scale change (SECH), and total factor productivity change (TFPCH) over the sample period. $TFPCH = EFFCH + TECHCH$; $EFFCH = PECH + SECH$

Table 4 reports Malmquist productivity indices and the decomposition of these indices into efficiency change (EFFCH) and technological change (TECHCH), pure technical efficiency change (PECH), scale change (SECH), and total factor productivity change (TFPCH) over the sample period. The numbers reported are averages for entire study period. The results indicate that the total factor productivity (TFPCH) increased at an average rate of 4.8 percent (1.048-1.00 times 100) per year over the entire study period. On average this improvement is ascribed to efficiency improvement (EFFCH) of 8.6 percent and a technical regress of (TECHCH) of -3.8 percent.

The interpretation for technical regress is that the technology in the Indian life insurance industry now require more inputs to produce a given output vector than 2004-05. Hence, changes in technology are needed if the industry is to become more productive. The efficiency change index (EFFCH) in turn, is attributed to pure efficiency improvement (PECH) of 5.9 percent and a smaller improvement in scale efficiency (SECH) by 2.5 percent. Out of 14 insurers in the sample total factor productivity decreased for only 4 firms during the study period. Two fastest growing firms in terms of productivity are ICICI-Prudential and ING-Vysya which experienced 48.6 and 34.7 percent annual growth, respectively. Interestingly, for both firms growth in productivity comes entirely from efficiency change (50.7 and 35.6, respectively) because both firms experience technological regress. It is evident from Table 4 that for the

Indian life insurance industry deregulation has an overall positive impact on the growth of total factor productivity.

In order to check the impact of the measures of Malmquist indices when the state owned giant LIC (having 60 percent of the market share) is not included in the dataset we conducted a sensitivity analysis by re-estimating the Malmquist index for the 13 firms. Surprisingly we found that the overall total factor productivity increased from 4.8 (Table-5) to 13.2 percent when we dropped LIC from the sample (the results are not reported in this paper). Further we found that the increase in productivity in our sensitivity analysis is mainly from technological change (10.6 percent). Since LIC appeared as 'Peer' for three insurers (Table 4) it is expected that its absence from the sample would affect the efficiency change and productivity change indices for these firms. We found that the total factor productivity of HDFC-Std-Life and BAJAJ-Allianz increased significantly from 20.1 and 2.8 percent (Table 4) to 29.7 and 32.4 percent respectively. Significant increase in productivity is also observed for BSLI, ICICI-Prudential, and SBI-Life.

ANALYSIS OF RESULTS FROM THE REGRESSION MODEL

The objective of regression analysis is to explore the influence of firm characteristics on the relative inefficiency of the firms. These characteristics are generally fixed or quasi-fixed over the study period. The underlying assumption is that even though all firms encounter the same production possibilities set but deviation from the frontier could be due to either inefficiency and/or those fixed and quasi-fixed factors associated with the type of firm and the business emphasis (Cummins et al., 1996). For example, characteristics such as, organization form, market share, and size or scale of operation are hard to change over a short period of time such as 5-6 years. Following Cummins et al. (1996), Rezitis (2006), Hussels and Ward (2006) we conducted a regression analysis using technical efficiency scores (VRS) as dependent variable and various firm characteristics as independent variables. Since the dependent variable (technical efficiency) is censored at 1.0 upper limit and 0 lower limit (by default) Tobit regression is an appropriate specification for our model. The empirical model estimated is presented below:

$$TE_{it} = \alpha_{it} + \beta_1 DIST_{it} + \beta_2 CLAIMR_{it} + \beta_3 SOLV_{it} + \beta_4 SIZE_{it} + \beta_5 SHARE_{it} + \beta_6 SHARE_{it}^2 + \beta_7 DUM + \varepsilon_{it}$$

Where i is the firm, t is time, TE is the technical efficiency, CLAIMR is claims ratio, SOLV is the solvency ratio, SIZE is the size of the firm, SHARE is the market share, and DUM is a dummy variable =1 if the firm has both life and non-life business operations, 0 otherwise. Both pooled cross-section and time-series panel regression are estimated and the results are reported in Table 5.

In order to explore the factors associated with the levels of efficiency the technical efficiency scores under VRS are regressed on a variety of organizational and environmental variables. In our two-stage DEA analysis efficiency scores from the first-stage DEA are regressed against firm specific factors not related to inputs/outputs of the firms. Most of the studies using two-stage efficiency analysis use Tobit model for censored data since input-oriented technical efficiency scores are restricted within the range of 0 and 1. (Fecher et al., 1993; Cummins et al. 1996; Hussels and Ward, 2006; Diacon, 2001; Leverty et al., 2004; Zanghieri, 2009) However, some studies use one-stage analysis, such as conditional mean analysis as opposed to Tobit analysis (Eling and Luhnen, 2008; Greene and Segal, 2004; and Battese and Coelli, 1995). The current study uses truncated regression instead of Tobit regression in the second stage efficiency analysis however we did not use the bootstrap methodology as proposed by Simar and Wilson (2007). Consistent with the past studies the literature we use three main ratios representing institutional characteristics – the distribution ratio (proportion of commission paid to total costs incurred), the claims ratio (proportion of claims to gross premiums), and solvency ratio/margin. The solvency ratio measures

the ratio of the amount of available solvency margin to the amount of required solvency margin (The Chartered Accountant, 2004). It is hypothesized that the distribution ratio would be low for companies which are linked to banks and can use their network, claims ratios for life insurance companies might be viewed as a proxy for maturity (Fecher et al., 1993). Studies in the past often choose company size as a key environmental variable since changing size is not a decision variable. Following Diacon (2001), Hussels and Ward (2006), Zanghieri (2009), Eling and Luhnen (2008) this study uses natural logarithms of total assets as a measure of size. The other two variables used in the regression are market share (share of premiums to total premium) and a dummy variable capturing the form of business the company is engaged in ($D = 1$ if the company is in both life and non-life market, $D = 0$, otherwise).

Although, major discussion in this study is focused on Truncated regression results using panel data for comparison purpose ordinary least square (OLS) regression results using pooled data are also reported in Table 6. Following insurance industry literature initially a tobit model was estimated however, the results obtained from the truncated model suit our data better. Further, due to methodological advantage of truncated regression over tobit model discussed in the paper, finally a truncated regression model is used in this study. It is hypothesized that the variables claims ratio, distribution ratio, solvency ratio should be positively related to the technical efficiency and firm size would effect efficiency in a U-shaped relationship i.e., a non-linear relation. The overall results from the truncated model are consistent with the literature. Most of the variables have correct signs and except for the solvency ratio all coefficients are statistically significant. Theoretically the magnitude of the coefficients from a truncated model have no meaning interpretations except for the direction of change, hence the marginal effects are reported in the table. For a correctly specified model (significant sigma) the magnitude of the coefficients from the truncated model is similar to the marginal effects. As expected, the distribution ratio, claims ratio, and solvency ratio are positive. Strong and positive claims ratio suggests higher claims are associated with improved technical efficiency.

Table 5: Coefficient Estimates from Random Effect Truncated Regression and Pooled Regression Using Firm Characteristics: Dependent Variable – Efficiency Scores under VRS (2005-09) Observations = 56

Variables	Truncated Regression			Pooled Regression (OLS)	
	Coefficients	Marginal Effects	t-Statistics	Coefficients	t-Statistics
Constant	3.5082	3.4992	4.493*	3.465	4.177*
Distribution Ratio	0.0040	0.0110	1.613**	.0004	1.607**
Claims Ratio	0.0312	0.0310	6.096*	0.031	5.778*
Solvency Ratio	0.0173	0.0172	0.829	0.019	0.873
Firm Size	-0.5234	-0.5223	-3.853*	-0.516	-3.579*
Firm Size ²	0.0218	0.0217	3.718*	0.021	3.415*
Market Share	-0.0146	-0.0145	-4.697*	-0.014	-3.341*
^a Dummy Variable (0, 1)	---	---	---	0.031	0.647
R-squared	---	---	---	0.5357	---
Sigma	0.138	---	10.210*	---	---
Log of the Likelihood	31.830	---	---	---	---

^aThe dummy variable indicates 1 if the firm has both Life and Non-life business operations, 0 otherwise;

*Significant at 5 percent or above; **Significant at 20 percent

Positive but insignificant solvency ratio suggests higher efficiency is associated with higher ratio. Diacon (2001) found similar relationship in his study of using life and non-life insurance data from six European countries. The signs on the variable size and size-squared are as expected and both are highly significant confirming our hypothesis about the non-linear relationship between the size of the firm and efficiency. The results are consistent with the literature for example, Diacon (2001) and Eling and Luhnen (2008) in their studies using life insurers data found negative sign on size and positive sign on size-squared. Negative and highly significant coefficient on market share implies that bigger firms fail to exploit the economics of scale enhancing their technical efficiency. Conventional wisdom suggests that a more efficient firm should have a bigger market share since more people would be willing to buy a policy from

an insurer that produce more efficiently. A positive and insignificant coefficient on the dummy variable in the OLS regression suggests companies that have both businesses are more efficient than firms that specialize in life insurance. Intuitively this might be true because firms having both businesses use the network and the distribution system including their clientele base more efficiently and cost effectively raising productivity than other firms.

The variables in the OLS regression explain 54 percent variability in technical efficiency in the Indian life insurance industry. The wide dispersion in efficiency scores within the industry is not accounted for by the differences in firm characteristics included in the model. If less efficient firms adopt the best practice technologies of those firms that are operating on the frontier, there would be a significant improvement in the overall technical efficiency in the industry.

SUMMARY AND CONCLUSIONS

The technical efficiency estimates for the most recent year under study (2008-09) indicate Indian insurance industry is 82 percent efficient (VRS) however there is a significant variation in the efficiency level among individual firms. The results for the dynamic efficiency analysis measured by Malmquist indices reflect a modest average annual productivity growth of 4.8 percent during the study period. The productivity growth is attributable almost entirely to the efficiency change since the industry experienced technological regress during the study period. The study found that the productivity growth in the industry is mainly dominated by 5 out of 14 most efficient firms. The technological regress is interpreted as the firms need more inputs to produce their outputs in the terminal year (2009) compared to what they needed at the beginning of the study period (2005).

Results from the sensitivity analysis suggest that the presence of state owned giant insurer (LIC) in the data affects the construction of the 'best practice' production frontier significantly. For example, when LIC is dropped out of the sample the average annual productivity increased from 4.8 to 13.2 percent and transformed the technological regress into technological progress. The truncated regression exploring the impact of exogenous firm characteristics on efficiency levels found distribution ratio, claims ratio, and firm size are strongly and positively related to technical efficiency scores.

Our study lacks evidence linking deregulation in the Indian life insurance industry to improved efficiency and productivity because the data used in this study are strictly limited to the post deregulation era. Our study does not find any evidence for association of efficiency and productivity with the institutional set up of a company, however we find that companies that have both life and non-life businesses tend to be more efficient.

JAPANESE FIRMS STRATEGIC LAG IN AFRICA: EVIDENCE FROM THE ALGERIAN MARKET.

Bouyoucef Amine, Tokyo Institute of Technology
Chung Sulin, Tokyo Institute of Technology

ABSTRACT

Japanese MNEs, despite their strong technological advances and great brand image, are lagging behind Korean, Chinese, and European companies in the Algerian market. Taking as reference the consumer electronics & appliances market, this article investigates the reason for the Japanese firms' strategic lag vs. the Korean & Chinese firms' strategic move. It also tries to shed light on the striking internationalization patterns and behaviors of these firms in the Algerian market. Empirical studies, interviews, and a case study (Sony vs. Samsung) therefore are used to deepen the analyses and shape the discussion; managerial implications also are considered.

INTRODUCTION

With the increasingly globalized economies at the turn of the 21st century, Africa, the world's last untapped continent, seemed to be frequently overlooked by MNEs, considered too poor or too risky by business strategists and viewed mainly as a commodity supplier rather than a promising market.

Over the last decade, Africa's economic growth has quickened, bringing new breath to business opportunities. According to the UN, Africa's population will increase from 965 million to 1,996 billion by 2050. Real GDP rose 4,9 percent from 2000 to 2008. The continent's households spent a combined \$860 billion in 2008, more than those in India or Russia. This is projected to rise to \$1,4 trillion over the next decade if real GDP continues to grow as its current pace¹. In this context, Algeria, the third largest African economy in term of GDP and most important market in the Maghreb region, is of great importance for MNEs in terms of market opportunities and geographic position (proximity to Europe and "door to Africa").

Privatization has been sweeping the developing world and Algeria is no exception to this trend. The government launched an economic deregulation in the early 90s under the pressure of the IMF. A centrally planned economy, after decades of recession, is now embracing free market practices, offering unprecedented business opportunities for a wide range of foreign companies². Nonetheless, economic growth and opportunities go along with a great deal of uncertainties and harsh business environment for early entrants. This environment is characterized by mercurial economic policies, foreign companies' ownership regulation (the 51/49 rule), red tape, corruption, limited intellectual property protection, and failure to enforce contracts. Facing such an environment, foreign investors have to decide whether they will be better off becoming early entrants in investing in these countries despite all the difficulties, or to wait and see until the pioneers get "bloodied" and then enter, with the expectation of greater performance (Luo & Peng, 1998).

Since Lieberman and Montgomery's 1988 article "First Mover Advantage," a substantial body of literature on FMA has been published. Numerous empirical researches have demonstrated strong evidence of the existence of early mover effects (e.g., Kevin, Varadarajan, & Peterson, 1992; Mascarenhas, 1992; Robinson, Kalyanaram, & Urban, 1994) and supported the hypothesis that early movers can capture various kind of competitive advantages, such as technological leadership, preemption of key assets, and establishment of entry barriers for follower firms; in other words, early movers are in the best position to determine the rules of the game. Furthermore, many empirical studies showed that market pioneers maintain higher market share than late entrants over time.

In an emerging markets context, first mover advantages may be amplified by the low competitive pressure at the early stage of market liberalization and an important pent-up demand for foreign brands. Potential foreign entrants tend to adopt a wait-and-see strategy because of the tremendous uncertainties in the market, which allow early entrants to establish brand loyalty and shape consumers' perceptions more easily than late entrants (Carpenter & Nakamoto, 1994). Finally, local governments in these regions often treat early foreign investors more favorably. Where such differential treatment is critical for success, foreign firms may have better incentive to move sooner rather than later (Isobe, Makino, & Montgomery, 2000). For these reasons, early movers are expected to leverage their competitive edge efficiently by reaching superior market performances, thus gaining a head start over late entrants.

Pioneering in emerging market conditions carries both advantages and important disadvantages. A firm's ability to turn these disadvantages into long-run advantages can be a critical success factor for the firm. Moreover, a firm's ability to foresee an emergent market opportunity and to actually enter this market as a pioneer can be a great source of competitive advantage. Then, why do some firms have greater abilities to envision EM opportunities and thus seize them by being early entrants?

Taking as reference the consumer electronics/appliances market in Algeria, one of the most promising African markets, this article tries to shed light on the following set of questions:

- Why do Japanese firms lag behind Korean, Chinese and other firms from emerging countries in the Algerian market?
- Why do Korean and Chinese firms have a better ability to see beyond the risks to envision EM opportunities at an earlier stage than their Japanese counterparts?
- Are the Japanese companies risk averse and suffering from strategic blindness toward African markets?

We postulate the hypothesis that Korean and Chinese electronics firms, due to their background, organizational culture, institutional and market conditions, along with their challenger status, have a natural *market acquaintance* with emerging markets conditions with which they are familiar. Conversely, Japanese MNEs, because of their home market conditions and sophistication, increase their incentives toward more similar and advanced markets such as the U.S. or Europe.

International business literature has frequently passed by MNEs' strategies in African countries and is characterized by research paucity in this area; therefore, this article tries to fill in this gap by surveying MNEs' strategies from most prominent Asian countries such as Sony, Samsung or Haier. The objectives of this article are twofold. First, it investigates the internationalization patterns and behaviors of Asian MNEs in Algeria. Second, it studies the underlying reasons of these firms' likelihood to enter an emerging African market.

BACKGROUND

Internationalization of firms according to Uppsala model is an incremental process in which firms gradually increase their foreign market commitment: first, they start exporting to a country through an agent; then, they set up a sales subsidiary and, later, they establish production in the host country (Johansson & Vahlne, 1977). The model focuses on the development of the individual firm, its gradual acquisition, integration, and use of knowledge about foreign markets and operations, and then on its successively increasing commitment to foreign market. It assumes a direct relation between market

knowledge and market commitment. Knowledge is considered as a resource; thus, the better the knowledge about a foreign market is, the stronger the commitment will be.

As firms accumulate investments in a foreign market, they become more likely to invest further in that market; their intrinsic disadvantages may disappear or diminish as they accumulate knowledge. Consequently, a firm with a high level of past investment in a specific foreign market is expected to increase its commitment (Wilson, 1980; Chang, 1995). Moreover, previous studies suggested the existence of a positive relationship between a foreign firm's level of commitment to technology transfer and its local market performance (Isobe, Makino, & Montgomery 2000). When a firm can exploit technological capabilities in a foreign market without losing its value and successfully integrate into the systems of local production and commercialization, the firm can build a strong competitive position in this market (Caves, 1971; Hymer, 1976; Mitchell, 1989, 1991). This is particularly important when a firm enters an emerging market where established distribution channels and technical specifications and designs are lacking (Yan, 1998).

Japanese firms and their Korean and Chinese counterparts have followed two different internationalization paths. Japanese firms are likely to use sequential entry and expansion over time; this may stem from their unique cultural and institutional background. They seem to favor frequent small and gradual investment made over the long-run (Chang, 1995). Japanese firms ("evolutionary firms") are inductive and favor incremental changes, whereas Western firms ("strategic firms") make big investments in a short period and take a deductive approach to formulate strategies and favor radical changes (Kagano, Nonaka, Sakakibara & Okumura, 1985; Rosenzweig, 1993). The Japanese incremental approach to internationalization may reduce the risks of failure, especially in emerging regions characterized by a high level of uncertainty.

Korean and Chinese consumer electronics & appliances firms rose in the space of no more than two decades to become major global players. Because of their late entrant status compared with Japanese firms in the global market, they had to adopt a much more risk-taking attitude to catch up with the industry incumbents. Accelerated internationalization and time compression to leapfrog the industry incumbent appear to be common points of these firms (Cho, Kim & Rhee, 1998). For instance, it took Haier, the major Chinese appliances manufacturer, only six years to expand from export activities to set up production plants overseas, whereas it took the Japanese Matsushita 29 years to do so (Yang, Jiang, Kang & Ke, 2009).

This strategy of being fast followers seems to pay off. Korean and Chinese consumer electronics & appliances firms have been able to win substantial international market share against the competition of Japanese or U.S. incumbents. In 2005, Samsung surpassed Japanese rival Sony and is now the largest consumer electronics firm, and Haier ranked as fourth largest home appliance firm worldwide.

JAPANESE CONSUMER ELECTRONICS & APPLIANCES FIRMS IN THE ALGERIAN MARKET

Japanese consumer electronics & appliances brands are underrepresented in the Algerian market. They seem to show little interest and commitment toward this market despite its important potentialities. Famous brand such as Panasonic, Sharp, Toshiba, or Pioneer are represented via small and medium-sized sales representatives or importers. Typically, these local representatives are multiple brands, i.e., selling Japanese brands among others, with a very limited geographic scope and distribution channels, limited most of the time to Algiers, the capital. Their marketing strategies appear to be poor, and after-sale services rarely exist. For instance, RBC, the local Panasonic representative, has only one showroom in Algiers, offers a limited product line, and rarely advertises in the media. Japanese brands have been imported in Algeria on a small scale for more than two decades through small-sized importers; this is

especially true of TVs, VHS tape recorders and video games. Often considered as high quality products by the Algerian consumers, Japanese firms would gain a lot if they were to increase their commitment in Algeria before the market gets carved up by early entrants such as LG, Samsung, and other strong local brands. It is worth to note that with the exception of Sony, no Japanese consumer electronics firms are pursuing effective strategies in this market.

The Case Of Sony In Algeria

Sony first entered the market in 2001 through an Original Equipment Manufacturer (OEM) agreement with Maghreb Vision, a local medium-sized firm specializing in consumer electronic products manufacturing. Sony licensed its technology and provided technical support for TV assembling. After more than two years of fruitful partnership, as competition from local and global brand intensified, Sony's products – according to Maghreb Vision – were not economically competitive anymore compared to other brands, and the partnership came to an end. Since then, Maghreb Vision started another OEM agreement with a Chinese firm.

In September 2009, Sony officially (re)entered the Algerian market through an exclusive sales representative agreement with Hasnaoui Group, a large and diversified firm operating in many sectors. Sony Gulf FZE, Sony's branch for the Middle East and African region, provides technical, marketing, and management training support to the local firm. Concerning the distribution channel, Sony opened two Sony centers in Algiers and Oran, four franchised Sony stores, and is planning to pursue a dynamic distribution network development policy. Information about market share and revenue were not available from the local representative due to its short-term market operations.

It took Sony six years to return and increase its commitment in the Algerian market. In effect, as Sony Gulf FZE's CEO noted, "we carefully took our time to enter the market, but we had to choose the right partner to match our ambitions"³. In the long run, when investment conditions will get better, setting up a plant is one of the strategic objectives of the firm, as pointed out by Hasnaoui Group's executives.

KOREAN AND CHINESE CONSUMER ELECTRONICS & APPLIANCES FIRMS IN THE ALGERIAN MARKET

Korean and Chinese firms broke into the Algerian market between the late 1990s and the early 2000s. LG started its local operations first, in 1998, through a sales representative and OEM partnership with Essalem electronics, to produce washing machines, air conditioners and refrigerators for the local market, and then established a wholly-owned subsidiary in 2010. The firm claimed 7% market share in 2010. Samsung, between 2002 and 2005, established export operations via a representative office and various local importers and distributors, and, in 2006, entered into an important partnership with Cevital, the largest private company in Algeria, which resulted in the creation of Samha Home Appliances (refer to the following case study). Haier, the biggest Chinese home appliances & consumer electronics firm, operates SODINCO, an industrial complex established in 2005, manufacturing a wide range of appliances. Haier has three showrooms and 33 points of sale in 22 Algerian cities.

The Case Of Samsung In Algeria

Samsung started export activities in 2002, and agreed to an ambitious partnership with Cevital, the largest private group in Algeria with US\$2,5 billion turnover in 2009. The partnership resulted in 2006 in the creation of Samha home appliances. The year 2009 marked a turning point for Samsung in Algeria, with the opening of the biggest Samsung plant in Europe and Africa, with a capacity of 1,5 million items per year. The manufacturing facility will produce flat-screen TVs, washing machines, refrigerators and air conditioners. This project required US\$100 million investment, fully insured by Cevital. Samsung

intends to meet local demand and export surpluses to European and African markets. With 1,600 employees, the plant currently produces 200,000 TVs, 100,000 refrigerators, 150,000 air conditioners and 100,000 washing machines. The firm intends to triple this production by 2011. Samsung in Algeria is pursuing an extensive distribution strategy. By the end of 2010, the firm will have 15 national distributors supplying 50 Samsung stores and 1,200 multi-brand retailers across the country. The company claimed 40% market share in 2008 (market leader), with a sales value worth about US\$96 million.

DISCUSSION & CONCLUSION

According to our research, this article provides empirical and theoretical evidence about the internationalization behavior of Japanese, Korean, and Chinese firms in an emerging African market. Supporting our hypothesis, we found that Japanese consumer electronics & appliances firms are laggards in the Algerian market. They seem reluctant to increase their commitment by establishing local subsidiaries or production facilities in the country. Typically, they rely on small or medium-sized local partners, with a low degree of involvement and poor technology transfer. Based on previous studies, Isobe and colleagues (2000), found a positive relationship between a joint venture's degree of strategic importance and a foreign firm's level of technology transfer. The strategic degree of JV's importance positively determines both early entry and level of commitment. Japanese electronics firms appear to be more risk averse than their Korean and Chinese counterparts toward the Algerian market. They are likely to use a sequential entry pattern to reduce the risk of failure. This might stem from their cultural and institutional background, which favors this approach (Chang, 1995).

Furthermore, they tend to favor advanced and sophisticated markets such as the U.S. or Europe, or countries with more cultural similarities, like Asian countries, with which they have more natural *market acquaintance*. The time order and incremental establishment seems to be related to the psychic distance between the home and the host country (Hornell, Vahlne & Wiedersheim-Paul, 1973; Johanson & Wiedersheim-Paul, 1975). The psychic distance is defined by Johansson and Vahlne (1977) as "*the sum of factors preventing the flow of information from and to the market*". Examples are differences in language, education, business practices, culture and industrial development." Since this information flow affects both opportunities and risks perception, we can assume that psychic distance may result in the development within the firm of organizational inertia forces, which make the firm sluggish to foresee and seize new market opportunities. This organizational inertia may limit adaptive response by incumbents because of strong organizational processes and routines (Hannan & Freeman 1984). Organizational inertia may be strong and amplified within Japanese firms, due to their high hierarchical and routine-based management.

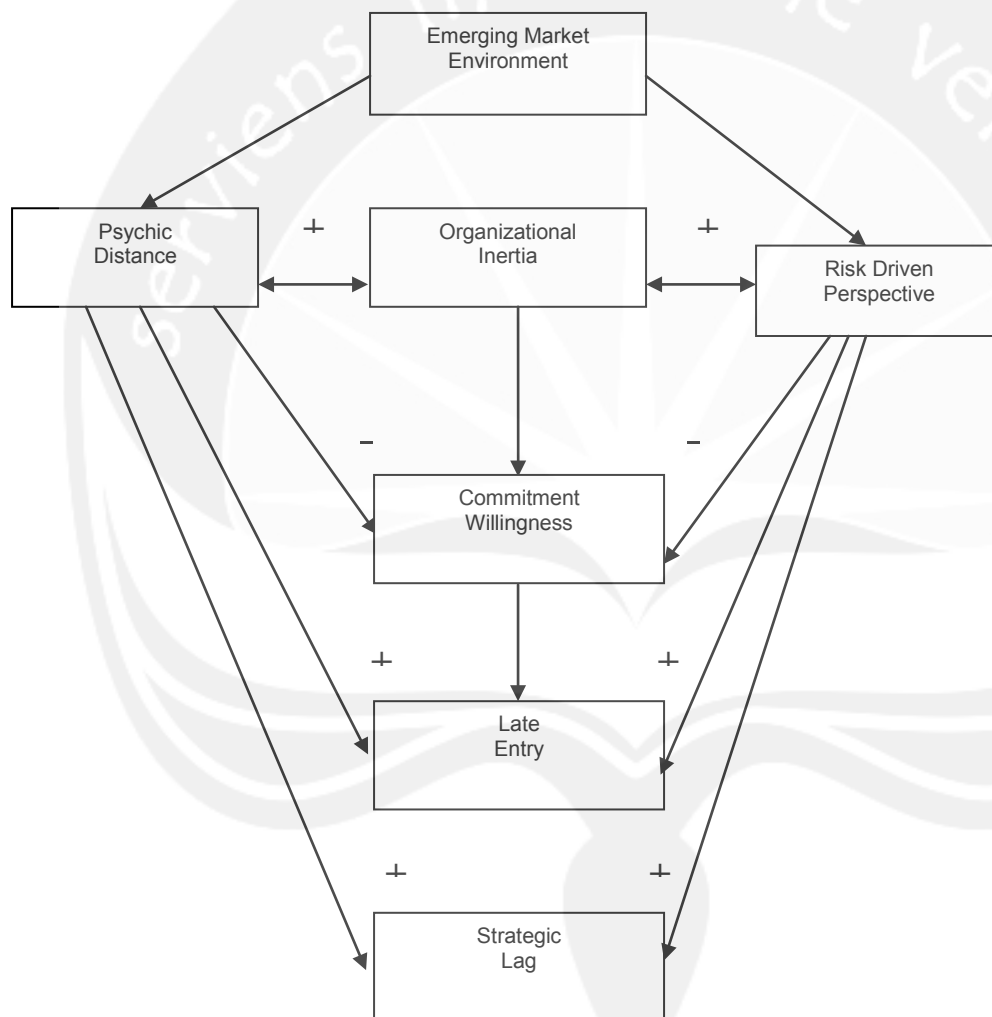

We believe that the Japanese electronics firms' approach of incremental internationalization was highly relevant in the 1970s, 1980s, and 1990s, when they successfully entered the U.S., the European or the Chinese market as early entrants, but might not be the case nowadays, in an era of accelerated internationalization and competition by firms from emerging Asian countries.

Chinese and Korean firms' recipes of success in the Algerian market lay in their ability to treat local environment as an opportunity rather than a threat, and to turn first mover disadvantages into advantages. Samsung, for instance, dealt with ownership percentage restriction by partnering with the largest Algerian private firms, and thus preempted a key local partner in a country where strong local partners are lacking. Likewise, the firm dealt with underdeveloped and fragmented distribution networks by establishing its own extensive distribution channel, thus securing the market supply and preempting strategic geographical space (Lieberman & Montgomery, 1988). In the same way, Samsung dealt with a mercurial economic policy, taxing and disadvantaging imported products, by setting up a plant and benefitting from preferential tax measures. Based on our findings, we believe that Korean and Chinese electronics firms,

due to their background, organizational culture, institutional and market conditions, along with their challenger status, have a natural *market acquaintance* with emerging markets conditions, with which they are familiar. These firms exhibit accelerated and increased commitment patterns toward the Algerian market and tend to consider it as strategic. Haier for instance, consider the Algerian market as a key market in term of market growth potential, market size and geographic position⁴.

Drawing together a diverse set of literature, we attempt to provide a unified framework on the mechanism by which a Strategic Lag or a Strategic Move can emerge within a firm and its operations in an emerging market. This process is laid out in figure 1 and 2.

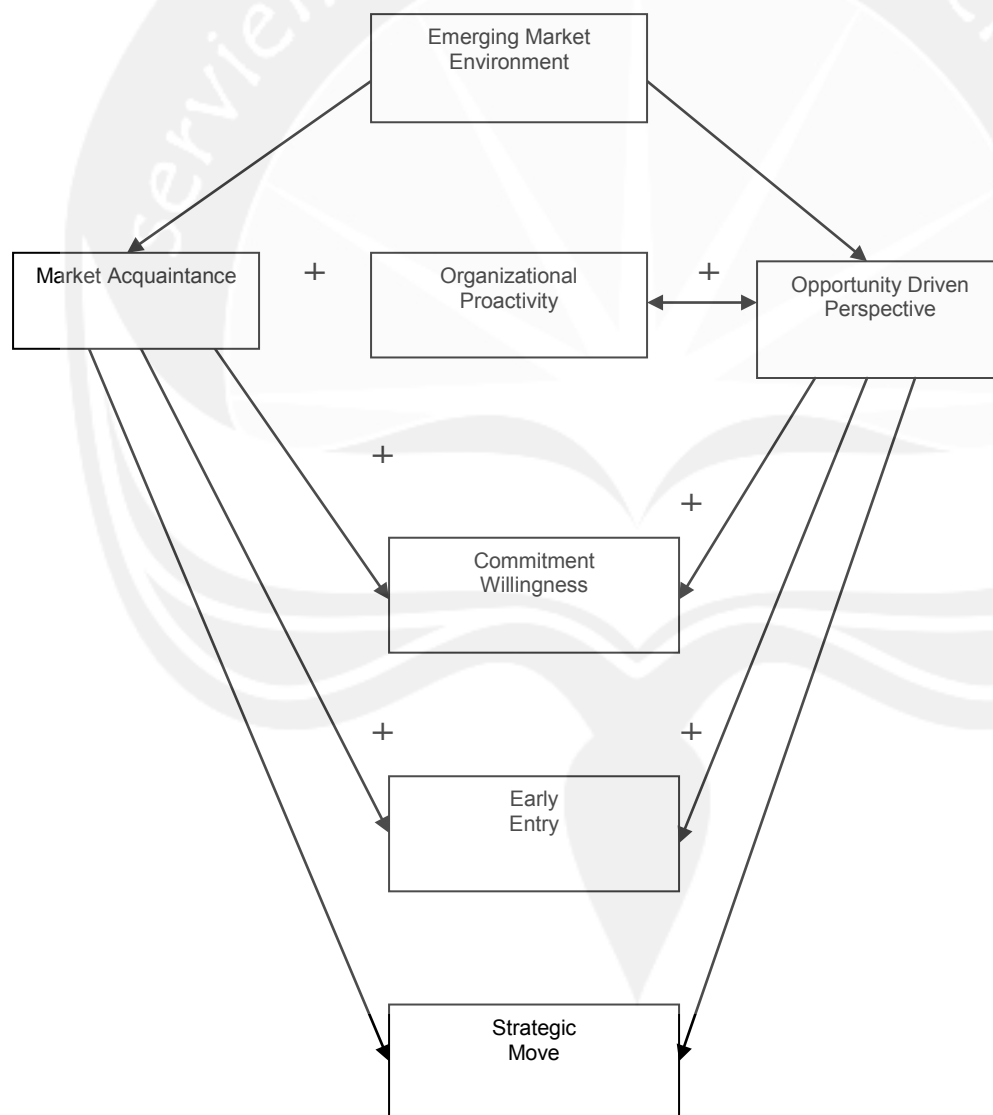

Figure 1: Generation of a strategic lag

In the short run, Japanese consumer electronics & appliances firms should adopt dynamic strategies to catch up and bridge the gap with their competitors in the Algerian market. They should raise their commitment in the market by establishing sales subsidiaries, setting up production plants, selecting better local representative, and increasing their marketing investments to leverage their positive brand image.

Firms entering an emerging market cannot rely solely on a strategy based on overcoming limitations in the business environment. Successful ventures did not assume that the local business environment would become more Western in orientation over time. Instead, they developed a deep understanding of the local environment and tried to leverage the existing infrastructures (London & Hart, 2004). To succeed in newly emerging African markets, MNEs need to go beyond the common risk-oriented perspective. Instead of considering the market as a set of risks, they should consider it in terms of demand opportunities.

STORYTELLING AND CAREER NARRATIVES IN ORGANIZATIONS

Susan J. Kowalewski, D'Youville College
Lauren Waukau-Villagomez, D'Youville College

ABSTRACT

Storytelling has a history as old as Aristotle and many cultures today have an oral tradition. Children grow up with stories, golfers entertain with accounts of wins and losses on the course, parents use them to regale "the good old days". The use of storytelling in organizations has experienced significant growth during the last decade assisting in change management, formulation of short and long term strategy formation, and rightsizing (to name a few functional areas). This paper presents a brief history of storytelling, the uses in organizations, as well as an explanation of career narratives and how they can be utilized by both individuals and organizations to "tell their story."

JEL: Z00

KEYWORDS: storytelling, career narratives, organizations, Native American

INTRODUCTION

The use of storytelling and career narratives in organizations are important skill sets for the 21st century. Storytelling is as old as time and we use it our everyday lives, but often the idea of telling stories is not a practice incorporated in organizations. According to many authors, it has a place and a part to play in organizations today. Parkin (2001) believes that "storytelling has always been an essential and universal human characteristic" (p. 7). Yolen (1979) a famous children's author, notes the stories that touch us the most come from dreams that are the larger dreams that belong to all mankind. Storytelling comes from the oral tradition. The folktales and fairytales, the myths and legends, the tall tales and fables that children love today are shaped from this oral tradition (Savage, 2000). All cultures and societies had or have an oral tradition where culture, traditions, and history were passed down from generation to generation by word of mouth.

The remainder of the paper is organized as follows. In section one, we discuss the relevant literature. Section two discusses the relevance and outlines the uses of storytelling in organizations. Section three presents the storied approach to career narratives. The paper closes with a discussion of some organizational implications of this work.

LITERATURE REVIEW

Early studies related to organizational storytelling and narratives provided a social constructivist perspective in the research of Berger and Luckmann (1967), leading to integral concepts of the importance of the story in organizational culture. Wilkins and Martin (1979) identified specific functions that are integral for stories in organizations that includes making sense of the organization, control, and creating dedication being in the 1970s (Boyce, 1996). They contend that stories increase commitment, which in turn leads to a more trouble-free control function in the organization. Early research and papers related to storytelling set the stage for the future of storytelling as interest in the benefits to organizations increased and became stronger.

Denning (2000, 2005), Parkin (2001), Simmons (2001) and Simmons (2007) have written excellent books on storytelling in organizations. Parkin (2001) examined the resurgence of storytelling during the 1970s reporting that since this period there has been an upsurge in professional and semi-professional storytellers world-wide. Parkin (2001) notes that “there is obviously faith in storytelling as a means of communication otherwise simply would not have survived; people would have stopped using it” (p. 11). She continues by explaining that storytelling is a “means of taking in and making sense of information is an interactive and sharing process, and is therefore more powerful than a passive means such as the images one soaks up from television or computer” (p. 11). She believes that people are “now realizing the full potential and possible applications of this ancient and influential art in the modern world” (p. 12). This is an interesting phenomenon given the fact that there are so many books available over the last ten years alone extolling the power of storytelling in organizations and that when stories are incorporated in organizational settings, positive results are observed. Mary E. Boyce (1996) examined studies in organizational storytelling while ascertaining the multidisciplinary foundations and challenges faced in the utilization of stories in organizations.

McIlveen and Patton (2007) believe that there is no exact definition for narrative career counseling even though it has been around for the last 20 years. Constructivism can be considered an important force in vocational psychology and an example of the constructivist approach to career. Narrative career counseling encompasses subjectivity and meaning, which facilitates self-reflection and elaboration of self-concepts for better self-understanding. The holistic approach involves individuals creating an open-ended story about their lives and careers. Emotion and feelings are considered an important component. Individuals are supported in their stories by counselors. McIlveen and Patton (2007) outline and summarize the forms this approach can entail as follows: spoken and written forms; visual and spatial forms (life lines, life role circles, card sorts, goal maps, construct laddering, family constellation, guided fantasy, etc.); thematic Extrapolation Method (Super’s TEM); life theme career counseling; storied approach; career systems interview; and My Systems of Career Influences (p. 229-232)

There has been a shift career counseling in recent years from a logical positivism view of career counseling to a subjective perspectives view of career counseling (Brott, 2001). In the past career counseling was basically based on logical positivist worldview as a trait and factor approach. However, as the world has become more complicated and views on development altered, so did career and counseling views change.

A postmodern approach to career counseling has evolved. This postmodern perspective is really a constructivist perspective on career counseling which is more relevant to women and people from different cultures. Brown & Brooks (1996) believe that people cannot be separated from their environments and that there are no absolutes. In addition, human behavior can only be understood in the context in which it occurs, and individuals define themselves and their environments. This of course all fits in with assumptions of the constructivist career development model.

Brott (2001) summarizes the change career counseling as follows, “This approach is based on recognizing both continuity and change throughout an individual’s life by incorporating constructivist strategies in career counseling.” Brott (2001) notes “the storied approach explores the client’s world through story development as the client and counselor work together to co-construct, deconstruct and construct life stories. The story development encompasses life experiences in the family school, work and community” (P. 306).

The process involves the exploration of the client’s life stories through examining the clients past, present, and future experiences. Co-construction involves the process of revealing the client’s life through the examination of past and present life history. De-construction looks at the life experiences or stories from different perspectives or angles with the help of the counselor. Construction is basically planning for

the future by writing stories about the future. Questions are posed throughout the approach to help clarify and facilitate the process.

Clark, Severy and Sawyer (2004) believe that differing themes/narratives can be explored in career counseling using the person's values and not a set group of criteria. They see this narrative approach to career counseling as being more sensitive to cultural diverse students in a multicultural world. The person is allowed to select the experiences from their lives to honor and celebrate in their narratives. Individual values and beliefs are recognized in this process.

This paper considers how storytelling and career narratives are utilized in relation to organizations in America. We examine storytelling and career narratives in organizations, the use of storytelling from a Native American perspective and the oral tradition in the modern world of organizations. The next section presents utilization of oral narratives, followed by the conclusion.

RELEVANCE AND STORYTELLING IN ORGANIZATIONS

In taking a closer look at storytelling in the Americas, Native Americans today still have a strong oral tradition that is alive and well. They believe there is power in the spoken word. Ambrose (1975) noted, "The white man writes everything down in a book so that it will not be forgotten; but our ancestors married the animals, learned all their ways and passed on the knowledge from one generation to another" (p. 40).

As we begin to examine storytelling more closely, it is important to realize that, in general, Western culture does not value the oral tradition to the extent that it should be within organizational structure. The traditional view of bedtime stories and an elementary teacher reading to a class are what individuals visualize when storytelling is introduced. Storytelling does not conjure images of CEOs around a boardroom table or a manager utilizing a story to introduce change. McCaleb (2003) contends that print literacy dominates orality in a bad way. Foley (2003) goes even further in saying that the non-textual verbal arts have been labeled "primitive, unsophisticated," or "simple" or "worse yet simply ignored."

Historically, Native American chiefs and elders used stories to teach the members of the Tribe important values or ideas. Throughout the Middle Ages, storytellers were powerful because they communicated important information and knowledge (Parkin, 2001). Storytellers were respected and admired. This is no different from the senior members in modern day organizations, who share their memories and educate new employees through their corporate stories. Parkin, (2001) calls them the "Tribal Elders" of the organization (p. 9).

Leslie Marmon Silko (1996), a Pueblo Indian woman and writer, in an oral presentation explained the following in relation to language and literature and the oral tradition:

Where I come from the words that are most highly valued are those which are spoken from the heart, unpremeditated and unrehearsed. Among Pueblo people, a written speech or statement is highly suspect because the true feelings of the speaker remain hidden as he reads words that are detached from the occasion and the audience... for those of you accustomed to a structure that moves from point A to point B to point C, this presentation may be somewhat difficult to follow because the structure of Pueblo expression resembles something like a spider's web – with many little threads radiating from the center, criss crossing each other. As with the web, the structure will emerge as it is made and you must simply listen and trust, as the Pueblo people do, that meaning will be made (p 48-49).

In today's world, leaders are using stories to explain their point of view or to sway their members. Quong, Walker and Bodycott (1999) believe that the power and place of storytelling in organizations has been well established in relation to learning, communication and socialization. They think life experiences, values, and beliefs are stored in the form of stories in our mind. Stories are important because they tell us all about the storyteller's, knowledge, values, influences and understandings from all aspects the person's life. Boyce (1996) suggests storytelling is critical in organizations to articulate experiences, confirmation and socialization of organizational culture and history, as well as creating vision and strategy.

Individuals in the field of business in areas such as finance, accounting, and strategy tend to be left brain thinkers (logical and analytical). The concepts related to storytelling may be difficult for these individuals to comprehend. Whereas, right brain thought processes center on creativity and influence (Simmons, 2006). According to Simmons (2006), "Story thinking is subjective and sensory; it follows strong emotions and is unpredictable" (p. 257). With individuals and organizations rediscovering storytelling and the benefits from utilizing stories, it's no wonder interest in the topic continues to increase. Storytelling has become an integral skill to possess in organizations in the 21st century. With this being the case, teaching storytelling in college and university (business) classes makes perfect sense (Rhodes, Pullen, & Clegg, 2010). There are approximately 30 institutions of higher education offering degrees in folklore in the United States, yet none of these are specific to business or organizational storytelling (storytelling institute website). So how can organizational storytelling be learned? The answer to this is from books on the subject, practicing, attending conferences, and possibly taking a class—tailoring the learning toward the organizational setting. One of the settings that utilize storytelling routinely is in religious settings; in sermons and homilies.

This was the case during the 56th National Prayer Service at the National Cathedral in Washington, DC. Sharon W Watkins, General Minister and President of the Christian Church (Disciples of Christ), charged United States President and his administration with the following. "What you are entering now, Mr. President and Mr. Vice President, will tend to draw you away from your ethical center...But we, the nation that you serve, need you to hold the ground of your deepest values, of our deepest values. Beyond this moment of high hopes, we need you to stay focused on our shared hopes, so that we can continue to hope, too. We will follow your lead... Watkins said this administration especially has hard times to deal with – the economy and the nation's standing in the world' (Tapper, 2009). The following is the story Watkins told:

The Wolves Inside You

An elder Native American was teaching his grandchildren about life. He said to them, "A fight is going on inside me... it is a terrible fight and it is between two wolves. One wolf represents fear, anger, envy, sorrow, regret, greed, arrogance, self-pity, guilt, resentment, inferiority, lies, false pride, superiority, and ego.

The other stands for joy, peace, love, hope, sharing, serenity, humility, kindness, benevolence, friendship, empathy, generosity, truth, compassion, and faith."

"This same fight is going on inside you, and inside every other person, too", he added.

The Grandchildren thought about it for a minute and then one child asked his grandfather, "Which wolf will win?"

The old Cherokee simply replied..."The one you feed." (Native American Legend, [http://www.firstpeople.us/FP-HTML-Legends/Two Wolves.Cherokee.html](http://www.firstpeople.us/FP-HTML-Legends/Two%20Wolves.Cherokee.html))

Stories have been utilized to provide a “charge” to make a change or provide leadership. Quong, Walker and Bodycott (1999) believe that “to state a truism, however, organizational and leadership stories only become genuine vehicles for enlightenment and learning when people actually listen and seek to unearth their meaning. For many people analyzing leadership stories is unfamiliar territory. When people listen to stories, they rarely question what the narratives convey about the person, the organization or the culture from which the story is derived – all of which can provide rich insights into how and why leadership is exercised” (p. 441-442).

Storytelling can be an effective method for developing leaders for organizations. According to Ready (2002), storytelling has emerged as a preferred approach for teaching leadership effectiveness in many organizations and companies today. Simmons (2007) believes stories can have power and impact on others in the corporate world. In fact, she comes from a business family who were natural storytellers. She defines story as “a re-imagined experience narrated with enough detail and feeling to cause your listeners imaginations to it as real” (p. 19). Parkin (2001) indicates that past research has demonstrated that personal storytelling to be the most notable and remarkable form of communication Rhodes, Pullen, & Clegg (2010, p. 6) point out that great leaders like Lincoln, Reagan, Churchill, MacArthur and Hannibal were communicators and thus storytellers. Daniel Pink in his recent book, *A Whole New Mind*, believes storytelling is critical to success in the business world. Although an organizational environment may seem like an impersonal environment, according to Maguire (1998), storytelling already exists under different names; mentor, training, gossiping, or schmoozing (p. 202).

One needs to learn to tell an effective story to realize benefits. Lisa Waukau (personal communication, July 15, 2010) as Tribal Chairwoman of the Menominee Indian Tribe of Wisconsin in 2004 was asked to address the Grand Council in Wisconsin, which is a meeting of all the Indian Tribes in the state. As part of her speech she told a Menominee story about lacrosse and Awonako. Her sister and traditional storyteller, Leslie Teller, gave her this story to share. She used this story in particular to stress the importance of Native people being visionary.

The Awonako Story

It was the first spring storm when we were first here and the people called for the first lacrosse game in order to appease the powerful thunder gods. And who were these powerful Thunder gods who struck fear in all the people? They were the god's of war and wherever they went they created a fearsome racket. They also brought the rains that brought us wild rice that brought us prosperity and life.

Maeqnapus, the teacher of all good things, paints a ball red because he thinks that will please the Thunder People. The sides are chosen and it is the land animals against the air creatures. He throws this red ball out in Sakakoh and the game begins.

And the animals battle all the way north through Milwaukee, along the cliffs of the dells, over to Green Bay, up the Wolf and north to Lac du Flambeau and over to Lac Courte Oreilles and beyond.

And it looks like Eagle, with his powerful wings is going to win the game on his own, but as he tires; the weakness of the winged creatures are exposed. He finds the Sparrow, even though they are many, they are too light and empty headed to be of any help. And the Crane, there were not enough of them, and besides they are all legs and not much help in this game we call “Little War”. Eagle is exhausted and he drops the ball.

And that is just what the land animals were waiting for. With their swift runners, the Deer People, with Bear alongside for protection, the land animals seemed unstoppable.

The winged creatures met in council with Maeqnapus to talk strategy-how can we to stop this force of nature? The sun had already set for the day and the Bat showed and wanted to join the winged creature's team. The winged creatures told him, "go away, you have nothing to offer, you are too small." Maeqnapus said, "He is here, he wants to help. Let him play."

So that night, while the land animals were asleep, Bat swooped down and took the red ball away from them and with his night vision was able to navigate his way through the trees and the night spirits-he was Awonako-he carried the ball. And he carried the winged creatures to victory. And the Thunderers were appeased. And that brought the warm spring rain that brought the wild rice and that brought prosperity and life to the people.

This old story tells of the wisdom of our people and each of us takes something from these stories. The old people saw the Bat as a humble creature, not one generally honored among the winged creatures, but one who has medicine for survival, for reincarnation, one who forces us to see further than today and tomorrow and beyond that. For you see, the bat flies at night and in the night are born in our dreams and these are the dreams that build the future.

Lisa said that she received many positive comments from the elders who were in attendance at the meeting. They could relate to the storytelling because in the old days that was how lessons were taught and knowledge shared.

Here is another story Lisa shared with a group of Native investors, who were working with the Menominee Tribe. The Menominee are a small tribe in comparison to other tribes and they are not wealthy. They have a casino, but it does bring in a great deal of money. Therefore, it is necessary for them to depend on the support of others. They had to meet with one of their benefactors about continuing their financial assistance in the quest for an off-reservation casino. The other tribe was beginning to have doubts about the benefits of continuing their support as the federal government was not very cooperative. They invited Lisa and other tribal members to meet with them. Lisa (personal communication, August 20, 2010) was asked to say a few words.

I want to tell you are a family story. You know Indians are not like other people – money doesn't always mean the same thing.

Shania is my niece who lives with her grandparents. She is very petite and tiny for her age. She started fancy shawl dancing when she was very young. She and her aunt Sofie would go to pow-wows all over the country where Shania would contest dance.

They were at a pow-wow in Kansas when Shania caught the eye of an older lady, who looked critically at Shania's dance regalia. The older lady told Sofie, I am going to make Shania some beadwork for her outfit and then she will be a champion dancer. She needs better beadwork.

Time passed. Pow-wows came and went. One day the older lady called Sofie on the telephone and told her, I have a yoke and arm guards for Shania's outfit. I want her to wear them to the next pow-wow.

The beadwork was stunning. It complemented Shania's dance style and her outfit. She started to place and to win money at the pow-wows she entered.

Shania's grandparents were stunned that someone out of the blue would take the time and effort to make such beautiful beadwork for someone they didn't know. John and Leslie decided that they had to do something in return for the older lady.

They had an old car that needed fixing up. Indians always need a good car so John started slowly repairing the car. He put new tires on it and he repaired the engine. He fixed it up good as new and he probably could have sold and made some money. It was better than a "Rez Runner." But he didn't.

The Teller family drove the car to Northern Minnesota to the older woman's reservation. She lived in federal housing, where houses do not have garages or driveways or decks.

Shania's grandparents told the woman and her family that they wanted to thank her for making Shania's regalia so beautiful. We have a gift for you too. She tells them that they didn't need to do this. They presented her with the car. She immediately took it for a ride and drove up and down the road honking and waving at her relatives. They had made a friend for all time.

The moral of this story in the Indian way - it is not so much the money as it is the friendship and sharing that makes the difference. We are not Coca Cola or GM. We know we are costing you money. Think of us as the old car in the story. You are helping to fix us up and we will be just like new. Indian people don't think like white people. But we know as Indian people that everything cannot be measured by the white man's cash register.

At the end of the story there was dead silence in the room. Some people had tears in their eyes. The investors did not give the Menominee Tribe the heave ho. They decided to continue funding their off reservation endeavor a while longer. This is an example of the power storytelling related to persuasion and change.

One of the reasons this story is so powerful is because of its connection to emotions or affect. Emotion can be an integral part of learning and cognition. Educators must utilize hot cognition in their teaching. Ormrod (2010) defines hot cognition "as learning or cognitive processing that is emotionally charged" (G-2). Furthermore, she indicates that learners pay more attention to emotionally charged information, they continue to think about the information and they will elaborate on the information. It is important for us to utilize the emotion in our stories because affect has an impact on motivation.

In fact, Rhodes, Pullen, & Clegg (2010) think that storytelling is not passive for the listener, but triggers active thinking on their part. Simmons (2001) observes that good stories induce a trance in the listeners. It is like an altered state of awareness so that we connect to the listeners' unconscious and imaginations. For example, Evans and Metzger (2000) say that as a stylistic element in telling a story, it is important to consider emotion. The storyteller must help the audience feel the emotion of the story.

In the business world this is a must so that workers are motivated and excited about what they are doing. Storytelling can be a nonthreatening coaching tool for personal development and or to enhance organizational performance (Parkin, 2001). Furthermore, she thinks stories and metaphors have an impact on learning and memory. A good story can relate management principles such as decision-making,

leadership, group dynamics, power and politics in a way that captures the attention and enhances memory (Rhodes, 2010). People who tell the best stories “win” according to Simmons (2007, p. 38). She suggests that business people find stories that “win” for them and that is however they define winning. The idea of winning is of course emotion-packed. Everyone wants to win or be a winner.

CAREER NARRATIVES IN ORGANIZATIONS

Career narratives are a form of storytelling. Narratives are often used for a variety of reasons. Career narratives are often utilized for high school students applying for college, students applying to graduate school, or for individuals applying for jobs or making a career change. They may also be used for completing various club membership applications or scholarship applications. Career narratives are set in a “story form”, with the writer utilizing a less stringent format than a resume or curriculum vitae.

Career narratives involve the writing and revision of a sound, logical personal and professional narrative through exploration, experience, and reflection. Individuals are empowered to make amendments related to the situation the narrative would be utilized (Severy, 2008).

An example of a career narrative for a student interested in completing a degree in business may read like this:

I love working with people. It interests me to no end. With this in mind, I plan to obtain a bachelors degree in business-concentrating in human resources management. I have always enjoyed filling out forms and completing computations. This would assist me in working with employees in the hiring process, benefits and compensation, and training compliance. When I establish myself in the working world I want to be in an office, one that is mine alone. I am a person who is self motivated and in dealing with confidential employee issues, this would be imperative.

As of now I have taken steps that will help me obtain my goals. I have taken courses in general business, human resources management, business communications, psychology, and organizational behavior. I will be completing a three-month internship at LNM Bank in their Human Resources Department during the spring 2011 semester. This internship will provide the opportunity to utilize skills I have learned in the classroom into real world situations.

I have developed many skills over the years that I believe will help me achieve my goals. I am diligent, professional, and can obtain, apply and explain information to others. I have learned to be a team player and work well with others. I feel that my goals for the future are possible and that my goals will be achieved.

A career narrative should follow a descriptive structure. It is a way to show the reader something about the writer, present important information related to the writers experience and background related to the topic, as well as demonstrates writing ability. The author is telling a story in a form that is significantly more descriptive than would be found in submission of a resume or application. The concept is to garner the attention of the reader to tell ones’ own story.

Career narratives are many times utilized in human resources (HR) to determine current or future training for employees. HR managers can evaluate future goals and aspirations of employees in greater depth from a career narrative; making a determination as to management training.

CONCLUSION

Storytelling and career narratives are powerful tools or forces in today's business world and important skill sets for the 21st century. Storytelling motivates, it touches peoples' emotions, and it helps people remember the message. Organization leaders should not be afraid of using storytelling, instead it is a way to enhance their ideas.

The transition from storytelling to career narratives is a natural evolution. A career narrative is a descriptive structure. The author is telling a story in a form that is significantly more descriptive than would be found in submission of a resume or application. Narratives provide self-evaluation, understanding of one's career, and amplifying the power of a person's story (Rehfuss, 2009). The concept is to garner the attention of the reader to tell ones' own story. This process can help individuals assess where they are in their career and changes they can make in their lives, especially during these economic times.

A limitation of this paper is the amount of qualitative and/or quantitative research supporting the impact of storytelling in organizations. Future research should include an analysis of storytelling and career narratives in today's economic conditions. "The story is something that comes from outside. But the meaning is something that emerges from within. When a story reaches our hearts with deep meaning, it takes hold of us. Once it does so, we can let it go, and yet it remains with us (Denning, 2001, p. 195). Storytelling and career narratives are important tools in every organization and business person's skill set.

LEGAL, FINANCIAL AND ORGANIZATIONAL FRAMEWORK FOR ESTABLISHING WATER USERS ASSOCIATIONS AND RELATED DECISION MAKING ISSUES

Bojan Srdjevic, University of Novi Sad

Zorica Srdevic, University of Novi Sad

Sanja Pantelic-Miralem, Public Water Management Company Vode Vojvodine

Bosko Blagojevic, University of Novi Sad

Kosana Suvocarev, University of Novi Sad

ABSTRACT

Paper presents new research results obtained during recent studies of legal, financial and organizational prerequisites to establish the water users associations in Vojvodina Province in Serbia (Europe). A procedure for launching a small scale water users association is also proposed based on real field data about two-fold irrigation and drainage systems, exposed interest of small farmers in several villages, and continuous support to the whole idea by public water management company globally responsible for water sector in the Province. At a proof of concept level, decision-making process is simulated assuming water users assembly as a group of representatives. By combining multi criteria method analytic hierarchy process with social choice (voting) method Borda count it was shown that convincing decision making framework is possible to establish and produce good final solutions (decisions).

KEYWORDS: water users association, decision-making, combining multi criteria and social choice methods

INTRODUCTION

Water Users Associations (WUAs) are irrigation oriented organizational forms dealing with food production practice in most of countries and for many years. According to Stacey (1999), they are trustful concept and mean of gathering water users, stakeholders and politicians in common effort to improve operation and maintenance of irrigation systems, but also instruments in regulating water rights, effectiveness and reliability in water delivery on a long-term basis. Fundamental characteristic of all WUAs models is sharing and distributing responsibility among involved participants in managing business and technical control related to irrigation, its outputs and impacts on societal welfare.

In reviewed typical case examples world-wide politicians participate in certain WUA's activities but do not have significant influence in decision processes. Recognizing challenges in creating first water users associations in Vojvodina Province, on-going research at the University of Novi Sad is dedicated to this important strategic national interest. Typical WUA's characteristics are notified in several studies and technical papers, and we also suggested preconditions that should be satisfied to enable creation of such associations in the Province following experience (good and bad) of some other countries in the region, mainly in central and south-eastern Europe.

In Vojvodina Province, shown at the Figure 1, there are 2 million inhabitants, many of them strongly dependent on agricultural production. Inland waters are of high importance in this area because Serbia itself is a country full of inland waterways – 588 km of the Danube, and 207 and 164 km of its tributaries the Sava and Tisza, respectively. If one adds the 600 km Danube-Tisza-Danube canal system, there's a

grand total of about 1,600 km of navigable waterway, available for diverting water for irrigation and for many other purposes.

Drainage of agricultural land in the Province is accomplished with built network of drainage canals of secondary and tertiary order, so-called detail drainage network. This network is mainly used during non-vegetation season (October-March) and for more than two decades there have been reconstruction works to bring parts of this network to another use – irrigation during vegetation season (April-September). Therefore, there are parts of this huge network that nowadays perform as two-fold purpose systems. Small villages and farmers are involved in operation of these canals in a way that they use water and Public Water Management Company Vode Vojvodine (Waters of Vojvodina) is providing technical means for secure distribution of required water for irrigation. Financial obligations, like taxes and fees are generally un-regulated and there are challenges in this regard to improve existing situation. One of possible strategic actions is creation of small water users associations and enabling them to be fully operational within proper legal, financial and technical framework, established in compliance with modern societal, political and economic environment.

Figure 1: Serbia and Vojvodina Province (northern part)

This figure shows Serbia and neighbouring counties and position of Vojvodina Province within Serbia

Srdjevic B. and Srdjevic Z. (2009, 2010) argue that the water users associations (WUAs) in Serbia and Vojvodina Province are already recognized as important mean in helping farmers to improve agricultural production and increase competitiveness at European markets, preserving that water management will be efficient, balanced and sustainable. To come-up to functional WUAs that would takeover control of irrigation and drainage infrastructure, there are preconditions such as: institutional reform, analysis of agronomic and socioeconomic drivers for WUA, and reconstruction of the existing drainage and irrigation canal networks. Following experience of countries with longer WUA tradition, it is understood that most important is to establish proper communication with farmers in attempt to change their thinking about

their individual problems and motivate them to take part in grouping around common problems. On-going research indicates that perspective action could be to create small pilot-association, demonstrate the concept and to alive enthusiasm of farmers, firstly in developed agricultural area such as the Vojvodina Province. This is because majority of farmers in Vojvodina already have clear understanding of importance to advance irrigation practice, and particularly of possibilities to exploit parts of huge Danube-Tisza-Danube hydro system for the two major purposes, drainage and irrigation, on switch on-off basis.

Research in the subject area undertaken so far is mainly focused on methodology and actions required to create pilot WUA, but also on multi-criteria decision-making instruments for manipulating processes related to establishing and operation of WUA. Focus is on resolving real-life problems encountered in farm business, improving efficiency in water use and adoption of new irrigation technologies, assessment of challenges and perspectives of swapping uses of the same canal networks (e.g. by reconstructing parts of drainage and irrigation infrastructure), using agro-technical and agro-chemical measures to increase food production, make it stable and safe for people and animals.

Organic agricultural production receives special attention and research is conducted from academic staff in this direction as well. One of direct outcomes is establishing new undergraduate course at the Faculty of Agriculture in Novi Sad (capital of the Province) and various improvements at all other educational levels (graduate, post graduate, training courses, workshops, etc.).

A PROCEDURE FOR LAUNCHING SMALL SCALE WATER USERS ASSOCIATION

Pre-Conditions To Forming Wuas

In majority of countries with organized systems for irrigation, state governments pay infrastructural costs – that is conveying water to the parcel. Investments at the parcel are allocated to the end user or that one who has ownership rights (individual farmer, state sector, private renter, etc.). If parcels are small and un-connected, investment costs are higher and more difficult is to preserve good water balance. Agricultural production in such circumstances will hardly be economically efficient and sustainable on long term basis. In addition, operational costs for dispersed properties can be extremely high. For obvious reasons, government has strong interest to stimulate aggregation of small-scale properties into larger ones, and also to enhance activities towards integration of involved agricultural producers into water users associations. Worthy to mention is that some earlier initiatives aimed to global agricultural associations in Serbia did not result in visible positive outcomes; rather it happened that following the initial enthusiastic phase, next steps were not properly defined to really stimulate farmers and other agricultural producers to get involved in further actions for benefit of all.

Recent research indicated the following set of essential pre-requisites to develop and install efficient WUAs in Serbia:

- Harmonization of national legislation and standards with legislation and directives established by the EU.
- Bringing into power strategic documents related to agricultural development within the global national legislation framework alignment with EU legislation; it is real to expect that such activities will create good legislative, economic and technical base to improve and expand irrigation in Serbia and enable high and stable agricultural production in all sectors and at levels of agricultural production.
- Continuing of initiated or on-going reconstructions of existing irrigation systems nation-wide.

- Applying law and regulations, as suggested by Hogson (2003), primarily in irrigation sector in global, then issuing required water quality certificates, contracting, collecting fees and in-field monitoring and inspection.

Besides necessary institutional reform, complex process of creating the WUA must be preceded by even more important work with interested people at local level, municipalities' majors and other relevant representatives. Continued education, overall increase of knowledge, training and enhancing motivation of farmers to become members of WUA and actively give expected input to it is considered as most important challenge and task.

At the moment there is no any water users association in Vojvodina Province or in other parts of Serbia. There is identified need to create at least 4-5 associations. Any action in this direction should generate added value by producing technically sound farmers who can address problems by applying good agricultural practices, especially with regard to irrigation, and join efforts in creating water users association at larger scale(s). It is particularly important for Vojvodina Province because the concept of organized work of farmers to resolve common problems would promote new paradigm and increase of agricultural safe food production, essential for the Serbian national economy.

Challenges To Forming Wuas

Legal, financial and organizational challenges in establishing water users associations in Vojvodina and expected direct outcomes in this regard are as follows:

- It is urgent matter to define scientifically sound methodology and establish the first Water Users Association (WUA) in Vojvodina. Target group should count 100-200 small and medium farmers. Organized motivation sessions with farmers would enable explaining opportunities and benefits of having WUA, presenting experience from other neighbor countries (Hungary, Romania, Croatia, FYROM, and Bulgaria) (see Hussain and Zeeshan, 2007).
- Analysis of best practices in agricultural and related water sector of EU such as: trading and services related to agricultural products, mechanisms for renting irrigation equipment, crediting farmers for getting loans from banks, etc.
- Developing participative decision-making model, robust to challenges that may arise during the WUA creation, and especially its implementation. Questions to be answered are: How to organize decision-making process? Who defines a problem and who is modeling it? What are the levels of making decisions (responsibilities)? Which methods will support decision-making? How decision will be implemented? Who is responsible and what are the consequences for failing to implement decision? How to recognize wrong decision-making and/or undesired decision outcome(s)?
- Opportunities to combine Multi-criteria Decision-making (MCDM) methods and Social Choice Theory (SCT) methods and methodologies should be assessed to enable better decision making in WUA.
- Certain number of Serbian farmers should participate in preparatory activities related to forming the first WUA. Their real-life knowledge and different inputs should enable simulating of possible realistic scenarios of WUA implementation and functioning. In this way they should help bridging of existing gap between science (academic) and field practice (farmers).

DECISION-MAKING WITHIN WUA: AN EXAMPLE

There are many important issues related to the decision-making processes within any WUA. Organization and internal structure of the WUA, normative documents, involved administrative personnel and water users (dominantly small and medium properties of farmers, say 5-30 hectares) are core part of the WUA. However, there are other interests and impacts such as those related to political influences, acting of NGOs' representatives, involvement of 'in-situ municipalities', inspection services, or advisory role of independent (mainly academic) experts. Depending on adopted organizational scheme and established statutory rights and obligations, the decision process at various stages can be organized in different ways. Essential is how to assure fair process and reduce negative manipulation of important information and data, motivate decision-makers or their interest groups to competently participate in creating the process and deriving valuable final decision(s). Here we discuss one possible scenario of implementing specific decision-making tools that can provide competent statement and assessment of a decision problem in the WUA, enable evaluation of decision elements (criteria and alternatives sets), and assure deriving the final group decision based on aggregation of individual decisions 'delegated' by various interest groups within and without WUA.

Statement Of The Decision-Making Problem

The Water Committee (WC) of the Water Users Association has to select one of 5 offered alternatives for in exploitation of existing canal network for its two-fold use (existing drainage and future irrigation) in small sub-basin with an area of 750 hectares. Alternatives are all well technically documented with detail description of organizational and financial issues, estimated risks regarding quantity and quality of supplied water to the registered users along canals, anticipated environmental impacts and expected agricultural production for market and households.

Technical control and operation of canals and related equipment (e.g. lockers and pumps) are of special concern, along with a structure and dynamics of additional initial financing required for changing existing drainage function of canals into an (additional) irrigation function during vegetation season (April-September). In addition, each alternative is documented in regard to required measures and financial inputs for investments and on demand re-investments, rules and procedures for collecting taxes and fees from the users of canal network, opportunities for users to get loans for irrigation equipment and other important agricultural inputs such as seeds, fertilizers and pesticides, and finally perspectives for obtaining subsidies to motivate farmers to participate in irrigation development program nationwide.

According to internal statute of the WC, in part of making decisions, for evaluation of alternatives and selection of the best one, scientifically recognized multi-criteria model of decision-making has to be applied. Criteria set has to be agreed in advance, e.g. as a consensus outcome of a discussion, brainstorming or internal communication between different interest groups.

The AHP And Borda Count Methods

The Analytic hierarch process (AHP) developed by Saaty (1980) is a complete methodology for solving hierarchically structured decision problems. It elicits the decision maker's (DM) judgment of elements in a hierarchy and mathematically manipulates them to obtain the final preference weights of the decision alternatives with respect to the overall goal. In the most general case, the criteria are first judged with respect to the overall goal and then used as 'local goals' for eliciting the DM's judgment of the alternatives. The AHP is widely used for supporting individual and group decision-making. Worthy to mention are some more recent investigations concerned with integrating the independent stages of group synthesis and prioritization in AHP into the unique process by methods such as goal programming, or fuzzy preference programming.

If the SC methodology is selected as being more favorable in group decision-making, several approaches have been proposed for aggregating voters' responses into a compromise ranking. Nurmi (1987) made comparison of well-known election methods as plurality voting, the Hare system, the Borda count, pair wise comparisons voting and approval voting; these methods are all briefly and mathematically described in Srdjevic (2007). All methods except the last are considered preferential methods based on ordinal preferences of candidates that are voted for. Voting methods serve as support in searches for collective choice, and many authors in the SC literature have suggested when and how to use them to find the best decision under conflicting preferences of the decision makers or interest groups. In the Borda count method which is used here, each alternative gets 1 point for each first place vote received, 2 points for each next-to-first point vote, etc., all the way down to N points for each last place vote (where N is the number of alternatives). The alternative with the lowest point total wins the election and is declared to be the social choice. The Borda count uses all the preference information in the preference schedule which is a powerful theoretical argument over the plurality voting and the Hare system. However, it should be noted that the Borda count is susceptible to strategic manipulation.

Rules And Methodology Of Making Decisions

Firstly, criteria sets are defined by each interest group (IG) separately according to its own interests; however, reasonable assumption is that given IG will anticipate that forthcoming 'negotiation' process with the other IGs requires awareness about not only own but broader interests of community and different priorities of other IGs.

Srdjevic Z and Srdjevic B (2007) suggested that WC should work in plenary, while multi criteria analysis and decision-making should be conducted in decentralized manner, in parallel IGs' sessions. By assumption, given IG can autonomously select a decision-making tool such as AHP, PROMETHEE or ELECTRE, although simpler methods can be applied such as brainstorming or internal communication as simulation of consensus based decision-making.

In this illustrative example, each IG uses the AHP to evaluate the same set of 5 alternatives, provides a list of relative weights of alternatives, and all 9 lists are forwarded to the WC where they are collected into the preference Table 1.

Table 1: Alternatives' Weights by Interest Groups

Interest groups		Alternatives				
		#1	#2	#3	#4	#5
IG1	Existing users	0.18	0.42	0.11	0.23	0.06
IG2	New users	0.10	0.24	0.21	0.31	0.14
IG3	Public Water Management Co. Vode Vojvodine	0.28	0.17	0.05	0.16	0.34
IG4	Water Company Srednji Banat	0.14	0.21	0.41	0.08	0.16
IG5	Municipality Topolovac	0.13	0.26	0.11	0.29	0.21
IG6	Province Secr. for Agriculture, Forestry and Water Management	0.15	0.17	0.23	0.25	0.20
IG7	University (independent experts)	0.27	0.11	0.08	0.18	0.36
IG8	Inspection	0.21	0.26	0.38	0.08	0.07
IG9	NGO (Ecology Movement)	0.35	0.11	0.13	0.17	0.24

Table presents results of the evaluation of alternatives by 9 user groups.

By using ranks instead of weights given in Table 1, and by applying Borda count method, preference elective method from the Social Choice Theory, the final ranking of alternatives is obtained as given in Table 2. The best is Alternative #4 indicated 3 times as the first (by IG2, IG5 and IG6), once as the second (IG1), and twice as the third (IG7 and IG8). This alternative is ranked as the worst one just once, similar to Alternative #2. Worthy to mention is that 9 'delegated lists' are treated as of equal importance.

Table 2: Borda Count Ranking of Alternatives

Interest groups		Alternatives				
		#1	#2	#3	#4	#5
IG1	Existing users	3	1	4	2	5
IG2	New users	5	2	3	1	4
IG3	Public Water Management Co. Vode Vojvodine	2	3	5	4	1
IG4	Water Company Srednji Banat	4	2	1	5	3
IG5	Municipality Topolovac	4	2	5	1	3
IG6	Province Secr. for Agriculture, Forestry and Water Management	5	4	2	1	3
IG7	University (independent experts)	2	4	5	3	1
IG8	Inspection	3	2	1	4	5
IG9	NGO (Ecology Movement)	1	5	4	3	2
	Sum of ranks	29	27	30	24	27
	Ranking	(4)	(2-3)	(5)	(1)	(2-3)

Final ranking of alternatives obtained using the Borda Count is presented, assuming that all IGs are of equal importance.

The other used method to derive common decision at the WC level exploits cardinal information from the Table 1 is the Geometric Mean Method (GMM):

$$z_i^G = \prod_{k=1}^K [z_i(k)]^{\alpha_k} \quad (1)$$

where $z_i(k)$ is entry in Table 1, i relates to indexing of alternatives, k relates to indexing of interest groups, z_i^G is the final weight of alternative as a group weight, and α_k is a relative weight associated to interest group k .

Table 3: Aggregating Alternatives' 'Performance' for Two Weighting Schemes

Interest groups		Alternatives				
		#1	#2	#3	#4	#5
Weighting scheme A	GMM	0.19	0.27	0.21	0.19	0.14
	Ranking	(3-4)	(1)	(2)	(3-4)	(5)
Weighting scheme B	GMM	0.20	0.21	0.16	0.23	0.20
	Ranking	(3-4)	(2)	(5)	(1)	(3-4)

Table shows ranking of alternatives if weighting of interests groups is applied.

Different weighting of interest groups may produce different final ranking of alternatives. First example is adoption of the weighting scheme A in which existing users (IG1) are dominant (weight is 0.22), followed by future users (IG2), Water Company Srednji Banat (IG4) and Inspection (IG8) (all three with weights equal to 0.17), and by remaining other participants being four times 'less important' (weight 0.06). In this case, the Alternative #2 is most preferred from the group (WC) standpoint, and Alternative #3 is the second best.

Second example is the weighting scheme B in which Province Secretariat for Water Management, Agriculture and Forestry (IG6) receives very large weight (0.46), interest groups IG3 and IG1 have smaller weights (respectively 0.17 and 0.14), even jointly smaller than weight of IG1, and the remaining interest groups have symbolic small weights (ranging between 0.03 and 0.09). With scheme B, the best is Alternative #4, and Alternative #2 is moved to the second place. Etc.

The results obtained by the two different methods of aggregation, Borda count (Table 2), and GMM (Table 3) show that the decision process can be manipulated in different ways, both at the method selection level and (if GMM is used) prioritizing decision makers level. In the later case weights of IGs are changed to illustrate that the final outcome can be favorized if political influence is prevailing.

CONCLUSIONS

Water users associations (WUA), as an organizational form, in many countries represent trustful concept well merged into the legal societal framework. There is no unique WUA model neither in terminology or legislation behind it, but base principles are the same. In most cases WUA is democratically controlled, established by their members and with similar internal structure. Most often they are non-profit entities. Regarding legislation, selected rights are delegated to the WUA's members, enabling thus that WUA is capable to promote democracy and transparency and to assure fulfilling of individual member's rights. In other words, rules are most commonly established in such a way that equity between ordinary and reach members of the association are promoted in positive way.

An economic system transformation (socialism to capitalism) and related privatization processes in Vojvodina Province in Serbia are underway, which means that ownership structure is permanently changed in many instances. State owned properties are sold by tenders to private individual owners or their interest associations. Large agricultural areas have been already privatized, while water bodies (rivers, canals, and lakes with related infrastructure which includes lockers, pumping facilities etc.) are public property and controlled by the state. There are thousands of small and medium size farms (5-30 ha) along Vojvodina's rivers and canals and all this is important background for better understanding of pre-conditions to forming water users associations in the Province.

Actual Serbian legislative actions are in line with European Water Framework Directive (WFD) which states that river basin level agreements are institutional prerequisite for better water management (e.g. erecting an institutionalized framework for basin cooperation, including a highly competent secretariat, or water users associations); that international laws should be acknowledged; that certain environmental safeguards must be established; that a major ambition to further develop basin cooperation is clearly exposed as well as willingness to share information for benefit of all.

In establishing WUAs in Vojvodina it was concluded through recent research that positively aggressive dissemination and promotion campaign may convince policy makers that increasing interest of small and medium farmers for having effective water users associations is reality which requires prompt and effective response. However, organized action at provincial level is till missing to resolve important issues related to forming water users associations such as:

- motivating individual agricultural producers (e.g. farmers) to participate in vital actions and decision-making concerning irrigation developments, and in line with this restructuring parts of drainage canals infrastructure to perform irrigation when agricultural land is experiencing deficits in water supply;
- improving global organization of irrigation sector;
- identifying real sources, instruments and dynamics of financing short-term and long-term technical solutions;
- active involvement for water resources responsible institutions (e.g. Public Water Management Co. Vode Vojvodine), and state institutions (e.g. ministries, secretariats, directorates and inspection) to urgently enable forming firstly small and later on bigger water users associations that will gather small individual farmers and (if any) their associations, renters of irrigation equipment etc.

Once these goals and tasks are achieved, legal, financial and organizational framework for establishing water users associations in Vojvodina will be satisfactorily created to enable implementation of scientifically based decision-making methodologies and tools described in this paper.

OPPORTUNITY IDENTIFICATION AND IDEA GENERATION IN NEW SERVICE DEVELOPMENT

Payam Vaseghi, John Molson School of Business, Concordia University
Alessandra Boezio, John Molson School of Business, Concordia University

ABSTRACT

The literature available on the subject of New Product Development (NPD) is extensive, yet publications regarding its counterpart, New Service Development (NSD) are not nearly as prominent. It is of the upmost importance that new services and their development be explored. Not only are services accounting for a greater portion of GDP, many manufacturing companies are offering services as a value added element to their products. The purpose of this study is to delve into the field of New Service Development and study the factors that contribute to its success. More specifically, the front end activities of the NSD, opportunity identification and idea generation, have been the target of this study. This fuzzy front end stage is the starting point of any successful product or service. Consequently, the factors influencing the success of this stage in New Service Development will be identified. In this study three major sources of new service ideas have been indicated: Customer Involvement, Frontline Employees and Entrepreneurs or Project Champions. Three elements of needs and wants, experience, and knowledge are orderly, the sources of the new ideas in those three participants: customers, frontline employees and service champions. The proposed conceptual model shows that the presence and collaboration of all three factors, in the opportunity identification and idea generation stage, will result successful service innovations.

KEYWORDS: New service development, Idea generation, Sources of ideas, NSD success

INTRODUCTION

The purpose of this study is to delve into the field of New Service Development and study the factors that contribute to its success. New Service Development, like New Product Development, is a very broad area of study. As a result, only a specific stage in the New Service Development process will be addressed: Opportunity Identification and Idea Generation. This stage is the starting point of any successful product or service. Consequently, the factors influencing the success of this stage in New Service Development will be identified. These factors are Customer Involvement, Frontline Employees and Entrepreneurs or Project Champions. Although, these factors are influential for both products and services, they are far more important for services. The proposed conceptual model will show that the presence and collaboration of all three factors, in the opportunity identification and idea generation stage, will result in successful service innovations.

LITERATURE REVIEW

New Service Development Vs. New Product Development

The literature available on the subject of New Product Development (NPD) is extensive, yet publications regarding its counterpart, New Service Development (NSD) are not nearly as prominent. Although, research into this latter field has been on the rise since the 1980's there are still many opportunities for further studies. Furthermore, it is of the upmost importance that new services and their development be explored. Not only are services accounting for a greater portion of GDP, many manufacturing companies are offering services as a value added element to their products. As an example, companies specializing primarily in products, add services to their product line as an incremental innovation to the product (i.e.

Apple offering automatic transfer of files, for people who want to switch from a P.C to a Mac) (Bitran et al. 1998).

Figure 1: % of total GDP of manufacturing and service sectors for U.K. (Oke, 2007)

Figure 1 represents the percentage of the total GDP for the manufacturing and service sectors in the U.K. As can be seen in the graph, the manufacturing industry is slowly declining, while the service industry is increasing (Oke 2007). Given the trends that are happening in the current business market, it is important that academic research contribute to the study of this change in the market.

The disproportionate amount of research between NPD and NSD is rooted in the managerial belief that NSD does not proceed through the same official process that NPD does. Much of the early literature on the subject was dedicated to proving the need for a formal NSD model. Before NSD and its specifics can be discussed, it is important to understand the factors that distinguish services from manufactured goods: intangibility, inseparability of production and consumption, variability, and perishability of the service offerings. A service is intangible because it cannot be held or physically seen, and it is inseparable because services are produced when they are consumed. A service is considered to have variability because there is no way to standardize services when human resources are involved, since humans themselves are not capable of standardizing their behaviour. Furthermore, a service is considered to be perishable because it is consumed when it is produced (Zeithaml et al., 1985, de Brentani 1990).

New Service Success Factors And The Formal NSD Process

de Brentani (1990) outlines what factors companies must consider when trying to achieve new service success. Among others, de Brentani points out that proficiency in NSD is important, more specifically, a strong detailed/formal New Service Development (NSD) process. Projects that emphasize this point require certain up front activities like market studies and customer researched concept descriptions. These activities make up the opportunity identification and idea generation stages similar to those found in New Product Development. The author further elaborates on other success factors that are relevant to this stage. One such factor is 'Market Characteristics', these characteristics describe the market for the new services and include market competitiveness, product-market fit or attractiveness, specialized initial

market and response to market demand. Overall, a service firm that considers the above characteristics is engaging in opportunity identification stages. It is important to note that the opportunity identification and the idea generation stage is the first stage that sets the foundation for whatever the new product or service will be. It is imperative that this stage be well thought out and developed (Urban et al., 1993).

Up-front market research (opportunity and idea generation stage) is extremely important to recognize the wants and problems of customers. In addition to uncovering these wants and needs, effective market research aids in determining how these wants and needs can be served in new service design. Knowledge of the target customers is especially important for services because they are intangible and often complex. Since they are consumed on delivery, they need to be continually sold to customers. New services cannot just solve a given problem; the benefits of the new service need be understood by the customers if they are going to perceive it more favourable than that of the competition (De Brentani & Ragot, 1996).

Furthermore, de Brentani (2000) discusses global success factors that would lead to successful NSD.

Success of new service ventures tend to include a solid customer and/or need fit, which takes place in the opportunity identification step of New Product Development. The reason for this is rooted in the theory that understanding the needs of the customer is important in the success or failure of that service. For example, with similar commodity services there is little incentive for business clients to change service providers, as it can be costly to recreate relationships that match specific systems. To succeed a firm needs to get an in depth understanding and appreciation of customers' operations, systems and needs, all of which take place in the opportunity identification stage. Once this stage is complete, the firm can focus on differentiating this new service from its competitors through branding.

The greater the intangible component of a product or service the more difficult it is to understand what customers want, why they want it, and how to deliver it (Bitran et al., 1998). NSD research has shown that a service's success begins in the opportunity identification and idea generation stage; however, it is important to consider what factors are taken into account at this stage. Throughout the literature, three factors have been proven to aid in the development of ideas for services: Customer Involvement, Frontline Employees and Entrepreneurs or Project Champions.

Customer Involvement

The first and most important source of ideas in service segments are customers, as the service is going to be designed to satisfy their needs and wants. Many studies in New Service Development have found customer interaction and involvement as a significant indicator of success in service sectors (de Brentani & Cooper, 1992; Martin & Horne, 1993; de Brentani, 1991, 1995; de Brentani & Ragot, 1996). According to Alam (2002), market synergy and understanding customers needs is a stronger success factor for services than for tangible products, consequently, user involvement may be more important for service innovation than for physical goods innovation. Similarly, de Brentani (1995) indicates that intangibility of services represents a challenge for marketers of new services which leads to the need for closer interaction with customers, as compared to the New Product Development process.

Customer involvement can bring many advantages to the service firms. Firstly, it can lead to further differentiation between services, and an improvement in their quality. The variability feature of services can either be an advantage or disadvantage. On one hand, variability makes consistency and predictability of the expected service difficult; on the other hand, it can increase customization, and develop unique, differentiated high-value services by involving customers in NSD process (de Brentani, 1995).

Secondly, Customer involvement can reduce cycle time by generating new ideas with high levels of perceived value, directly from customers (Alam, 2002). Not only does customer involvement reveal customers' needs, wants and preferences, it also provides some indication as to how to deliver the service.

From the quality perspective, customer involvement is necessary because customers interpret the value and quality of the service based on preconceived expectations of what the service should be like (Parasurama et al., 1985). Furthermore, it has been found that customer involvement enhances the responsiveness and empathy dimensions of service quality. Studies show that value-added and customer-friendly services emerge from a dialogue with competent and demanding customers (Edvardsson & Olsson, 1996). By involving customers in NSD, the firm shows its willingness to help the customer and provide prompt, improved service (responsiveness). The firm also shows a willingness to provide individualized attention to its customers (empathy) (Kotler et al., 2009). This issue is becoming increasingly important for business-to-business service providers, for whom customer participation has a significant and substantial impact on maintaining long-term relationships with customers (de Brentani & Ragot, 1996). Additionally, as indicated by Alam (2002), customer involvement improves public long-term relationships by building customer loyalty and communication over time.

Finally, customer involvement leads to rapid development and diffusion, which is valuable for highly technological firms, who develop innovative services. For these firms, customer involvement speeds up the development process, by providing the required input (Carbonell et al., 2009), and market acceptance, by educating users about attributes and benefits of the new service (Alam, 2002).

More specifically, customers play a critical role in the early stages of new service development, often called fuzzy front-end, due to an involving imprecise process and ad hoc decisions (Alam, 2006). The author explains that the front stages of NSD – as in NPD – are the most information intensive; customers can be very useful at this point and can reduce the fuzziness of fuzzy-front-end of NSD. Ottenbacher and Harrington (2010) indicated that firms must understand customer needs and wants, as well as respond quickly to market changes in a fashion that is superior to competitors' in meeting these consumer needs. This market responsiveness feature of successful new service developers highlights the importance of customer involvement in the early stage of NSD (Ottenbacher and Harrington, 2010).

Consistently, Alam (2002) demonstrates that user involvement is of greater importance, and more intense in the idea generation stage to get the fundamental service concept right before extensive resources allocation. According to Magnusson, et al. (2003) customer-generated new service ideas have higher user value than those generated solely by internal product/service development staff, and can be as good as or better than ideas produced by professional service designers. Customer involvement in the idea generation stage will enhance service marketability by helping the firm to better anticipate and respond to expressed and latent customer needs. This is true, even if these prospective customers cannot articulate their needs, interests, or problems, they may still be able to recognize the value of new service ideas when the ideas are presented and explained (Ardichvili et al., 2003). Overall, the invaluable benefits of customer involvement in the opportunity identification and idea generation stages have been noted in many studies, and countless researchers.

Frontline Employees

Frontline employees can be defined as those workers that have direct contact with the customers. As they work so closely with customers, frontline employees are another valuable source of ideas, especially in services, for how to best meet customer needs, and provide insight into how to best implement new service strategies. Several techniques, such as empowerment, training and behaviour-based evaluation of frontline employees have been found to be important success factors of NSD, which indicate the critical role they play in this process (Ottenbacher & Harrington, 2010).

Firstly, one reason that frontline employees play a greater role in NSD than NPD is that there is much more customer-employee interaction in the sale of services than the sale of products. Secondly, frontline employees are in direct contact with customers and are generally the receivers of customer complaints

and suggestions; allowing them to best convey customers needs and wants. Finally, the ‘inseparability’ nature of services between production and consumption causes the frontline employees to witness both the ends of the service production and consumption. Consequently, they can better identify the gaps and shortcomings in the service, and would be vital in the generation of new and innovative ideas. Schneider and Bowen (1984) argue that frontline employees are not only a valuable source of new service ideas but they can be even more useful when it comes to implementing a new service and eliciting the desired customer response. In addition, Bowers (1989) urges service firms to use contact personnel as a precious internal source of new ideas, because after customers themselves, these employees are most familiar with customer needs.

Regarding service quality dimensions, new service ideas generated by frontline employees can provide good levels of responsiveness, reliability and assurance. To begin, as these ideas are generated to satisfy an observed gap in service consumption there is high level of responsiveness. Moreover, as these ideas are bubbled up from the frontline - employees who are the deliverer of the services - there is high level of reliability and assurance that the ideas can be delivered accurately and dependably (reliability) and employees have the required knowledge and courtesy to deliver to the service (assurance) (Kotler et al., 2009). Additionally, Martin and Horne (1993) discuss that ideas for many high-quality services come from the bottom layers of the organization which has direct contact with customers and are exposed to the consumption of the services.

Organizational behaviour theory states that involving employees in decision making, as well as using their ideas for important firm decisions, such as NSD, increases the autonomy of the employees in the work environment. Based on Self Determination Theory (SDT), this increased autonomy in work place will lead to increased intrinsic and/or identified extrinsic motivation. Subsequently, these types of motivations result in increased creativity and heuristic problem solving in employees (Gagne & Deci, 2005). Thus, hearing ideas by frontline employees will eventually lead to higher-quality ideas and a more rewarding idea generation process. Additionally, Schneider and Bowen (1984) contend that frontline employee involvement in NSD improves the quality of services in two ways. First, it helps firms to avoid insensitivity to customers and sets the most appropriate style and pace of new service delivery; and secondly, it helps prevent financial goals of the firm from overwhelming the objective of meeting customer needs in the new service.

Entrepreneurs/ New Service Champions

The third important element in opportunity identification and idea generation stage would be entrepreneurs and new service champions. Entrepreneurship is defined as the promotion of innovation in an uncertain environment (Coakes & Smith, 2007). Identifying and selecting the right opportunities for new businesses are among the most important abilities of a successful entrepreneur (Ardichvili et al., 2003). Special characteristics of entrepreneurs equip them to identify the new ideas and opportunities. These characteristics includes high level of alertness, knowledge and experience, strong social networks inside and outside of the company and high level of creativity, optimism, and need for achievement (Ardichvili et al., 2003). While the term “entrepreneur” is mostly used for new small to medium enterprises, project champions were found to be the equivalent of entrepreneurs in large well-established companies.

Collins and Moore (1964) found very strong similarities between traditional and independent entrepreneurs and new product champions. In fact, champions are seen as natural entrepreneurs and transformational leaders who play a key role in new service and product development (Coakes & Smith, 2007). Champions are individuals who create and define the idea or informally emerge to promote it with conviction, persistence and energy; they would willingly risk their position and reputation to ensure the innovation’s success (Maidique, 1980). Schon (1963) indicates that ordinary involvement with a new idea cannot provide the energy required to cope with resistance and indifference that major technical changes provoke, and each new idea either finds a champion or dies.

Howell (2005) found that 90 percent of raw ideas never go beyond the idea-generator's desk and only 3 per cent of the remaining 10 per cent obtained sufficient backing to become projects with less than 1 per cent commercially launched. The reason for the high failure rate of new ideas is the absence of a champion who guides the idea through conception, definition and initial testing. Champions are widely acknowledged as pivotal to innovation speed and success, as they provide enthusiastic support for creative ideas by generating/recognizing new ideas and sheltering them from premature dismissal (Howell, 2005). Effective champions are distinguished by three behaviors: "conveying confidence and enthusiasm about the innovation; enlisting the support and involvement of key stakeholders; and persisting in the face of adversity" (Howell, 2005, P.108). Just like entrepreneurs, innovation champions have extensive social networks in place. The challenge for the organization and those charged with entrepreneurship is to transform those networks into communities of innovation. Howell and Higgins (1990) argue that without champions organizations may have a lot of ideas but few tangible innovations, however the mere presence of these employees in the work place is not enough and they should to be encouraged and motivated by management. Overall, according to the literature, it is important to note that innovation champions are unique people, with a particular personality type and psychological profile, and if they are provided with the procedural, social and cognitive support they need they can boost new service development significantly.

Martin Jr. et al. (1993) found that firms were more successful when their innovative service had a close fit to services already offered by the firm. This is due to the fact that services are far more successful when the firms are aware of what their customers want and how to provide it to them. From the evidence provided above, it can be seen that the three factors: customer involvement, frontline employees and entrepreneurs or project champions, greatly contribute to the overall firm knowledge and ultimately its success.

THEORETICAL FRAMEWORK

The proposed conceptual model suggests that the presence and use of all three factors: customer involvement, frontline employees and entrepreneurs or project champions, will lead firms to maximize their New Service Development and achieve a successful service idea. All three factors contribute to an effective opportunity identification and idea generation.

It has been shown that each of these individual factors contributes to success; What this paper propose that is the fact that the use and implementation of all three together makes a significant difference in success when compared to scenarios when not all three are considered (Martin Jr. et al, 1993). It is important to note that for smaller companies, the entrepreneurs contributed the knowledge, may also be the experienced front line employees.

PROPOSITIONS

Based on literature and aforementioned discussion we propose that firms will have new service development success when customers, front line employees and entrepreneurs/product champions, are involved in the opportunity identification and idea generation process.

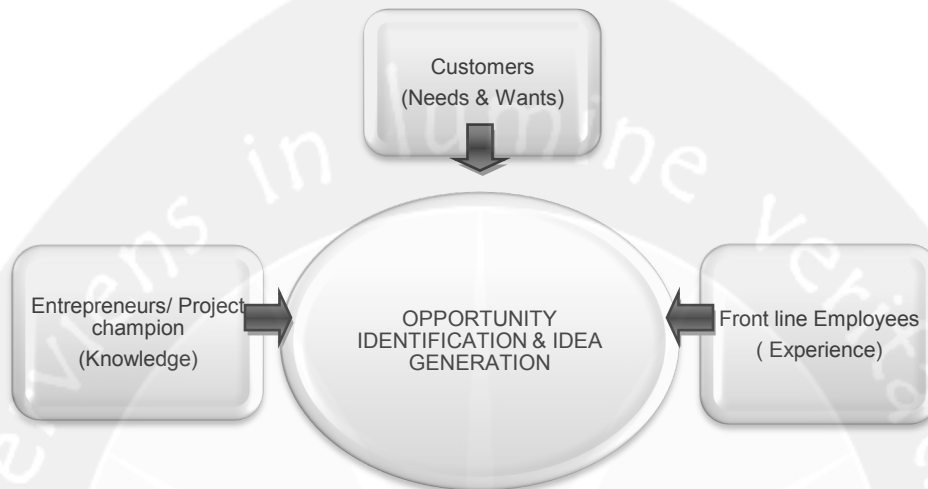

P1: Customers Involvement in the opportunity identification and idea generation stage will result in a successful new service.

P2: Front Line employee involvement in the opportunity identification and idea generation stage will result in a successful new service.

P3: Entrepreneurs/ Project Champions involvement in the opportunity identification and idea generation stage will result in a successful new service.

P4: The combination of all three factors: Customer Involvement, Front Line employees and Entrepreneurs/ Project Champions involvement in the opportunity identification and idea generation stage will result in a successful new service.

Figure 1: Conceptual Model depicting the factors that should be present in the Opportunity Identification and Idea Generation Stage

CONCLUSION

In this study three major sources of new service ideas have been indicated: Customer Involvement, Frontline Employees and Entrepreneurs or Project Champions. Three elements of needs and wants, experience, and knowledge are orderly, the sources of the new ideas in those three participants: customers, frontline employees and service champions. The proposed conceptual model shows that the presence and collaboration of all three factors, in the opportunity identification and idea generation stage, will result successful service innovations. Literature has shown the importance for companies to have Product Innovation Charters; furthermore, literature has also shown the willingness for companies to implement these types of product charters but this is not yet the case for service development (Crawford, 1980). Significant results from research of this nature can entice managers to accept a formal new service innovation charter that would contribute to the firms' overall success. More specifically, this research would also provide managers with a better understanding of the importance of the opportunity and idea generation stage. Significant results will show companies that cross-functional collaboration is not only important in product innovation but is also of the essence in service innovation.

As was previously mentioned, there is a disproportionate amount of research between NPD and NSD; as a result, there are many opportunities to further the research proposed. As is the case with NPD, every stage of the NSD contributes something important to the success of a service. Consequently, there are many gaps across the other stages that would need to be studied. In addition, as with NPD, the approach to incremental services and breakthrough services varies greatly, these differences can be studied at the opportunity identification and idea generation stage, or they can be studied at any other stage of the NSD process (de Brentani, 2001).

CONSUMER (STUDENT) PERCEPTION OF QUALITY TEACHING AND LEARNING IN THE BUSINESS SCHOOLS (HND) OF POLYTECHNIC INSTITUTIONS IN GHANA

Solomon Abekah Keelson, Takoradi Polytechnic, Ghana

ABSTRACT

The study is conducted to examine students' perceptions of the effectiveness of teaching and learning in business studies programs in the polytechnic institutions in Ghana. This research is a replica study (Hamid and Pihie, 2004). Two major factors are employed to measure students' perceptions of effective teaching and learning. They are Lecturers' Characteristics and Teaching Methodology. Findings of the study are aimed at showing how respondents perceive the qualities possessed and exhibited by lecturers as per the two main constructs. The SPSS (version 17) is the statistical package for this study, where descriptive statistics was used the research. F ratio and ANOVA were used to show the significant differences in students' perceptions of all two factors based on their age, class, and department. There was measurement of significant differences in the perceptions of overall Lecturer Characteristics, and in the perceptions of Teaching Methodology based on these variables. The study revealed a high students' perception of the quality of teaching and learning in the Polytechnics in Ghana. The significance differences found in the perception of few variables of Lecturers' Factors and Teaching Methodology were related to age, class and departments

KEY WORDS: Polytechnic, Lecture characteristics, Teaching methodology, Quality teaching, Consumer

INTRODUCTION

Quality teaching and learning in this study is drawn from the larger discipline of Service Quality (Parasuraman et al., 1985). They identified ten factors that determine service quality. They are: Reliability, Responsiveness, Competence, Access, Courtesy, Communication, Credibility, Security, Understanding and knowing the Customer, and Tangibles such as Facilities and Equipment. A later study by Wright (1996) identified eight major determinants of service quality for higher education. These include diversity of educational experience (diversity of coursework and student body), access and use of facilities (location, atmosphere and hours of university facilities), personalized interaction (interaction between student and faculty), student quality (quality of students at the polytechnic), educational process (requirements and ability to fulfill requirements), faculty quality (academic and professional background of faculty), and lecturer's years of teaching experience.

The works of Parasuraman et al. (1985) and Wright (1996) consider quality in a far broader perspective. The focus of quality teaching and learning in this study is on the dimensional factors that directly influence the process delivery of instructional design and the course outcomes. Quality teaching in polytechnic should be one that is able to equip students into an in-depth and comprehensive approach to the subject matter. This would require an active, durable, and critical construction of knowledge integrated with the student's previous knowledge and be able to put what is learned to action (Entwistle and Ramsden 1987). According to Pennington and O'Neil (1994) teaching should be effective if it is based on the following important principles: (1) enhancing students' general capabilities and work-related skills (2) using student experience as a learning resource (3) encouraging active and co-operative learning (4) promoting responsibility in learning (5) engaging with feelings, values and motives (the affective domain) as well as with intellectual development (6) fostering open, flexible, reflexive and outcome -

based assessment (7)evaluating teaching and learning to encourage reflective teaching, and (8) developing organization-wide strategies to establish congruence of policies to enhance physical and material learning environment.

Students' perceptions of quality learning is found to include experiences that helped them to link theory with the real world, assignments relevant to real work place, discussions leading to new perspectives of thinking, and curriculum that took account of the students' group experiences and imparted added value to students (Hill et al., 2003). Customer satisfaction in higher education is found to be measured primarily by the expectations created upon the service by various parties to be delivered to or experienced by the customer – who in this context is the student (Hamid and Pihie, 2004). One such expectation is the quality of the teaching staff. In their study of quality teaching in US universities, Lammers and Murphy (2002) posited lecturers' enthusiasm, knowledge ability in the subject, and effective classroom management as highly valued skills which interact with other physical factors such as course design to produce effective teaching and learning. Earlier study on lecturer traits indicated that students valued responsiveness and trustworthiness as the major traits (Morton-Cooper, 1993). Trustworthiness included the element of reliability and consistency. Lecturer enthusiasm was also a vital trait that encouraged learning (O'Neil, 1995; Ramsden, 1988; Hill et al. 2003).

The study by Rowley (1997) looked at service quality with regards to the impact of external expectations from other stakeholders such as employers, governmental policy making agencies, parents, and subsequent training and learning institutions on the standards of service delivery and service outcomes. However, this study limits the focus on factors that are immediately within the control of the Lecturers. These factors are the Lecturer Characteristics and Teaching Methodology employed. Course Relevance and Design are not considered in this study because within the Ghanaian context, it is not within the immediate control of the lecturer. The Design of the Course is in the hands of the educational authorities. The evaluators are the students who are the main service recipients. The outcome of the study should therefore contribute in more immediate and specific ways to the school of business in particular and the polytechnic institutions in general. It should also serve as a management tool for managers of the polytechnics and a useful document for policy markers of education, especially, higher education.

THE RESEARCH PROBLEM

As part of the Ghana Educational Reforms which began in the late 1980s, Polytechnics were upgraded by the Polytechnic Law 1992 (PNDCL 321, 1992) to become part of the Ghana Tertiary Education System. The Polytechnics began to offer Higher National Diploma (HND) programmes in the 1992/93 academic year. These reforms mandated the Polytechnics to complement the role of the Universities to increase access to tertiary education by training middle level manpower for the country's needs. For the last two decades, HND programmes in the Polytechnic education have contributed significantly to the development process of the country. The field of business has particularly contributed immensely through the training of Accountancy, Marketing, Purchasing and Supply, and Management and Secretaryship personnel. The continued training of the middle-level business professionals is very crucial to the success of business management.

Thus, quality assurance in the teaching and learning is critical for the Polytechnic to partner with industry to improve the training of business professionals. The study thus focuses on the current state of polytechnic education in Ghana in relation to the teaching and learning in the business faculties as perceived by the end-user, the student.

THE RESEARCH OBJECTIVES

The objectives of the study are as follows:

1. To identify students' overall perceptions of the quality teaching and learning factors in the business studies programs in Ghanaian Polytechnics;
2. To identify students' perceptions of Lecturer Characteristics and Teaching Methodology
3. To examine the relationship, if any between students' overall perception of quality of teaching and learning factors in the business studies program and their demographic variables; and
4. To examine the significant differences in students' perceptions of Lecturer Characteristics and Teaching Methodology of their Course based on their demographic variables.

RESEARCH DESIGN

This exploratory study used both primary and secondary sources of information with a quantitative research instrument. The study employed Lecturer characteristics and Teaching methodology to measure the quality of teaching and learning. This is because these factors were assumed to be directly under the influence of the Faculty and lecturers. The Lecturer characteristics consisted of 4 constructs that were Teaching Skills, Fairness, Firmness; Helpfulness. Teaching Methodology factors consisted of 3 constructs, which were the Extemporaneous Delivery, Logical Development of Material, and Use of Appropriate Illustrations/ Examples. 600 students from 6 selected polytechnics out of 10 were used for the survey (selected from HND Business Programs) on proportional basis.

Purposive sampling was used in this study so as for the survey to cover only business students, who were in second and third years. A pretest of the data was done in Hotel Management and Fashion departments in the Takoradi Polytechnic. Using 5 Likert scales, the research variables were adapted from Hamid and Pihie, (2004) and modified; then revalidated by two research consultants who have experience in teaching and learning in the tertiary institutions. Data was analyzed using SPSS Version 17, for descriptive statistics.

FINDINGS

Respondents' Profile: The response rate for the study was 86%. Regarding an acceptable response rate Babbie (1990) quoted an acceptable response rate of 60% as 'good' and 70% as 'very good' (rule of thumb only). Thus, the 86% response rate is considered encouraging. The demographic profiles of the students were made up of age, class and department. The descriptive statistics showed an average of 51% for 22 – 26 years; 29.5% for 17 – 21 years; and 19% for 26 or more years. The class of students was second-year (54.8%) third-year (45.2%). For departments, the profile was Accountancy (33.3%); Marketing (28.5%); Management & Secretaryship (19.4%); and Purchasing and Supply (18.8%).

Lecturers' Characteristics: The overall mean for the lecturers' characteristics construct was 3.65 and a standard deviation of 1.047, which suggests that the student highly agreed to the level of Lecturers' characteristics as a whole. The means of the results from the descriptive statistics showed high scores for all variables in the Lecturers' characteristics construct. This suggests that the students held positive satisfaction that lecturers teaching in the business studies programs possessed and exhibited good qualities. The individual constructs in the lecturers' characteristics are discussed below

Lecturers' Teaching Skills: The findings denote an overall students' perception about Lecturers' teaching skills to be high at a mean of 3.66 (SD 0.989). Of the four variables used to measure teaching skills, the highest mean was 3.71 for the item "Lecturers are always prepared to teach", while the lowest mean score were 3.61 for the other three items "Lecturers teach to students' satisfaction", "Lecturers make sure that

instructions for assignment are clear” and “Lecturers stimulate students’ thinking through problem solving techniques respectively”. This means that students perceive their lecturers to be skillful in their delivery. This is more likely to repose confidence in students. The findings also suggest that the Polytechnics in Ghana have qualified teachers who know their job. Although students highly agreed that the lecturers are very skillful when it comes to teaching, there were some levels of variations in response to specific dimensional characteristics of skillfulness. This finding suggests that students perceived skillfulness on two levels, which are technical (structural) and professional; and the findings showed that lecturers were perceived to be professionally exhibiting more skills but comparatively lesser technical skills.

Lecturers' Fairness: In this construct, the highest mean score was 3.67 for the item "Lecturers examination questions are clear"; while the lowest mean score was 3.03 for the items "Lecturers methods of grading students are fair." This means that students perceive their lecturers to be fair, which is good for student-lecturer relationship. It should also minimize any feeling of inequality that usually characterises intimidation, jealousy and uneasiness among students. Although students highly agreed that the lecturers were fair, there was some level of variations in response to specific dimensional characteristics of fairness. For example, the mean score of 3.03 compared to that of 3.67 indicate that students have some level of reservation when it comes to their perception of the clarity of examination questions and scoring of students in examination.

Lecturers' Firmness: Four variables were used to measure Lecturers’ Firmness. The findings showed an average mean of 3.91 (SD 0.966); the highest mean score being 4.00 (SD 0.966) was for the item "Lecturers ensure students meet deadlines for submission of assignment" while the lowest mean score was 3.75 (SD 1.039) for the item, "Lecturers frequently monitor students behavior in class." It is conclusive that from all the factors determining Lecturers characteristics; firmness is ranked highest; indicating that students perceive their lecturers to be very firm relative to other factors.

Lecturers' Helpfulness: Again four variables were used to measure Lecturers’ helpfulness. The findings showed an average mean of 3.56; the highest mean score being 3.68 (SD 1.067) was for the item "Lecturers are willing to help students"; while the lowest mean score was 3.45 for the item, "Lecturers ask follow-up questions, and allow more time for response." This finding suggests that though students on the average perceive highly that their lecturers in the business studies programs are very helpful, they are reserved to some extent at the level of constructiveness of help that is received.

TEACHING METHODOLOGY

The results showed an overall mean for Teaching Methodology of 3.68 (SD 1.067). This is an indication that the students in the business program expressed high agreement that they experienced quality Teaching Methodology. The findings in this quality factor were reported according to three constructs: Extemporaneous deliver, Logical development of material and Use of appropriate illustration/examples.

Extemporaneous Delivery: The highest mean score for this construct was 3.88 for the item “Lecturers use simple language that students can understand” while the lowest mean score was 3.32 for the item “Lecturers teach without necessarily reading from a notes. Comparing the highest mean score with the lowest, it can be seen that the study seems to suggest that students perceive lecturers as delivering their lecture with naturalness rather than being artificial. However, they think that lecturers can even do more to make lectures more natural and more appreciative.

Logical Development of Material: The study showed high level of quality in the logical development of materials for teaching in the business programmes in the Polytechnics in Ghana. This is illustrated by an

overall mean score of 3.58 (SD 1.046). Four variables were used to measure this construct. The highest mean score was 3.75 for the item “Lecturers follow planned lesson programme, while the lowest mean score was 3.42 for the item “Lecturers begin each lesson with a review of the previous lesson”. In between the two extremes, we have means scores of 3.66 and 3.48 for items “Lecturers specify the learning objectives for every lesson” and “Lecturers vary the pace of instructional activity respectively. The study suggests that student enjoy quality teaching material in a logically developed manner. This notwithstanding, the two extreme mean scores suggests that students would still expect their lecturers to do more review of previous lessons to draw a better and clear linkage between previous and current lessons for better understanding

Use of Appropriate Illustration/Examples: Students perceive the extent of use of appropriate illustrations and examples in teaching as high. The average mean score from students’ respondents was 3.33 (SD 1.143). The highest mean score was 3.66 on the items “Lecturers provide suitable examples, demonstrations and illustrations of concepts and skills”; and the lowest mean score was 3.06 for the item “Lecturers incorporate experiential learning e.g. field trips, simulation etc. in their teaching”. This indicates that although the business program in Ghanaian Polytechnics heavily emphasized research work, they give relatively lower attention to hands-on practical fieldwork.

F- RATIO AND ANOVA

The F ratio showed no significant difference in the perception of students in Business Programmes in Ghanaian Polytechnics on quality of Lecturers' Factors and Teaching Methodology as a whole. The overall state of the results were ($F = 1.50$ $p < .34$) for Age; ($F = 1.34$ $p < .43$) for Class; and ($F = 1.49$ $p < .37$) for department. The result is similar regarding the relationship of these variables with Lecturers' Factors and Teaching Methodology respectively. For Lecturer Characteristics, the findings showed ($F = 1.61$ $p < .34$) for age; ($F = 1.40$ $p < .45$) for class; and ($F = 1.49$ $p < .37$) for department. The results for Teaching Methodology were ($F = 1.35$ $p < .35$) for age; ($F = 1.26$ $p < .41$) for class; and ($F = 1.33$ $p < .32$) for department respectively. This means that on a whole students agree that there is high quality of teaching and learning.

On the individual variables, however, the results suggested some significance differences. For example, the items “Lecturers give freedom to students to choose their own group mates” and “Lecturers respect all students regardless of who they are”, and “Lecturers follow planned lesson program” were significant with age ($p < .032$; $p < .008$; and $p < .045$) for age 17 – 21; 22 – 26; and above 26 respectively. The mean scores showed that more students above age 26 agreed that their lecturers give them freedom to choose their own group mate; while more people in age 22 – 26 believe that lecturers respect all students without discrimination; and also that lecturers follow planned program during lessons. This means that for those three variables, students’ age affect their level of perception. Again, different classes were found to have varying position with regards to qualify of Lecturers' Factors in two items. The ANOVA results indicated a significant difference in students’ perception; $p < .041$, and $p < .001$ for items “Lecturers are willing to help students” and “Lecturers use various teaching methods that help students to understand the subject” respectively. The mean sores indicated that more students in second year expressed strong agreement for these variables compared to those in third year. This implies that the higher they go the more the students expect from their lecturers to help and use varying methods to enhance students’ understanding.

Furthermore, the ANOVA results revealed that there were significant differences in students’ perception in both Lecturers' Factors and Teaching Methodology for different departments. For the Lecturers' Factors, the ANOVA results was $p < .000$ for the item “Lecturers respect all students regardless of who they are”; and for the Teaching Methodology, it was $p < .016$ for item “Lecturers use simple language that students can understand. The mean score revealed that compared to the other departments, more people in Accountancy perceive their lecturers to respect all student without any discrimination. This suggests that

either lecturers in Accountancy department might demonstrate high sense of respect than those in other departments, or expectation of students in the other department as to how lecturers demonstrate respect for them is too high. Similarly, relative to other departments, Management and Secretaryship students believe strongly that their lecturers use in their teaching, language that is simple and understandable. Perhaps this might be explained by the fact that students in Management and Secretaryship are comparatively good in the English Language (the medium of communication) due to the nature of the program they pursue.

DISCUSSION AND RECOMMENDATIONS

The survey suggests that the majority of the student sample in the business studies programs in the six Polytechnics in Ghana were highly satisfied with the overall service quality for teaching and learning based on Lecturer Factor and Teaching Methodology. The descriptive statistics showed a high level of students' satisfaction. From the descriptive statistics, it was shown that the students' satisfaction was really high in both Lecturers' Factors and Teaching Methodology. However there were differences in the level of satisfaction, which illustrates that students' perception of quality teaching and learning were met more in some areas than others. Much as lecturers should be commended for their hard work, they should also be encouraged to do more not only to satisfy students with their provision of quality teaching and learning, but also go beyond to delight them. Business faculties therefore need to have more proactive monitoring mechanisms to management lecturers' performance so that under-performing lecturers are identified and sanctioned.

Significant differences in the perceptions of few variables in Lecturers' Factors and Teaching Methodology were attributed to students' age, class, and department. Though students should not be allowed solely to choose their own group mates since that might affect the purpose of grouping intelligent with less intelligent ones; they should be allowed to make meaningful input into the selection. In this case the dual purpose of respecting students' opinion and at the same time having a mix of intelligent and less intelligent students shall be met. Other variables that saw some significant difference in perception were the lecturers' willingness to help students and their use of various teaching methods. The significance difference was attributed to class. It is recommended that lecturers should extend help to all students irrespective of their class. Lecturers should update and vary their teaching methods, especially for the third years. As students go through the teaching process year after year, they become familiar with many teaching methods; thus unless lecturers update themselves with new methods of teaching senior students shall not appreciate them.

The significance difference in department is seen in lecturers' inconsistent respect for students; and lecturers' use of simple and understandable language. Mutual respect for lecturers and students must be encouraged, while ensuring that students in business departments should not expect more than necessary respect from their lecturers. It is again recommended that since English is the medium of communication in the Polytechnics, management of the institution should include 'quality written and spoken English' as part requirement for recruiting lecturers. Moreover training and seminars on effective communication should be organized for lecturers to update their communication skills. On the part of students, the 'Communication Skills' course should be taken seriously to enhance knowledge of the English language to improve their understanding.

More dialogues with students need to be carried out by faculties and school authorities so that a better means of evaluation of teaching and learning factors shall be adopted for the benefit of both the students and the school. The ministry of education must consider organizing programmes on Education, specifically on teaching methods for Lecturers in the Polytechnics as it is done in the Second and Basic schools in Ghana. "Teaching is an art and must not left to chance". The Polytechnics can also consider qualification in Education, at least to Diploma Level, as a requirement for recruitment into the teaching at

the Polytechnic. Finally, the study has revealed the hard work being done by the lecturers in the Polytechnics Business Programmes in Ghana. The government can show appreciation to lecturers by the introduction of Best Polytechnic Teacher Award. This should go a long way to encourage, motivate and enhance teaching and learning in the institutions, for higher student's (customer) satisfaction.

CONCLUSION

This study was carried out to examine the quality of teaching and learning in Business Studies (HND) Programs in Polytechnics in Ghana. The findings indicated that students in the Polytechnics had high perceptions of the quality of their Lecturers, and the Teaching Methodology employed in the program. This study is basically quantitative and hence could not ascertain in-depth issues. Thus, a more in-depth, and qualitative studies need to be carried out to examine the details pertaining to the differences of perceptions on all seven quality variables based on age, class and department.

THE MODERATING EFFECTS OF PERSONALITY ON RELATIONSHIP BETWEEN INCENTIVE MOTIVATORS AND PERFORMANCE

Payam Vaseghi, John Molson School of Business, Concordia University
Alireza Vaseghi, Mashhad University of Medical Sciences

ABSTRACT

Research findings have shown that incentive motivators, including various monetary rewards and compensation components, performance feedback and social recognition, affect performance. However, the mediating effect of personality on this relationship has not been studied enough. In this study, we proposed that personality moderates this relation; meaning that, the effects of those incentives would not be the same on the performance of individual with different personality traits. Moreover, we proposed that different personality traits are indicators of strength of different psychological needs (competence, relatedness, autonomy), which are identified by Self Determination Theory (SDT). To be more elaborate, the distribution of these three basic psychological needs is different across individual with different personality traits. For instance, the need for relatedness seems to be greater for extroverts and agreeable individuals, while need for autonomy seems to be higher among individual with introversion and disagreeable profile. This hypothesis, if tested, could help us to find out how personality influences the incentive-performance relation. Simply put, while each trait is indicator, and each incentive is satisfier of some needs, we can explain why and how the effects of incentives on performance, are distinctive among different employees. These propositions should be investigated in simulated lab settings for most reliable results.

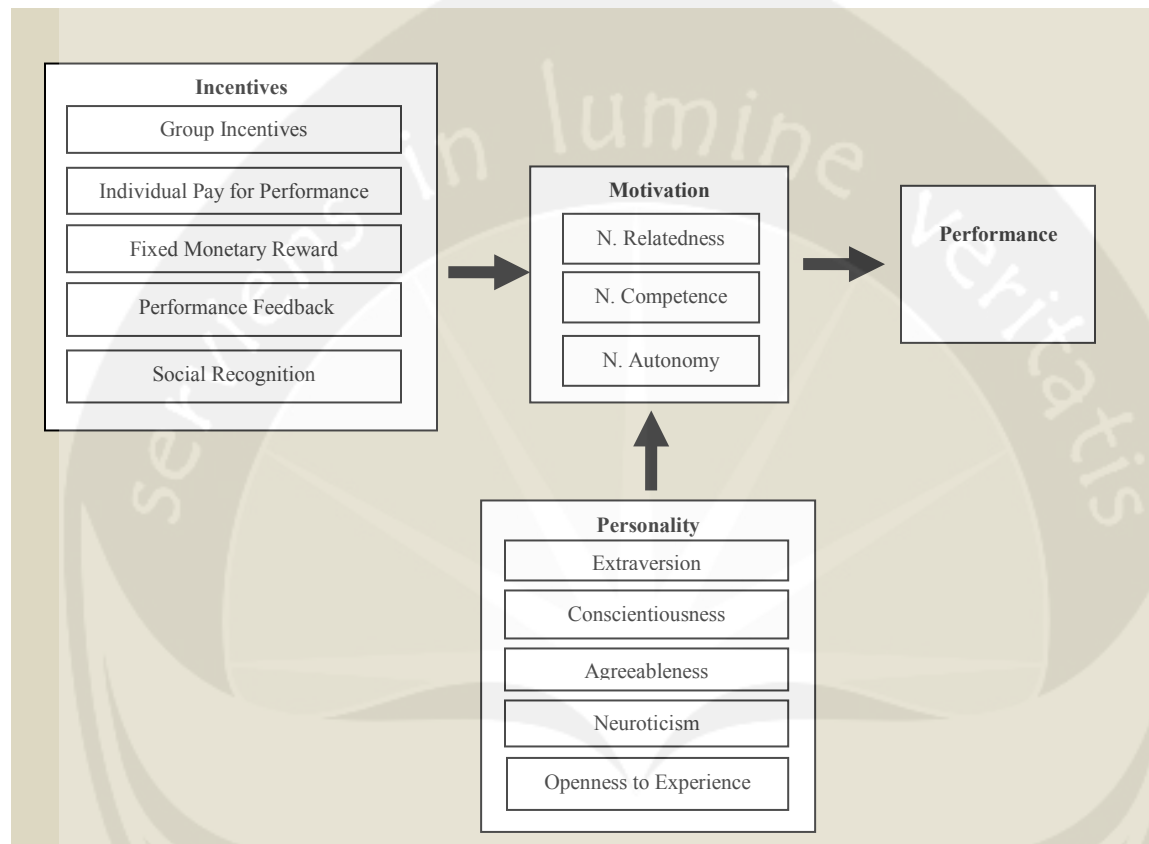

KEYWORDS: Incentives, Performance, Personality, Basic Psychological Needs

INTRODUCTION

There is extensive literature on the influence of both various incentives (Stajkovic & Luthans, 1998, 2001) and personality traits (Barrick & Mount, 1991; Tett et al., 1992; Judge & Bono, 2001; Hogan & Holland, 2003) on performance. However, the moderating effect of personality traits on the relationship between various incentives and performance has not been studied by the time being. The main objective of this research has been to study the influence of various types of incentives on individuals with different personality traits, in terms of performance. Digging the literature of incentive motivators and individual differences brought us to this idea that various incentives might affect performance differently across different individuals, and provided us with some hypotheses. However, for further explaining these effects, a lack of theoretical framework sensed. There is almost no doubt on the fact that personality influences this relationship through the mechanism of motivation. While most researchers would implicitly agree that there are individual differences in motivation that can be traced to dispositional tendencies (Judge & Ilies, 2002), some recent studies have proved these distinct preferences (Vandenberghe et al., 2008). Nevertheless, the problem is that there is not much agreed-upon literature in personality-motivation relation. Judge and Ilies (2002) have addressed the relative disarray in the literature regarding the personality-motivation relation to (a) lack of unified and theoretical perspective in revealing this relationship, (b) focusing on narrow range of traits (e.g. self-efficacy), and finally (c) assessing effects separately and lack of comprehensive view to analyze integrated effects of personality traits as a system. To overcome aforementioned obstacle, we intended to use the Self Determination Theory (SDT) to study the relationship between personality and motivation. According to self determination theory there are three basic psychological needs (need for autonomy, competence and relatedness), which their satisfaction provides the nutriment for intrinsic or fully internalized extrinsic

motivation (Gagne & Deci, 2005). The second objective of this research is to show that the distribution of these psychological needs is different across individuals with various personality traits, and provide a comprehensive framework to clarify the relationship between personality and motivation. Finally, with help of this framework, we are going to justify and further explain the moderating effect of personality on incentive-performance relation. The figure 1 summarizes the whole intent of this study.

Figure 1: The Moderating Effect of Personality on Incentive-Performance Motivation

RESEARCH OBJECTIVES

The purpose of this study is to investigate the moderating effect of personality on the relationship between incentive motivators and performance. We proposed that the effects of incentive motivators (e.g. money, feedback and status) on performance should be different across individuals with different personality traits, while the pattern of influence would be the same in each specific trait. We first suggested motivation as the mediator in the incentive-performance relationship. Then, based on literature, we proposed that there should be a relationship between personality and three basic psychological needs (needs for autonomy, relatedness and competence). Finally, since personality influences the strengths of these needs, and motivation is the mediator of incentive and performance, personality should have a moderating effect on incentive-performance relationship. While each trait is indicator, and each incentive is satisfier of different needs, incentives should have a different motivating effect and performance outcome. After a literature review of personality, incentive motivators and basic psychological needs (Self Determination Theory), propositions have been provided to link the personality and motivation, and also personality and incentive-performance relation.

LITERATURE REVIEW

Personality

In this study for analyzing the personality trait, the Five Factor Model (FFM), which is also referred to as the Big Five Model, has been used. This model is considered to be one of the most comprehensive, empirical, data-driven research findings in the history of personality psychology and has been validated by several researches and studies (McCrae 1992; Smith et al. 2001). According to Judge and Ilies (2002) "If a consensual of traits is ever to emerge, the five factor model is probably it" (p.798). There is widely consensus among both personality and I/O psychology researchers on this model, as the most accepted framework of personality for the time being (Barrick et. al., 2002; Judge & Ilies, 2002). The FFM model has been used as a standard framework for prediction of not only attitude and behavior, but also work performance (Vandenberghe et al., 2008) and several recent meta-analyses have shown consistent relationship between five factor model and job performance (Barrick & Mount, 1991; Tett et al., 1991; Mount & Barrick, 1995; Salgado, 1997). This model initially included the following traits:

Extraversion: The trait is marked by pronounced engagement with the external world. Extroverts enjoy being with people, and are often perceived as full of energy. They tend to be enthusiastic, action-oriented and sociable. In groups they like to talk, assert themselves, and draw attention to themselves. Outgoing, confident, spontaneous, dynamic, friendly, lively, impulsive, ambitious and imaginative are other characteristics of the extroverts (Vandenberghe et al., 2008). On the other hand introverts lack the exuberance, energy, and activity levels of extroverts. They tend to be quiet, low-key, deliberate, and less involved in the social world.

Conscientiousness: Is a tendency to show self-discipline, act dutifully, and aim for achievement. The trait shows a preference for planned rather than spontaneous behavior in order to achieve specific goals. This trait influences the way in which one control, regulate, and direct his/her impulses. These individuals are determined achiever and reliable (Barrick & Mount, 1991), as well as organized and deliberate (Costa & McCrae, 1992). Responsible, persistent, cautious, elaborate, methodical, efficient, orderly, ambitious and unrelenting, are other characteristics of conscientious individuals (Vandenberghe et al., 2008).

Agreeableness: The trait reflects individual differences in concern for social harmony. Agreeable individuals value getting along with others. They are generally considerate, friendly, generous, helpful, and willing to compromise their interests with others. Agreeable people also have an optimistic view of human nature and believe people to be basically honest, decent, and trustworthy. Polite, confident, tolerant, flexible, empathic, affectionate, malleable, easy-going and selfless are other adjectives of this group of individuals (Vandenberghe et al., 2008). Agreeableness is a tendency to be compassionate and cooperative rather than suspicious and antagonistic towards others. On the other hand, disagreeable individuals place self-interest above getting along with others. They are generally unconcerned with others' well-being, and are less likely to extend themselves for other people.

Neuroticism (sometimes reversed and called Emotional stability): is the tendency to experience negative emotions, such as anger, anxiety, or depression. It is sometimes called emotional instability. Those who score high in neuroticism are emotionally reactive and vulnerable to stress. They are more likely to interpret ordinary situations as threatening, and minor frustrations as hopelessly difficult. Their negative emotional reactions tend to persist for unusually long periods of time, which means they are often in a bad mood. At the other end of the scale, individuals who score low in neuroticism are less easily upset and are less emotionally reactive. They tend to be calm, emotionally stable, and free from persistent negative feelings.

Openness to experience : is a general appreciation for art, emotion, adventure, new ideas, imagination, curiosity, and variety of experience. The trait distinguishes imaginative people from down-to-earth,

conventional people. People who are open to experience are intellectually curious, autonomous, flexible, innovative, independent and unconventional (McCrae, 1987).

Incentives

Today contingent incentive motivators are not generally used to manage and improve employees' productivity and performance and this powerful tool has been mostly ignored or neglected (Stajkovic & Luthans, 2001). Based on different aspects of outcome utility, informative content and the regulatory mechanism, incentive motivators can be categorized to (1) monetary incentives, (2) performance feedback and (3) social recognition (Stajkovic & Luthans, 1997, 2001).

Monetary Incentives: Financial incentives of all kind (various-pay, pay for performance, fixed salaries, group incentives, merit-based and so forth) share the common characteristics of costing the organizations, being tangible payoff and exchanging functionality (they can be exchanged for goods and services). This tangible payoff with the exchange function is the final outcome of the monetary rewards (Bandura, 1986; Stajkovic & Luthans, 2001). In terms of regulatory mechanism and information content, various monetary rewards differ quite significantly. If the monetary incentives are given in a performance-based mechanism, it can convey implicit information about the level of performance; however, such information is not embedded in fixed-pays such as straight salaries. Stajkovic and Luthans (2001) indicated two distinct regulatory mechanisms for this type on incentives, instrumental and symbolic. Instrumental role of the money refer to providing the outcome which satisfy physiological or psychological needs; while the symbolic role is when it generates social comparison information, which is indicator of desirable and valuable status. In this study, we limited our studies on three kinds of monetary incentives: individual pay-for-performance, fixed remuneration and group incentives.

Performance Feedback: This flexible, cost-effective and simple incentive refers to information regarding the level of performance and progress of employees. Performance feedback is a very attractive development technique for enhancing work productivity, and if accurate and sufficiently detailed, it can helps employees develop the skills needed for task performance, and informs them about the behavior and strategy changes needed to improve performance (VandeWalle, 2001). The outcome of the feedback is a motivational power which is exclusively extracted from the information about the employee's performance (Bandura 1986; Stajkovic & Luthans, 2001). This motivational effect will be increase if the feedback is specific, immediate, positive and clear (Stajkovic & Luthans, 1997, 2001). Needless to indicate that feedback is the most informative type of incentives that can convey the expected level of performance, the progress process and required skills to attain the specified desirable goals. In terms of regulatory mechanism, feedback regulates individual behaviors by means of self-reflection (Bandura, 1986; Stajkovic & Luthans, 2001). To be more elaborate, individuals first set some standards for themselves (not always intentionally), then feedback clarifies the discrepancy between the set standards and desirable one. Subsequently, after self-evaluation, the subject individuals react to this discrepancy to make it as low as possible.

Social Recognition: Luthans and Stajkovic (2000) indicate social recognition as personal attention through expressions of interest, approval and appreciation for a well-done job. This incentive is not valuable by itself; however, it gets its outcome utility from invaluable predicted consequences (mostly material rewards) such as promotion, raise and so forth (Bandura, 1986; Stajkovic & Luthans, 2001). In terms of information content, unlike performance feedback, this incentive does not provide information about the process of performing the task, but it is informative in a way that the desirable goals or ends have been achieved. Stajkovic and Luthans (2001) indicated forethought as a regulatory mechanism for this type of incentives: "The forethought is a self-regulatory mechanism that allows perceived future outcomes, based on social recognition, to be cognitively transferred into current action" (p.583).

Self-Determination Theory (Sdt)

The part of this theory that contributes most to our study is its basic psychological needs. According to self determination theory, there are three basic psychological needs (need for autonomy, competence and relatedness), which their satisfaction provides the nutrients for intrinsic or fully internalized extrinsic motivation (Gagne & Deci, 2005). Autonomy, which refers to volition, is the need of having choices and feeling to be free and initiator of one's action. Relatedness refers to the desire to feel connected to others in a mutual way; love, care and rely on others, and at the same time being loved, cared and relied upon (Deci & Ryan, 2000). Competence refers to the need of being capable of succeeding at optimally challenging tasks and achieving desirable goals (Baard, 2002). According to this theory, work climates that promote satisfaction of these three basic psychological needs will enhance employees' intrinsic motivation and promote full internalization of extrinsic motivation. This will in turn lead to increase in other important work-related factors including persistence, performance, creativity, job satisfaction, positive work related attitudes, psychological adjustments, organizational citizenship behavior and so forth (Gagne & Deci, 2005). The focus of SDT research is not on the consequences of the strengths of these needs in different individuals, but it is rather on the consequences of the extent to which individuals are able to satisfy the needs within social environment. However, this does not mean that the strength of these needs is the same for all individual or that the researchers of this theory were not aware of these individual differences. Deci & Ryan (2000) explained: "In selecting this focus for examining individual differences, we do not maintain that there are no differences in need strength. Rather, we suggest that a focus on the strength of innate needs does not get at the issues we consider most important" (p. 232). Now, what urged us to observe the consequences of need strength here was the fact that we believed personality moderates the incentive-performance relation through the mechanism of motivation, and at the individual level there was no comprehensive framework to explain why and how individuals with different personality traits might be motivated differently.

THEORETICAL FRAMEWORK

Linking Personality to Motivation and Incentive-Performance-Extraversion-Needs & Extraversion-Incentives

Extraverts in comparison with introverts are more likely to enjoy being with people and engaging with external world. Their sociable and friendly nature made us draw the first proposition that the need for relatedness is greater for these individuals rather than introverts who are not comfortable in social situation and prefers solitary. We also predicted the need for autonomy to be greater for introvert type of individuals. Research findings have revealed that extroverts have a more significant desire to excel and get ahead of others (Gray, 1987; Lucas et al. 2000; Stewart, 1996; Barrick et. al. 2002). Thus, we proposed that the need for competence is greater for extrovert than for introverts. According to the Eysenck's arousal theory, introverts have a higher basal arousal level than extroverts (Eysenck, 1967) and this greater excitation of introverts, leads to less risk taking behaviors. Consequently, extraverts are more attracted to compensations and variable incentives rather than fixed monetary rewards (Lucas & Diener, 2001) and prefer variable pay-for-performance (Vandenberghe et al., 2008) since they are more risk tolerant (Lindy & Borgen, 2000). Moreover, Stewart (1996) found that there is positive correlation between extraversion and performance in sales, only when the performance is explicitly rewarded. Thus, we suggested that individual pay for performance has a greater positive effect on the performance of extraverts rather than introverts, while the effect of fixed pay is reverse. Moreover, research findings indicate that extraverts more engage in social interactions (Lucas et al. 2000), attach importance in cooperation (Barrick et al, 2002), prefer team oriented culture and avoid aggressive competitive culture (Judge & Cable; 1997). Based on these research findings we proposed that group incentives have greater positive effects on extroverts' performance rather than introverts'. Extroverts also more like to assert

themselves and draw attention to them, which made us predict that social recognition would be more effective in performance improvement of this group of individuals. This proposition is consistent with the research finding that extroverted individual shows higher striving for status (Barrick et. al. 2002). Based on research findings, extroverts and introverts are also significantly different in process of behavior alteration and response in the face of negative feedbacks and punishments (Pearce-McCall & Newman, 1986). However, since the aim of the study is to find out the effects of performance feedback as an incentive, which is insisted by literature to be positive, considering these findings in this context is irrelevant. Our propositions regarding extraversion are as follows:

Extraversion & Needs

- Proposition 1-a: Need for relatedness is positively correlated with Extraversion.
- Proposition 1-b: Need for autonomy is negatively correlated with Extraversion.
- Proposition 1-c: Need for competence is positively correlated with Extraversion.

Extraversion & Incentives-Performance

- Proposition 1-d: Extraversion positively moderates the effect of variable pay-for-performance incentives on performance.
- Proposition 1-e: Extraversion negatively moderates the effect of fixed monetary incentives on performance.
- Proposition 1-f: Extraversion positively moderates the effect of group incentives on performance.
- Proposition 1-g: Extraversion positively moderates the effect of social recognition on performance.

Conscientiousness-Needs & Conscientiousness-Incentives

The trait shows a preference for planned rather than spontaneous behavior in order to achieve specific goals. Conscientious individuals are ambitious, hardworking, self-disciplined, determined, and achievement oriented (Costa & McCrae, 1992; Goldberg, 1992). Among five personality traits, conscientiousness seems to be the most related trait to need for competence and our first proposition in this section is that conscientious individuals have a greater need for competence. Research finding has linked conscientiousness to goal-setting motivation (Barrick et al., 1993; Gellatly 1996, Barrick et. al. 2002) and motivational criteria regarding performance (Judge & Ilies, 2002). Conscientious individuals tend to set challenging goals and try to be committed to them and achieve them. Additionally, these individuals found to have a higher need for achievement and based on research findings, individual with high need for achievement prefer individual performance-based incentives (Turban & Keon, 1993). Based on these findings we proposed that individual pay-for-performance has a greater effect on performance of conscientious individuals, while the effect of fixed pay is reverse. Moreover, research findings have revealed that conscientious individuals are more likely to seek learning opportunities (Colquitt & Simmring, 1998; Colquitt et al., 2000). Their mastery goal-orientation makes them to ascribe more prominence on performance feedback. Thus, we suggested that performance feedback has a greater influence on performance of individuals with high scores on conscientiousness.

Conscientiousness & Needs

- Proposition 2-a: Need for competence is positively correlated with Conscientiousness.

Conscientiousness & Incentives-Performance

- Proposition 2-b: Conscientiousness positively moderates the effect of variable pay-for-performance incentives on performance.
- Proposition 2-c: Conscientiousness negatively moderates the effect of fixed monetary incentives on performance.
- Proposition 2-d: Conscientiousness positively moderates the effect of feedback on performance.
- Proposition 2-e: Conscientiousness positively moderates the effect of social recognition on performance.

Agreeableness-Needs & Agreeableness-Incentives

Barrick et al. (2002) describe agreeableness as the fundamental trait associated with the intention to strive for communion (desire to be part of a larger spiritual or social community) with others. As agreeable individuals value more on getting along with others, we proposed that the need for relatedness to be greater for this group of individuals (compare to those who scores low on agreeableness). On the other hand disagreeable individuals are more hostile, aggressive, suspicious and antagonistic towards others; thus, we predicted that the need for autonomy is greater for individuals with lower scores on agreeableness. Regarding the need for competence there is not much evidence showing that this need is various upon this trait. As agreeable people more accept and tolerate variable incentives like pay-for-performance, while disagreeable individuals prefer fixed remuneration, we proposed that the effect of pay for performance incentives is greater on agreeable individuals, while fixed monetary incentives are more effective on disagreeable individuals in terms of performance. Research findings indicated that agreeable individuals are more motivated by communion (Judge & Ilies, 2002) and cooperation rather than competition (Costa & McCrae, 1992; Vandenberghe et al., 2008) comparing to those who scores low in this trait. Moreover, a meta-analysis found a correlation between agreeableness and performance of team-oriented jobs (Mount et al., 1998). These findings suggest group incentives to have a higher impact on the performance of agreeable individuals. Agreeable people have also been found to suffer less from social rejection (Bierman, 2003) and cope through self-sacrifice rather than create an image of superiority above others (Costa & McCrae, 1992). According to these findings, we can predict that social recognition may contain more importance for disagreeable individuals.

Agreeableness & Needs

- Proposition 3-a: Need for relatedness is positively correlated with agreeableness.
- Proposition 3-b: Need for autonomy is negatively correlated with agreeableness.

Agreeableness & Incentives-Performance

- Proposition 3-c: Agreeableness positively moderates the effect of variable pay-for-performance incentives on performance.
- Proposition 3-d: Agreeableness negatively moderates the effect of fixed monetary incentives on performance.
- Proposition 3-e: Agreeableness positively moderates the effect of group incentives on performance.
- Proposition 3-f: Agreeableness negatively moderates the effect of social recognition on performance.

Openness-Needs & Openness-Incentives

According to characteristics of individuals with high scores in this trait, it is not difficult to predict that they have a high need for competence and more specially autonomy. The need for competence is high for

these individuals because they are more mastery goal-oriented and are more likely to seek development and promotion opportunities (Vandenberghe et al., 2008). Openness to experience has been found to be correlated with many cognitive abilities such as creativity (McCreae, 1987) and general intelligence (Austin et al., 2002; Moutafi et al., 2003); thus, it would be natural that individuals with high scores in this trait feel more competent and seek more competence. They inherently seek flexibility, innovation and autonomy (McCrae, 1996; Vandenberghe et al., 2008). Moreover, research findings indicate that the flexibility of work conditions has a significant influence on the attractiveness of rewards for open to experience individual (Vandenberghe et al., 2008). Consequently, we proposed that the need for autonomy and competence is greater for open individuals. In terms of incentives, open individuals exert significant importance on variable pay (Vandenberghe et al., 2008). Thus, we proposed that while individual-pay-for-performance has a greater effect on the performance of open employees, while the effect of fixed incentives is reverse. According to VandeWalle (2001), mastery-oriented individuals tend to consider feedback as useful diagnostic information about progress in performance. Thus, it is suggested that performance feedback has a greater effect on the performance of individuals with high scores on openness to experience.

Openness & Needs

- Proposition 4-a: Need for autonomy is positively correlated with Openness to experience.
- Proposition 4-b: Need for competence is positively correlated with Openness to experience.

Openness & Incentives-Performance

- Proposition 4-c: Openness to experience positively moderates the effect of variable pay-for-performance incentives on performance.
- Proposition 4-d: Openness to experience negatively moderates the effect of fixed monetary incentives on performance.
- Proposition 4-e: Openness to experience positively moderates the effect of feedback on performance.

Neuroticism-Needs & Neuroticism-Incentives

Those who score high in neuroticism are emotionally reactive and vulnerable to stress and are more self-conscious and shy, which made us propose the need for relatedness to be smaller for these individuals. Their negative emotional reactions tend to persist for unusually long periods of time, which means they are often in a bad mood. They are also more likely to interpret ordinary situations as threatening, and minor frustrations as hopelessly difficult. Neurotic individual need more space and authority in work environment as they get stressed and anxious under constant and close control. Thus, it is also suggested that these individuals have a greater need for autonomy. Neurotics and emotionally unstable individual are easily disturbed and experience stress, anxiety, anger and other negative emotions, which make them less self-confident (Barrick et al. 2003), more risk averse (Stewart & Barrick, 2004) and unable to perform the tasks competitively. Thus, they would be less motivated to carry out challenging or demanding tasks, which made us to propose that the need for competence is less for neurotics. Overall, literature shows a consistent pattern of negative relationship between performance motivation and neuroticism (Judge & Ilies, 2002). As these individuals are more risk averse and ascribe greater prominence to fixed remuneration, we suggested that fixed monetary incentives have a greater effect on the performance of neurotics, while the variable pay-for-performance incentives has a less influence. Research has also found that neurotics have a lower sense of self-efficacy (Judge & Bono, 2001), and are less likely to be goal-oriented and also self-regulated (Barrick et al., 2002). Thus, we predicted that feedback as a regulatory mechanism could boost the performance of these individuals, as it constantly shows them the required and desirable goals and expected outcomes, and provide them with adequate information about how to perform the task, which can reduce their stress and fear of failure.

Neuroticism & Needs

- Proposition 5-a: Need for relatedness is negatively correlated with Neuroticism.
- Proposition 5-b: Need for competence is negatively correlated with Neuroticism.
- Proposition 5-c: Need for autonomy is positively correlated with Neuroticism.

Neuroticism & Incentives-Performance

- Proposition 5-d: Neuroticism positively moderates the effect of variable pay-for-performance incentives on performance.
- Proposition 5-e: Neuroticism negatively moderates the effect of fixed monetary incentives on performance.
- Proposition 5-f: Neuroticism positively moderates the effect of feedback on performance.

CONCLUSION

This study suggests that there should be strong relationship between personality traits and basic psychological needs. This proposition, if tested, can help researchers and managers to predict the specific needs of individuals and employees. Moreover, since each type of incentive is better in satisfying certain types of needs, the moderating effect of personality in incentive-performance has been proposed. In terms of managerial implementations, these findings suggests that HR managers consider individual differences in compensation and incentive planning, and treat them accordingly to maximize job performance in the work place.

PREFERABLE EXECUTIVES' COGNITIVE STYLE AT EACH STAGE OF ORGANIZATION LIFE CYCLES

Payam Vaseghi, John Molson School of Business, Concordia University
Alireza Vaseghi, Mashhad University of Medical Sciences

ABSTRACT

There are too many different perspectives in strategic decision-making process within the literature. The rational normative model suggests that organizations, first, based on internal and external analysis determine some objective criteria to achieve value-maximization, and then based on those objectives make decisions. However, many research findings indicated that rational model is moderated by many individual-level and environmental-level factors. At individual-level, rational decision-making model has been found to be affected greatly, by the characteristics of executives. Among those characteristics, cognition has significant effects on decision-making process. Executives have different cognitive style that makes them follow steps of decision making process -including information gathering, alternative generation, alternative evaluation, and decision finalizing- very differently. From the other side, organizations at different stages of organization life cycle (Introduction, Growth, Maturity and Decline) have different administration needs and subsequently, different decision making approach. In the triangle of firm's strategy, executives' cognitive style and organization life cycle, the strategy-life cycle side has been already studied in the literature. This research paper tries to investigate the other side of cognition-strategy, so that it can provides a theoretical framework that can explain the third side of cognition-life cycle based on the other two other sides. The aim of this conceptual paper is to find out the desirable cognitive style for executives, at each phase of organization life cycle.

KEYWORDS: cognitive styles, organization life cycle, executives' characteristics, strategic choice model, MBTI Type Indicator

INTRODUCTION

There are too many different perspectives in strategic decision making process within the literature. The rational normative model suggests that organizations, first, based on internal and external analysis determine some objective criteria to achieve value-maximization, and then based on those objectives make decisions (Hitt & Tyler, 1991). However, many research findings indicated that rational model is imitated and moderated by many individual-level and environmental-level factors (Eisenhardt & Zbaracki, 1992; Hitt & Tyler, 1991). One of these factors is the role of executives and managers in the decision-making process. Based on this prospective, which is labeled strategic choice, objectives are not consistent and constant across people and over time; and in addition to environmental conditions, the choices that managers make are the critical determinants of organization structure, processes and decisions (Miles & Snow, 1978). Simon (1947) was the first one who challenged the validity of value maximizing approach in decision making process and claimed the limitation of rational model. He argued that decision makers rarely make decisions based on complete information. Uncertainty and lack of comprehensive information is one of the main reasons that cause managers to reach different decisions. According to Cyert and March (1963), "uncertainty is a feature of organizational decision making with which organizations must live" (p.118). In absence of adequate information, managers use different approaches to deal with uncertainty. Among all executives' characteristics the one that has the greatest effects on decision making is the cognition. Managers have different cognition style, which makes them follow the steps of decision making process differently and reach to distinct decisions. Several researches have confirmed the significant effects of cognitive styles on strategic decision-making (Nutt, 1986a, 1986b; Haley, 1997; Walck, 1997; Myers et al., 1998; Gallen, 2006). Those researches have demonstrated

the characteristics of each style, the methods each uses in different steps of decision-making process, and most probable outcomes for each type. Although the research on cognitive styles has began long ago, but its linkage to environment, the other construct that affects rational decision-making, has not been well studied yet. In this paper, the research objective is to study this linkage more narrowly and find out the preferable cognitive style for different stages of organization life cycle. At each stage of organization life cycle (introduction, growth, maturity and declining), there is a specific administration need and the types of required decisions vary. The objective of this study is to find the most efficient and appropriate decision-making style for each phase of organization life. After a brief literature review on cognitive styles and organization life cycles, a theoretical framework will be provided to link cognitive styles and organization life cycles.

LIETRATURE REVIEW

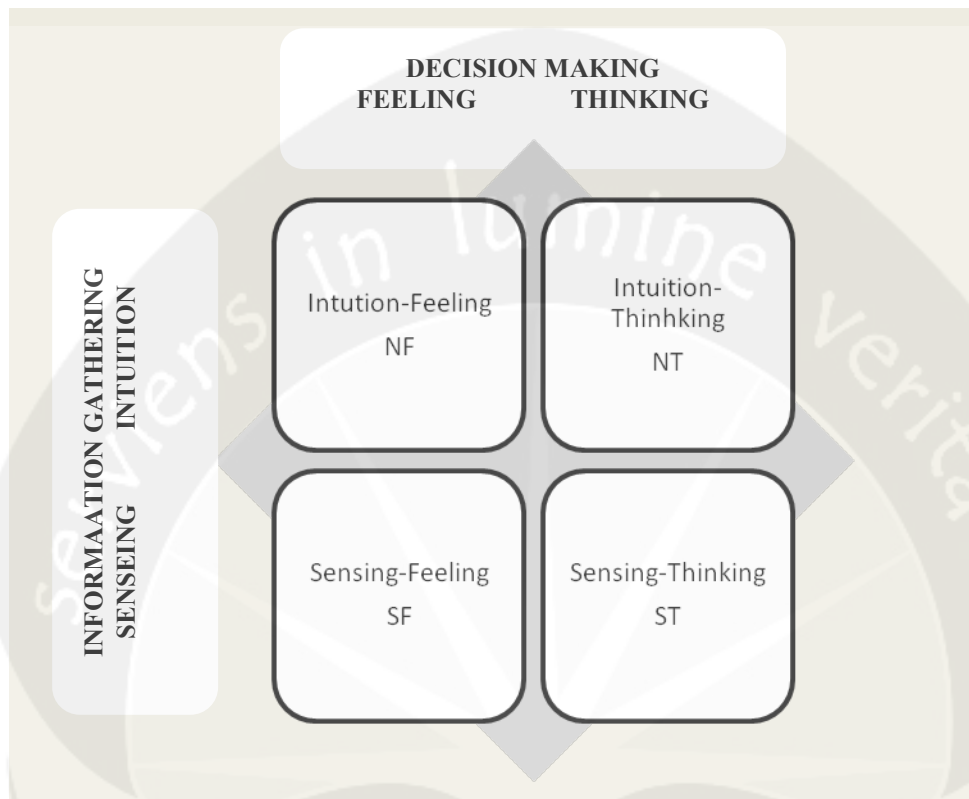

Cognitive Styles

Decision making process consists of several steps of information gathering, alternative generation, alternative evaluation and decision finalizing. Research findings have indicated that besides other external elements, such as organization structure, nature of the task, and environment, cognition has a great effect on decisions (Walck, 1997), as managers' cognitive styles influence the decisions they tend to make. Most of executives have preferred styles that use more often, particularly in ill-structured situations (Simon, 1978). Executives with different personality traits develop distinct decision-making styles as their preference and method of information gathering and alternative generation and evaluation differ significantly. In information gathering, managers seek selectively for specific information, concentrate on them and ignore others (Weick, 1979; Haley, 1997), and in decision-making, they differently use insight, intuitions and heuristics (Eisenhardt, 1992; Haley, 1997). In this study the Jung's (1923) psychological constructs has been used to categorize managers' cognitive styles. Based on Jungian psychological construct, individuals' cognitions are different in terms of information-gathering and decision making procedures. For each of these two processes, Jung suggested two distinct functions. In information-gathering (perceiving) process, an individual tend to use either sensing or intuition (S or N) functions. These functions describe the process in which individuals perceive and interpret information. The sensing individuals ascribe prominence significance on tangible and concrete facts. They trust information which is received via the five senses, and tend to doubt on intuitive guesses and hunches. On the other side, intuitive individuals trust on abstract information and insights that have come up from the unconscious mind. Based on the data gathered via one of these two functions, the decision making process is conducted. This judging process also consists of two distinct functions, feeling and thinking (F and T), and individuals tend to prefer one type in making rational decisions. Thinking individual are more analytical; they set a set of rules for decision making process and based on that, pick the more reasonable and matching option. On the other hand, feeling type of individuals make decisions based on their feelings. They seek options that are more in harmony and fit with a given situation and making them feel right. Myers (1980) developed these Jungian mental functions and claimed that conjunction of these functions in information-gathering (S - N) and decision-making process (T - F) determines the cognition style of individuals. The following matrix shows the four types of individual cognition styles.

Although Jung did not assume that these cognition style is absolute and unchangeable, but he believed that each individual has dominant preference style which tend to use most frequently in decision making and problem solving process. Taggart and Robey (1981) linked cognitive styles and brain hemispheres, indicating that STs are completely left-brained while NFs have a right-brained style, while NTs and SFs are in the middle and have accommodating styles. Managers with left-brained style ascribe greater prominence on analytical and quantitative techniques and apply rational and logical methods for reasoning, while ones with right-brained style apply intuitive techniques and use unstructured and

spontaneous procedure in decision making, considering the whole picture rather than its parts (Sauter, 1999). The characteristics of each cognitive style are presented in detail as follow.

Figure 1: MBTI cognitive Styles

ST (sensing-thinking): As discussed above, individual with this style are predominantly left-brained and use analytical and sequential process to reason from causes to effects by using details, specifics and pieces of logics. STs pay attention on facts that can be received by senses. They ascribe more importance on hard data and avoid personal analysis. These managers are more risk averse than other styles (Walck, 1997; Behling et al., 1980) and prefer to establish orders and mechanism of control to achieve certainty (Mitroff & Mitroff, 1980). Thus, they typically use problem-solving models that have worked in the past (Haley and Pini, 1994). These managers more focus on immediate and current problems and use standard operating procedures to solve them (Haley, 1997). According to Gallen (2006), regularity, structure and fit with standard practices are the basics for their decision, and consequently, they would be more decisive in well defined and regulated environment (Nutt, 1986b).

NF (Intuition-Feeling): This style is the extreme opposite of ST. These individuals are significantly right-brained, innovative, enthusiastic and insightful. They believe in their gestalts, feeling, hunches and intuitive perceptions, and look at the whole picture and broad theme rather than specific detailed parts. They avoid traditions and seek new possibilities and novel things that never happened before (Myers et al., 1998). Their decisions are based on similar experiences, analogy and personal views and judgment (Nutt, 1986a, 1986b; Haley and Pini, 1994). According to Haley (1997), these managers like working on ill-structured problems that requires innovative concepts and theories; they are inclined to creative problem solving and prefer novel, ingenious solutions, rejecting traditional methods and standard operating procedures. NFs managers have specific vision and engage in long-term goals. They tend to simplify the complex problems by reasoning based on analogies and heuristics. Analogy is a reasoning

process, in which managers need not understand every aspect of the problem at hand, rather, they just select some features and apply them to a past-solved problem or simple vivid situation (Gavetti & Rivkin, 2005).

NT (Intuitive -thinking): NTs share common characteristics with both NFs and STs, with some differences. Like NFs, NT managers also pay attention to new possibilities, but with this difference that they use non-personal, cause-and-effect perspective when judging (Myers et al., 98). Like STs, NTs ascribe great importance on analysis with this difference that they emphasis on long-range plans and new possibilities (Haley, 1997). Research findings indicated that Ns and Ts are better able to make decision in unstructured environments, comparing to Fs and Ss (Walck, 1997), thus the package, NT, outperforms other styles in complex situations. NT managers are more likely to recognize problems and patterns, and request more quantitative but general information for problem solving. According to Nutt (1986a), NT managers prefer long-term open ended projects which need more innovation, risk and observation.

SF (Sensing – Feeling): SFs ascribe importance on specific peoples' opinions and ideas in decision-making and believe that actions become feasible when people endorse them (Nutt, 1986a; Haley & Pini, 1944). Like STs, SFs appear to focus on problems facing them today. SF managers make decisions based on what people in a given situation need or want (Gallen, 2006). SF executives are more risk tolerant comparing to other styles; they ascribe more importance on facts and approach decision-making subjectively based on their own value system, as they use feeling as the judgment function.

Organization Life Cycle

Just like living creatures, organizations pass through four stages; they born, grow, mature and die. According to economic and organization theories, organizations share common characteristics at each stage of life cycles. These characteristics include both internal and external factors. In the following, some of these characteristics are pointed out.

Introduction Stage: This period begins with product innovation and development or some novel changes in the process. At this stage, the resources are limited, and there is emphasis on R&D and technological innovation. At introduction stage, the total sales volume is low and the stage lasts until the product is being manufactured in large quantity. The product or service is just introduced to the market and there is not a complete perceived need for it, within costumers. There is not a thorough and well defined organization vision and entrepreneurial insight yet (Lindell, 1991). In terms of economics, the total profit and sales is low and the gross profit per unit is high. There is constant product or service revision. The main focus of the organization or company is on establishing a market and arising demand for the product or service, consequently, marketing is significantly important at this phase.

Growth Stage: By the development of the product the innovation, activities shift from product to process in the growth stage. The volume of sales and production is gradually increasing and many positions and relationships are being created; so, neither the organization, nor market is stable yet. In terms of economic factors, total profit is high and rising, and at the same time, the sales and production volume is increasing. The product design is standardized. Competition is not considered as a significant threat, and risks are accepted by management. As the greater importance is on the processes at this stage, appropriate technologies for production and distribution are implemented; processes are routinized and systemized; manufacturing and marketing are being separated and accounting system for inventory control and purchasing are developed (Lindell, 1991). Jobs become more specialized, and communications within organization become formal at this phase.

Maturity Stage: At this stage, the sales growth is going to stop, the product is fully standardized and at the same time, processes are automated to achieve efficiency. At this stage there are lots of competitors with similar products or services, and thus, competition is significantly high and threatening, and is an

important concern in almost every decision. There is only minor innovation for modification purposes, and changes made only after a thorough investigation of all possible consequences. At mature markets, firms seek more low-cost strategies rather than innovative and differentiated ones. Actually, the bargaining power of buyers and competitive forces of rivals, incline firms to form tightly structured production and marketing process in order to achieve cost reduction and efficiency. At this stage total sales volume and profit is almost stable, and competitors try to defend their market share, rather than increasing the profit.

Decline Stage: At this stage as a result of unfavorable economic condition, significant change on customers' demands, or emergence of new and substitute products or services, organization experience its last phase of life cycle. At this stage the sales volume decline and profits are replaced by losses. Management is preoccupied with maintaining controls, and most of actions and decisions are related to cost cutting. The emphasis of management is on finance to overcome the financial crisis.

THEORITICAL FRAMEWORK

According to the literature and what have been discussed, executives' characteristics, and more specifically, cognitive style play a critical role in organization strategic decisions. Many research scholars have linked management inability or unwillingness to consider all strategic available alternatives to cognitive styles of managers (Gallen, 1997; Nutt, 1986; Miller & Toulouse, 1986; Gallen, 2006). From the other aspect, at each stage of organization life cycle there are some specific administration needs. For instance, in introduction and launching phases, there is a high need for creativity and flexibility; growth phase calls for operational planning and market penetration and accordingly analytic type of management; mature stage requires focus on efficiency and market share defense, and thus, needs some conservative and functional types of administration; and finally, at the declining stage, there is high a need for that type of management who can keep the organization together and react to the unfavorable pressures as fast as possible at the time of crisis. Significant differences among characteristics of stages of organization life cycle and cognitive styles imply that the effectiveness of different executives with different cognitive style varies at each stage of life cycle. Consequently, based on evidence in the literature, we proposed that for each stage there is favorable type of cognitive style. The table1 summarize the theoretical framework of the paper, which will be discussed more in depth afterwards.

Table 1: Strategy, cognition and organization life cycle relationships

Linking Organization Life cycles and Cognitive Styles--Introduction & NF Style

Based on literature, innovation is the core element of introduction stage, thus, more creative and insightful managers, like right-brained NFs, would be more successful at this stage. They avoid traditions and seek new possibilities and novel things that never happened before (Myers et al., 1998). As discussed earlier, NFs managers have specific vision and commit to long-term goals, and this is an essence in newly established markets. These managers prospect increasing corporate influence (Haley, 1997). NF managers are risk takers and believe in their hunches and intuition perceptions; and at the other hand, there is high uncertainty at introduction stage, because there is not stable and standardized product or service, identified customers and well-defined target market. Thus, NFs managers and organization in introduction

stage would be a great match. Other research findings have also confirmed the effectiveness of these managers at ill-structured situations (Haley, 1997; Walck 1997; Myers et al., 1998). Moreover, research findings indicated that this type of managers prefer to work in flexible and adaptive environment (Mitroff & Kilmann, 1975), which is one of the characteristics of the organizations at the first stage. Moreover, NF managers value marketing (Myers et al., 1998), which is very important at this stage. Finally, research finding has claimed that NF managers might more likely to follow prospector type of strategy (Gallen, 2006), and consistently, prospector strategy is the dominant type of strategy at introduction stage. Based on aforementioned explanations, we proposed that at introduction stage NF managers outperform management with other types of cognitive styles.

Proposition 1: NF managers outperform NTs, SFs, and STs at the introduction stage of organization life cycle.

Growth & Nt Style

At the growth stage, although the product or service is stabilized, but there is still need for innovation in processes, and some improvements in product or service. At the same time, while company has made a market for itself, it should consider and analyze its previous performance. NTs manager would suit best at this stage of organization life cycle. These managers pay attention to new possibilities, but use non-personal and cause-and-effect perspective (Myers et al., 1998); they ascribe greater importance on analysis with emphasis on long range plans and new possibilities (Haley, 1997). Walck (1997) indicated that in complex and open-ended environment, NTs managers outperform other types of management. Growth stage can be considered as the most complex stage, since the firm must both defend its current market and be aware of prospector strategies for profit maximization and growth opportunities, while at other stages, firm has one of the roles, most of the time. NT managers are more likely to recognize problems and patterns, and seek more quantitative general information for solving problems and these characteristics seems most useful at growth stage, while there is no adequate information and specific patterns in introduction stage, and everything is quite well-defined in mature markets. In terms of risk-taking behaviors, these managers are at the middle, they are not as challenger as NFs, and not as risk averse as STs. Consistently, firms at growth stage need managers and executives with this level of risk taking due to their dual roles as both defender and prospector. As discussed earlier, in unstructured environments, NTs and NFs outperform the two other types, and the market structure is not well defined in early stages of life cycle, introduction and growth. What distinguishes NT managers from NF executives is that they seek more quantitative data, while NF managers more use analogy-based intuitions (Kerin & Slocum, 1981). That is why NF managers more preferable at introduction level, while NT managers assumed to be more appropriate in the second stage. Moreover, NT manager more tend to follow analyzer type of strategies, which is the dominant strategy at the growth stage of life cycle (Gallen, 2006). The following proposition is made based on the above discussion.

Proposition 2: NT managers outperform NFs, SFs, and STs at the growth stage of organization life cycle.

Maturity & St Style

In this stage of market life cycle, both product and processes are almost standardized and firms compete over efficiency and cost. From the other side, ST managers pursue goals of profitability within the organization and emphasis financial market information (Haley, 1997). These managers are more logical and analytical; they focus on facts and hard data and avoid personal analysis. At maturity stage innovation is rarity and firms are completely engaged with prevalent problems rather than thinking of future trends. Consistently, unlike other NF and NT managers, ST managers more focus on immediate and current problems and use standard operating procedures to solve them, rather than thinking of future problems and possibilities (Haley, 1997). At maturity stage all rules, regulations, relationships, and also structure

of the industry have been stabilized; thus, it is the best time for ST executives to show their performance, as many research findings agreed that these managers have the best performance on well defined, stable and regulated environments (Nutt, 1986b). Unlike other stages, in a mature market there is a high competition and this competition assumed to be threatening and serious by managers. Compatible with these environments, ST managers found to be more risk averse (Nutt, 1986, 1990; Haley 1997). At mature markets, firms seek more low-cost strategies and try more, to defend their market share. According to Gallen (2006) findings, among managers with different styles, ST managers are more likely to follow defender types of strategies. Based on these findings we proposed that:

Proposition 3: ST managers outperform NFs, SFs, and NTs at the maturity stage of organization life cycle.

Declining & Sf Style

As discussed earlier, at declining stage, as a result of unfavorable economic condition, significant change on customers' demands, or emergence of new and substitute products or services, organization experience its last phase of life cycle. At this stage, the sales volume decline and profits are replaced by losses. Management is preoccupied with maintaining controls, and most of actions and decisions are related to cost cutting. Generally, at the declining stage, organizations face many internal problems as a result of cost-cutting strategies (e.g. downsizing), employees start to lose their trust and loyalty toward organizations, and cohesiveness of the organizations become fragile. At this crises stage, using SF managers could be more appropriate. These managers ascribe importance on peoples' opinions and ideas in decision-making and believe that actions become feasible when people endorse them (Nutt, 1986a; Haley & Pini, 1944). An important fact about dying stage is that this stage lasts until the product or service become completely extinct or organization breaks down and ceases the market. However, if organization could survive during this stage, maybe it could enter another introduction stage with a new product or service. At this time, the most important factor is protecting the internal cohesiveness of the organization, and this could be done best, by SF types of management. SF executives are also more risk tolerant comparing to other styles and this is the essence of management at this crisis stage. These managers narrow their focus on problems facing them today. Gallen (2006) proposed that SF managers more tend to follow reactor types of strategies. This finding is consistent with our proposition, as these strategies are more seen in declining stages. At the declining stage there is not a clear image about the future of the market, and organization just try to keep itself alive, so that an innovative movement could open up a new introduction phase. So, the firm just follow what environment or key players of the market- which are more likely to survive and come up with some innovations- dictate. In this situations SF executives who more concentrate on organizational endurance through internal effectiveness, could be the best option, at least for a specific period until there is an opportunity for some fundamental changes. Based on the aforementioned explanation we proposed:

Proposition 4: SF managers outperform NTs, NFs, and STs at the declining stage of organization lifecycle.

CONCLUSION

Although there is a strong consensus over undeniable effects of executives' characteristics on strategic decision-making process in the literature, yet, the mechanisms by which these effects take places are not well studied by researchers. Moreover, the relationship between environment and personality, as the two major constructs that influence on rational decision-making process has been neglected by research scholars. In this article, based on research findings in organization theory, organization behavior and economic science, we proposed that at each phase of organization life cycle, management with specific type of cognitive style would outperform. These findings could be beneficial in strategic management

literature in several ways. Firstly, it clarifies the role of executives' cognition in decision-making process in the context of environment, and explains why various management styles are more successful at different stages. Secondly, it helps organizations to match their executives with the stage of organization to achieve the best outcome. Finally, it is helpful for executives themselves, to recognize their strengths and limitations according to the organization stage, and use peripheral mechanism in decision-making process to cover their weaknesses and compensate for them. Although these findings sound cogent theoretically, but should be tested and validated in future researches.

PRICING EXECUTIVE MBA PROGRAMS: STRATEGIES FOR SENIOR MANAGEMENT IN BUSINESS SCHOOLS

Francis Petit, Fordham University

ABSTRACT

The purpose of this research is to determine the most strategic tuition pricing strategy that can be utilized by senior management in Business Schools when pricing Executive MBA Programs. To determine this information, the state of the Executive MBA market and three pricing strategies were reviewed in detail and an analysis ensued on the viability and applicability of each strategy for pricing Executive MBA Programs. The main findings of this study indicate that the "Value Based" pricing model is the potentially most strategic strategy that can be implemented, out of the pricing models evaluated, for pricing Executive MBA Programs so long as Business Schools have the ability to not only align the value of a particular program to the market demanded value but can also effectively communicate this value in the marketplace. The results of this exploratory study can have significant implications on the discussion of pricing Executive MBA Programs on senior management within Business Schools.

MEASURING THE PERCEPTIONS OF LUXURY BRANDS. A COMPARISON BETWEEN FINLAND AND THE UK

Glyn Atwal, ESC Rennes School of Business, France
Douglas Bryson, ESC Rennes School of Business, France

ABSTRACT

Vigneron and Johnson (2004) developed a Brand Luxury Index (BLI) scale using data collected in Australia. The BLI made it possible to compare the perceptions of luxury brands between different countries. This paper attempts to compare the perceptions of four luxury brands in Finland and the UK. The results of the study found that there were significant differences in terms of the perception of luxury brands between the French and Finnish samples. It can be concluded that the BLI scale needs to consider cultural factors that could influence consumers' perceptions. Further research should investigate the possibility of developing country-specific BLI scales.

WHAT EXECUTIVES CAN LEARN FROM U2: AN EXPLORATORY STUDY

Francis Petit, Fordham University

ABSTRACT

The purpose of this research is to determine what executives can learn from the successful development of the musical band and brand known as U2. To determine this information, a historical study of the U2 journey was conducted with the hopes of uncovering key learning points and takeaways for executives. The main findings of this study indicate that there are four (4) overarching themes that have lead to not only U2's success but can also be potentially implemented within the daily roles of executives. The results of this exploratory study can potentially ignite increased research into the "U2 Effect" and what Corporate America can learn from this musical group.

DO ONLINE PRODUCT REVIEWS AFFECT THE REPUTATION OF AN ONLINE INTERMEDIARY AND CONSUMER LOYALTY?

Shih Yung Chou, University of the Incarnate Word

ABSTRACT

Online reviews have been shown to have powerful impact on consumer purchase decisions. In addition, existing research has demonstrated the impact of online reviews on e-commerce outcomes such as sales. Yet, very little attention has been paid to how online reviews affect one of the important parties in e-commerce, an online intermediary. Therefore, this study focuses on investigating the impact of online reviews on an intermediary's reputation and consumer loyalty. The results of this study can be used to better understand e-commerce phenomena and to better design online review systems.

KEYWORDS: Online reviews, reputation, consumer loyalty

INTRODUCTION

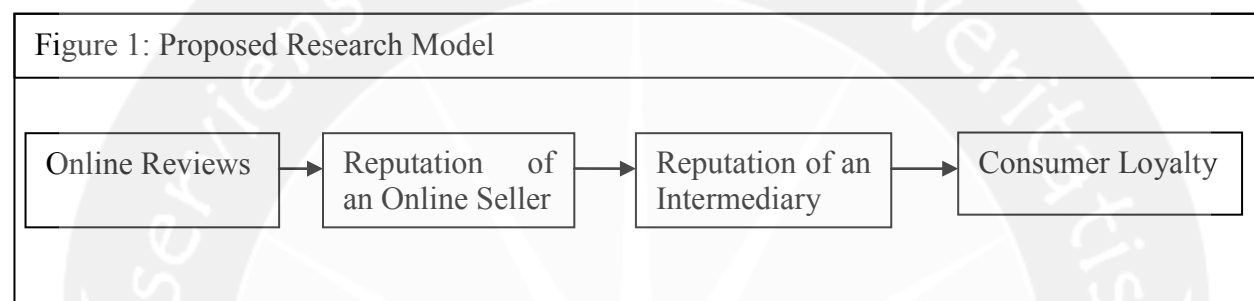

Because of the improvement of e-commerce (i.e., better security protocols), consumers are more willing to shop online than a few years ago (Picazo-Vela, Chou, Melcher, and Pearson). Among those improvements, online review systems have the most critical impact on e-commerce. An online review system allows consumers to access to product related information such as product descriptions, other users' experience, or product rating. Because online reviews have a great impact on prospective buyers' decisions, online reviews have been considered a proxy of overall word of mouth (Zhu and Zhang, 2010).

Since consumers can utilize online reviews to obtain information related to a product or a seller, many previous studies have investigated the relationship between online reviews and sales (e.g., Chevalier and Mayzlin, 2006; Hu, Liu, and Zhang, 2008; Resnick, Zeckhauser, Swanson, and Lockwood, 2006). Another important research stream on online reviews focuses on the impact of online reviews on seller's reputation. In general, previous studies have demonstrated that there is a significant relationship between online reviews and seller's reputation. For instance, Ba and Pavlou (2002) found that feedback mechanisms partly influence seller's credibility. Similarly, Pavlou and Dimoka (2006) showed that text-comment reviews affect a seller's benevolence and credibility.

In addition to online reviews and reputation relationship, several studies have shown that a firm's reputation could affect consumer loyalty. For instance, Bontis, Booker, and Serenko (2007) demonstrated that corporate profitability might reside in reputation's influence on customer loyalty. Casalo, Flavian, and Guinaliu (2008) showed a significant positive relationship between reputation and website loyalty. Valenzuela, Mulki, and Jaramillo (2010) found that a firm's ethical reputation helps in retaining customers.

A brief review of the literature has suggested that firms that conduct businesses electronically have adopted online review systems in order to facilitate purchase processes and to improve firm performance. Meanwhile, previous studies have also shown that an online seller's online review profile could affect its reputation, which in turn influences its consumer loyalty. Although this relationship could be perceived easily, the complexity of e-commerce could complicate this relationship. Specifically, many firms not only sell their products directly on their websites but also on intermediaries' websites. Some prominent examples of these intermediaries are Amazon.com, eBay, and Buy.com. These intermediaries allow online sellers, regardless their size, to sell their products on their marketplaces. By taking commissions from those online sellers, intermediaries therefore, are able to obtain profits.

Since one of the major purposes of an online review system is to provide prospective buyers an online seller's information, this design might affect the intermediary as well. Specifically, an intermediary provides online marketplace for other online sellers to sell their products. Consumers of these online sellers then are encouraged to provide online reviews describing their shopping experience. These online reviews, therefore, provide existing and prospective consumers an insight into the reputation of the online sellers. However, whether the reputation of an intermediary who provides an online marketplace is affected by the reputations of online sellers has not been investigated. Thus, the major objective of this study is to examine how the reputation of online sellers affects an intermediary's reputation. To do so, this study begins with investigating the impact of online reviews on an online seller's reputation. Next, this study examines the relationship between the reputation of online sellers and the reputation of an intermediary. Finally, this study investigates the impact of an intermediary's reputation on consumer's loyalty to the intermediary's marketplace. Figure 1 shows the proposed research model.

LITERATURE REVIEW AND HYPOTHESES

In the modern market environment, firms are competing not only for quality products but also for the capability to provide convenient shopping alternatives. This competitive pressure results in the adoption of e-commerce. Using the Internet, firms are able to sell their products ubiquitously. This phenomenon has led to the increased in Internet sales from 27 billion in 2000 to 133.6 billion in 2008 (USA Today).

Although the development and improvement of online marketplaces have significantly reduced consumers' time and effort to locate the products or services that they are interested in buying, online marketplaces are not without risks. These risks include privacy concerns, credit card frauds, and not being able to touch and feel the product. To overcome these issues, firms have adopted one of the most important e-commerce mechanisms, online review systems. An online review system is generally defined as a platform that collects, distributes, and aggregates opinions and comments about participants' past behavior (Resnick, Zeckhauser, Friedman, and Kuwabara, 2000).

Since an online review system is designed to solicit previous buyers' shopping experience, online review systems have been designed in various ways. For instance, eBay buyers are able to rate sellers in three ways: positive, neutral, and negative. In addition, eBay's online review platform provides buyers 4 criteria to rate a product including "item as described", "communication", "shipping time", and "shipping and handling charges". Using a 5-point star rating system, buyers are able to provide prospective consumers details about an online seller related to these 4 criteria. Similarly, Amazon.com allows buyers to rate an online seller in three options: positive, neutral, and negative. Amazon.com also uses a 5-point star rating system to show buyers an online seller's overall online review profile. In summary, modern online review platforms have been designed to allow users to use numerical rating and text comments.

As mentioned earlier, the major purpose of an online review system is to provide prospective buyers information about a product and an online seller. A number of previous studies have investigated and

found that online reviews have a significant impact on sales (e.g., Clemons, Gao, and Hitt, 2006; Dellarocas, Zhang, and Awad, 2007; Forman, Ghose, Wiesenfeld, 2008; Hu et al., 2008; Zhu and Zhang, 2010). Another research stream suggests that online reviews could have an important influence on seller's reputation and customer loyalty (e.g., Ba and Pavlou, 2002; Pavlou and Dimoka, 2006).

Yet, past research on online reviews has not focused on the impact of the reputation of online sellers affected by online reviews on an intermediary's reputation and consumer loyalty to the intermediary. Understanding this research gap is crucial as many intermediaries such as eBay, Amazon.com, and Buy.com have been providing their online marketplaces to online sellers to sell their products. In this study, we use transaction cost economics as our theoretical base since it has been suggested a viable theory for explaining online consumer behavior (Hu et al., 2008).

Transaction Cost Economies

Developed by Williamson (1979), the theory of transaction cost economics (TCE) argues that asset specificity, uncertainty, and transaction frequency determine whether a transaction is conducted in a market, hierarchy, or hybrid form. TCE consists of two simple yet important assumptions. First, human beings have bounded rationality. Second, people behave in opportunistic ways. Using these concepts, TCE suggests that since people have bounded rationality, they are not able to consider and to assess every possible scenario and therefore, engage in opportunistic behaviors.

Although TCE has been adopted as the theoretical base for research focuses at organizational level, several researchers have used TCE to explain consumer behavior in e-commerce. For instance, Liang and Huang (1998) applied TCE to investigate consumer acceptance of products in electronic market and found that the acceptance is determined by the uncertainty and asset specificity. Hu et al. (2008) adopted TCE to assess the effectiveness of the online review market and found that consumers pay more attention to both review scores and contextual information including reviewer reputation and reviewer exposure.

It is suggested that when consumers intend to purchase on a given online marketplace, they must go through a transaction process (Hu et al., 2008). When engaging in online purchasing, a consumer may not be able to verify a product quality or a seller's reputation using descriptions posted on the website. This may result in psychological uncertainties and therefore, a higher transaction cost is perceived by the consumer. According to TCE, people prefer to engage in transactions that minimizes their transaction costs. Using this concept, one can argue that an online consumer would prefer to purchase a product from a reputable online seller. In other words, online reviews will have a significant impact on an online seller's reputation.

Hypothesis 1: Online reviews will have a significant impact on an online seller's reputation.

As mentioned earlier, many firms and individual sellers have started to sell their products on their websites and/or on intermediaries' online marketplaces. Although many previous studies have investigated the relationship between online reviews and seller's reputation, very little attention has been paid to how seller's reputation affects an online marketplace provider, an intermediary.

Online reviews are usually used as a tool for online shoppers to acquire product information. However, unlike traditional face-to-face transactions, online transactions involve process uncertainty, which refers to the case where consumers purchase products from undesired vendors (Hu et al., 2008). The decision to purchase from undesired vendors might result from consumer's lack of information of the vendors. Because of the inability to obtain information about the undesired vendors, consumers are then engaging in uncertainty reduction activities to reduce or to eliminate the risk associated with this uncertainty (Berger and Calabrese, 1975; Hu et al., 2008).

In the context of e-commerce, an intermediary can provide an online marketplace to various sellers who sell their products in the marketplace. To provide better shopping experience, many intermediaries have also launched online reputation systems where both sellers and buyers are able to provide online reviews regarding to their transaction experience. This closed relationship between an intermediary and an online seller might create an impact on the intermediary's reputation. Specifically, an online review system provided by an intermediary offers buyers an opportunity to describe their shopping experience. Therefore, if in an online marketplace provided by an intermediary, buyers perceive that there are many disreputable sellers or buyers have negative shopping experience, they might attribute this situation to an intermediary's lack of effort in quality control and assurance. Therefore, as time goes by, buyers could perceive the intermediary as a disreputable party, which in turn leads to consumer's unwillingness to continually shopping on the intermediary's marketplace.

Hypothesis 2: The reputation of online sellers will have a significant impact on the reputation of an intermediary.

To survive in the competitive market environment, firms have to establish a long-term relationship with customers. Since the development of e-commerce, the number of participants in e-commerce has increased dramatically. Because of this phenomenon, many researchers have paid their attentions to the factors that influence consumer loyalty. For instance, Casalo et al. (2008) found that website familiarity and usability have a significant impact on consumer loyalty. Hansen, Samuelsen, and Silseth (2008) demonstrated that corporate reputation affects customer perceived value, which in turns affects word-of-mouth and customer loyalty. By examining e-commerce in two cultures (i.e., Korean and USA), Jin, Park, and Kim (2008) found that firm customer satisfaction leads to firm reputation, which in turn contributes to customer loyalty in both cultures.

It is suggested that reputation can be seen as the result of a firm's relational history with the context where it operates (Casalo et al., 2008). Based upon this concept, a firm's reputation is one of the indicators to the quality of the products it provides (Kijewski, Yoon, and Guffey, 1993). In other words, a firm's reputation can affect consumer's perceived quality of the products. In the context of e-commerce, online reviews can affect an online seller's reputation as argued earlier. Similarly, the reputation of an intermediary who provides online marketplace for various online sellers could be affected by those online sellers' reputation. Since previous research has shown that there is a significant relationship between reputation and consumer loyalty, one can argue that an intermediary's consumer loyalty can be affected by its reputation.

Hypothesis 3: An intermediary's reputation will have a significant impact on its consumer loyalty.

RESEARCH METHODOLOGY

Measures

Online Seller Reputation. Online seller reputation will be measured by adapting and modifying the scale developed by Fuller, Serva, and Benamati (2007). The scale consists of three dimensions including competence (4 items), benevolence (3 items), and integrity (3 items) with a 1 (strongly disagree) to 7-point (strongly agree) Likert Scale. The reliabilities measured by using Cronbach's alpha are 0.87, 0.83, and 0.84, respectively.

Intermediary Reputation. Intermediary reputation will be measured by adapting and modifying the scale developed by Fuller, Serva, and Benamati (2007). The scale consists of three dimensions including

competence (4 items), benevolence (3 items), and integrity (3 items). The reliabilities measured by using Cronbach's alpha are 0.87, 0.83, and 0.84, respectively.

Consumer Loyalty to the Intermediary. Loyalty will be measured by using a 7-item instrument developed by Zeithaml, Berry, and Parasuraman (1996) with a 1 (strongly disagree) to 7-point (strongly agree) Likert scale. Cronbach's alpha for loyalty is 0.91.

Data Collection

Online review data will be obtained from Amazon.com. The survey instrument will be distributed undergraduate students in a mid southwestern university. The use of students as participants has been suggested a viable approach. Specifically, it is suggested that young people (i.e., between 18 to 32-year old) are the dominant Internet users (Jones and Fox, 2009; McGann, 2005) and college students are the major Internet shoppers (Lim, Sia, Lee, and Benbasat, 2006). Partial Least Squares (PLS) technique will be use to test the proposed hypotheses.

STRIVE TO PREVENT PLAGIARISM BUT BE READY TO DETECT IT

Levon R. Hayrapetyan, Houston Baptist University

ABSTRACT

*Regrettably, plagiarism is widespread on university campuses. The advances in the information technology provide even more sophisticated cheating prospects. There are many commercially available tools for detecting plagiarism and the TurnItIn is probably the most commonly used such tool (<http://turnitin.com>). However, policing is not enough. We should strive to change the culture in university classrooms in such a way that it discourages academic dishonesty. In this study we present a tool called **Test Guard** that has two main features. First, it disables some cheating “techniques” such as copy-paste, insert file, etc. Then it checks the test for several types of plagiarism and generates a report on its findings.*

KEYWORDS: academic dishonesty, cheating, plagiarism

INTRODUCTION

As educators, we should strive to create an environment in academic classroom that discourages academic dishonesty. Naturally, there are two ways to fight plagiarism on university campuses – implement processes to prevent them and employ procedures to detect them if they occur. By analyzing the literature on academic integrity, one can notice that educators have directed their efforts mostly towards detection of plagiarism; much less work is done towards prevention of it. In this paper we present a tool called **Test Guard**, which has dual functionality. First, it tries to prevent cheating by disabling some cheating “techniques” such as copy-paste, insert file, etc. Then it checks the test for several types of plagiarism and generates a report on its findings. The report is embedded and hidden in the student’s test file and is password protected – only the professor can see it.

The remainder of the paper is organized as follows. Section 2 briefly discusses the relevant literature on academic dishonesty. The short description of the functionality of the **Test Guard** is described in Section 3. Section 4 describes the process of preparing the test file and Section 5 presents various cheating scenarios detected by **Test Guard**. Finally, Section 6 concludes the paper.

LITERATURE REVIEW

There have been many discussions of academic integrity in recent literature on education (Rudebock, R. D. (2005), McCabe, D., and Pavela, G. (2004), Chapman, K. J., Davis, R., Toy, D., and Wright, L. (2004), Storch, E. A., and Storch, J. B. (2002), Bernardi, R. A., Metzger, R. L., Bruno, R. G. S., and Hoogkamp, M. A. W. (2004), Carpenter D. D., Harding, T.S., Montgomery, S. M., Steneck, N. H., and Dey, E. (2002), Caruana, A., Ramaseshan, B, and Ewing, M. T. (2000), Coleman, N., and T. Mahaffey (2000), Hard, S. F., Conway, J. M., and Moran, A. C. (2006), Hardling, T. S., Carpenter, D.D., Finelli, C. J., and Passow, H. J. (2004). It continues to be one of the hot topics in the educational research because the severity of academic dishonesty is increasing. Academic dishonesty is analyzed and studied from various angles. For example, McCabe D.L. et al (2004) have outlined principles of academic integrity; Chapman, K.J., et al (2004) studied academic integrity in the Business School environment; Kidwell, L.A. et al (2003) and Koljatic, M. et al (2002) analyzed and compared students’ and faculty’s perception of dishonest academic conduct. There are many commercially available tools for detecting plagiarism and the TurnItIn is probably the most commonly used such tool (<http://turnitin.com>). An effective procedure

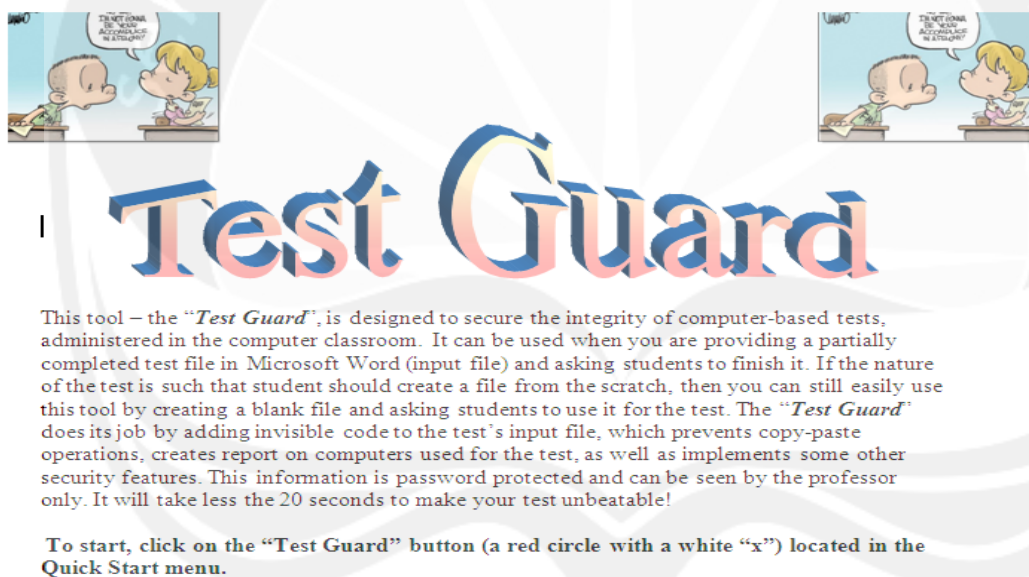

for handling cheating on multiple-choice tests was developed by Harpp and his colleagues (1993, 1996). Nath, L., and Lovaglia, M. (2009) developed software, which goes further by precisely estimating the probability that copying of answers took place between two students taking a multiple-choice exam.

HOW DOES THE TEST GUARD WORK?

As it was mentioned above, the tool is designed to be used in computer-based tests. It allows the detection of certain types of cheating, namely when one student submits a work that was completely or partially done by another student on another computer. Here are some possible cheating scenarios:

1. Student A asks his classmate Student B to help with the test. Student B completes the test and sends a copy of it to Student A. Then Student A slightly “personalizes” the file (adds his name, changes some colors or fonts, etc.) and submits the file as his own work.
2. Student A sends test file and requirements to a person who may be located anywhere in the world. This person completes the test and sends the file back to Student A. Then Student A submits the (“personalized”) work as his own.
3. Student A gives his password to a person who may be located anywhere in the world. This person logs into the system as Student A and completes the test. Then Student A changes his password.

Figure 1: The First Screen

This figure is the screen capture of the Test Guard file. The file contains the single page, which provides short descriptions of the Test Guard tool and a single instruction of its usage.

Because the vast majority of tests require the creation of Microsoft Word documents, the current version of *Test Guard* it designed to prevent and detect plagiarism in case when students should either create a new Word document from scratch, or should complete a test file prepared by the professor. The idea is to “beef-up” the test file with a special software written in VBA – Visual Basic for Applications (Mansfield, R. (2008), Jacobson, R (2002), Albright, C. S. (2001)), which will not have any visual effect on the test file whatsoever i.e. the test file will look like exactly the same before and after “beefing-up”. This hidden software is the backbone of the tool – it prevents and detects possible occurrences of plagiarism. The user of the tool, i.e. the professor giving a test, does not have to know anything about programming at all. The programming is completely hidden from the professor (as well as from the student).

HOW TO PREPARE THE INPUT FILE FOR THE TEST

The *Test Guard* can be used when a professor is providing a partially completed test file in Microsoft Word (input file) and asking students to finish it. If the nature of the test is such that students should create a file from scratch, then *Test Guard* can still be easily used by creating a blank file and asking students to use it for the test. The “*Test Guard*” does its job by adding invisible code to the test’s input file, which prevents various cheating methods, creates report on computers usage for the test, as well as implements some other security features.

Preparing an input file for the test is very simple and takes less than 20 seconds to complete. The professor should open the “*Test Guard.docm*” file, which contains a single page presented in Figure 1. The page contains short descriptions of the tool and one step instruction which tells the user to click on “*No cheating*” button  that was added (by *Test Guard*) to the “Quick Start” menu located in the upper left corner of the screen (see Figure 2). When the button is clicked, a standard “Open” dialog box appears where the user can select the test file. If there is no initial test file, then *Test Guard* will ask the user to enter a name for a blank test file. As soon as the selection is made, i.e. either an existing test file is

Figure 2: A new button in the Quick Start menu

This figure is the screen capture of the Microsoft Word’s Quick Menu after opening the *Test Guard* file. A new button – a red circle with white X, is added which will act as a starting point for test file creation.

selected or a name for a blank test file is provided, the user is asked to enter a password, which will be used to display various statistical information on usage of the test file by a student(s). This is all the professor should do. The input file for the test is now “processed”, i.e., “beefed up” with security features and is ready for distributed to students.

HOW TO CHECK THE TEST FILE FOR DISHONESTY

As it was mentioned above, one of the most important characteristics of this tool is its ability to prevent certain types of plagiarism. When student opens a test file and starts working on it, various “cheating” techniques are disabled. For example, student cannot copy an information from somewhere (from other file, Internet, etc.) and paste it into his or her document because “paste” feature will simply not work! The same is true for inserting a file into the test document. There are several other security measures implemented in *Test Guard*.

All these measures are good tools to prevent cheating on the test, but unfortunately, some student may still try to find ways to cheat – see some possible scenarios described above. The good news is that the same *Test Guard* can not only prevent, but also detect cheating. The professor does not have to do anything extra to use those detection features – they are already implemented in the test document.

This is how it works: when a professor opens the student’s test file, a new line will be added in the “Add-Ins” ribbon (menu item) called “*Any Cheating?*” (If there was no “Add-Ins” then it will be added by *Test Guard*). It acts as a password protected toggle switch, which shows or hides a textbox with statistical information on usage of the test file. It also checks for possible cheating. This information is always displayed on the first page of the test file. Figure 3 depicts a content of the textbox before the processed

test input file has been distributed to students. The first entry in this textbox is related to the professor who created the test and contains the username, computer name and the test creation time.

What May Professor Discover While Checking Student Test Files? – Some Examples

When the test files are submitted by students, the professor may check and see if there was any cheating involved. In order to do so, the professor should unhide the embedded (in the test file) statistical information generated by *Test Guard*. This information is password protected and can be retrieved by selecting the “Any Cheating?” command in the “Add-Ins” menu. Here are some possible types of embedded information.

Example 1. Sam Brown did not cheat

Figure 4 below shows the information which the professor retrieved by clicking the “Any Cheating?” command in the “Add-Ins” menu while checking Sam Brown’s test file. As one can see, Sam Brown honestly took his test on computer station #1356 and completed it at 8:10pm. No cheating was detected.

Example 2. Tom White did cheat

Figure 5 below shows the activity report embedded in Tom White’s test file, which was retrieved by clicking the “Any Cheating?” command in the “Add-Ins” menu. Cheating was detected, because computer names in the second column are different. This informs the professor that Tom got a test file from a student N. Simon, sitting at station 1345. In this scenario, both students who were engaged in cheating are uniquely identified.

Figure 4: Sam Brown did not cheat

No Cheating was detected

twhite	DSKT00001367	6/10/2010 8:12:24 PM

This figure is the screen capture of the activity report, which was embedded in Tom White's test file by **Test Guard**. Cheating was detected.

Example 3. Nancy Brown also cheated

Figure 6 below shows the activity report embedded in Nancy Brown's test file, which was retrieved by clicking the "Any Cheating?" command in the "Add-Ins" menu. In the activity report cheating was detected because computer names in the second column are different. This informs the professor that Nancy sent her test file to Bill Gray, who completed the test and sent it back to Nancy. Then Nancy probably made some cosmetic changes and submitted the file as her own work. In this case Bill Gray could be located anywhere in the world.

Summary

Disappointingly, cheating is widespread on almost all university campuses. As educators, we have to create a learning environment where plagiarism is unacceptable. The **Test Guard** introduced in this study, is yet another tool which can be used toward achieving this ultimate goal. The tool has dual functionality. First, it tries to prevent cheating by disabling various commonly used cheating techniques, such as copy-paste and insert. Second, it implements variety of detection features, which will alarm the professor about

BIOGRAPHY

Dr. Levon Hayrapetyan is a full professor in School of Business at Houston Baptist University (HBU). He earned his BS and MS Degrees in applied mathematics from Yerevan State University, Armenia, and his Ph.D. in theoretical computer science from Kiev State University, Ukraine. Before his tenure at HBU, Dr. Hayrapetyan worked as a research scientist at State University of New York, Health Sciences Center at Syracuse, NY, where he was actively involved in research in the area of computational neuroscience.

INFLUENCE OF ORGANIZATIONAL CULTURE ON ORGANIZATIONAL CITIZENSHIP BEHAVIOR: A THREE SECTOR STUDY

Jagannath Mohanty, Institute of Management Technology, Nagpur
Bhabani P Rath, Berhampur University, Berhampur

ABSTRACT

The modern corporate, unlike the traditional organizations are less structured, less bureaucratic, more flat and people friendly. Manpower has become the single largest differentiator between the 'best' and 'not so best' organizations. Owing to this phenomenon employers have started to expect certain discretionary behaviors out of their employees which fall beyond the purview of workplace requirement and reward systems. All this apparently is to ensure long service periods and bring out the 'Organizational Citizen' within the employee in the organizational context. Since the liberalization in 1991 in India, the industries have gone through a massive change. The Indian companies have also made rapid strides in merging and acquiring foreign companies to improve them and survive in the highly demanding corporate world. The work culture and the mindset of people have also dramatically changed over the past two decades. Therefore the change agent working in a traditional organizational development framework, describing culture is the first step in a rational change process which involves moving an organization from 'here' to 'there'. The present paper is an attempt to examine and investigate the extent of impact that a given Organizational Culture has on Citizenship Behaviors of the employees in an Organization. The study examines the impact of select Culture variables on Organizational Citizenship Behavior across three dominant Organizations representing three sectors of the economy namely, Manufacturing, Information Technology & Banking.

INTRODUCTION

A substantial amount of attention has been paid to the concept of organizational culture in the past several years (Cameron & Freeman, 1991). Likewise, the subject of organizational culture has been considered as one of the central elements that contribute to organizational success. Many scholars (e.g. Deal & Kennedy, 1983, Cameron & Freeman, 1991), in organizational studies assert that when an organization has strong culture and congruence, it is more effective than when it has a weak, incongruent, and disconnected culture. Further, theorists and practitioners alike suggest that improving organizational culture assists in regaining organizational; competitiveness and revitalizing declining organizations (Yeung, Brockbank & Ulrich, 1991). Morgan (2002) explained culture as an active living phenomenon through which people jointly create and recreate the worlds in which they live. Organizational culture provides a framework for using conceptual work and scholarship to improve an organization's effectiveness. (Cameron and Quinn, 2006) found that it is difficult to find a highly successful company that does not have a distinctive, readily identifiable organizational culture because of its powerful effect on performance and long-term effectiveness.

In fact, Organization Citizenship Behavior is those discretionary individual behaviors that employees display which are above and beyond formal role requirements of the workplace and is entirely individual's discretion. They are often described as behaviors that "go above and beyond the call of duty". Not surprisingly, Organizational Citizenship Behaviors are considered to arise, at least in part, from intrinsic motivation including a positive mood state and the need for affiliation or a sense of achievement (Organ, 1988). Derived from Katz's (1964) notion of extra-role behaviors, Organizational Citizenship Behaviors have been defined as "individual behaviors that are discretionary, not directly or explicitly recognized by the formal reward system, and that in the aggregate promote the effective functioning of an organization" (Organ, 1988, p. 4). They represent 'extra effort' by employees that is nonetheless essential

for the effectiveness of the organization, especially where organizational performance is dependent on the interconnectedness and social networks of its people. Though it is not formally recognized by the reward system of an organization, it has the potential to contribute towards improving efficiency and effectiveness of an organization leading to increased competitive advantage.

REVIEW OF LITERATURE: ORGANIZATIONAL CULTURE

The study of organizational culture is not a recent phenomenon (Trice & Beyer, 1993). The beginning studies of culture in organizations can be traced back to the early 1930 Hawthorne studies (Warner & Low, 1947) at the Western Electric Company in Chicago, Illinois. Since the 1980s organizational culture has become very visible in organizational research. The more recent focus on the subject came about in an effort to explain why U.S. firms were having difficulties in competing with organizations from countries with very different cultures, particularly Japan. (Schein, 1990; Trice & Beyer, 1993). From this line of study it was determined that national culture cannot explain all the differences. Instead researchers determined the need to differentiate between organizations within a society, especially in relation to organizational performance and effectiveness (Ouchi, 1983).

Organizational culture has long been regarded as a critical determinant of an organization's effectiveness (Deal & Kennedy, 1982; Peters & Waterman, 1982; Schein, 1992; Ouchi, 1983). Some exceptions have emerged, including influential work by Kotter and Heskett (1992), who found a correlation between indices of "strong" culture (e.g., clearly identifiable, consistent values) and long-term organizational performance. Moreover, research by Denison and his colleagues Denison & Mishra (1995) has afforded great insight and has demonstrated empirical ties between culture and organizational performance in various contexts, using an array of performance criteria. Many researchers have identified relationships between organizational culture, organizational performance and change (Deal & Kennedy, 1982; Peters & Waterman, 1982; Ouchi, 1983).

Researchers have argued that improving, maintaining or changing organization culture assists in making organizations more competitive and in helping revitalize declining organizations. Still, despite this potential importance, organizational culture is still a very controversial area of study among organizational researchers (Quinn & Spreitzer, 1991). Culture has been historically molded (Hofstede *et al.*, 1990) and deeply ingrained in an organization and as a result is difficult to change (Atchison, 2002; Drucker, 1995; Hofstede *et al.*, 1990; Narine & Persaud, 2003; Taylor, 2003). Culture influences the communication skills and decision-making processes of the organization's members and affects its credibility (Cooke & Rousseau, 1988; Kowalczyk & Pawlish, 2002; Mycek, 2000). Organizational culture also shapes the organization's level of socialization and learning (Cooke & Rousseau, 1988).

Kowalczyk & Pawlish (2002) correlated the importance of culture to an organization's competitive advantage, adaptability, and level of innovation. It has been further noted that the culture of an organization may affect organizational system operations, productivity, leadership actions (Shaw, 2002; Taylor, 2003), performance (Cameron & Quinn, 1999), and organizational effectiveness (Parry, 2004; Valentino *et al.*, 2004). Research has shown that culture has influenced employees' commitment (Lok & Crawford, 1999; Mycek, 2000; O'Reilly, 1989; Parry, 2004; Putz, 1991; Webster, 2004) and behaviors (Atchison, 2002; Cooke & Rousseau, 1988). It has been further noted that the culture of an organization may affect organizational system operations, productivity, leadership actions (Shaw, 2002; Taylor, 2003), performance (Cameron & Quinn, 1999), and organizational effectiveness (Parry, 2004; Valentino *et al.*, 2004). Research has indicated that culture has influenced employees' commitment (Lok & Crawford, 1999; Mycek, 2000; O'Reilly, 1989; Parry, 2004; Putz, 1991; Webster, 2004) and behaviors (Atchison, 2002; Cooke & Rousseau, 1988). The change in organizations is pervasive due to the amount of change in the external environment (Cameron & Quinn, 1999). Culture emerges as people within organizations learn how to deal with these changes or uncertainties. It gives them accepted ways of expressing and

affirming their beliefs, values and norms (Trice & Beyer, 1993). In short, “cultures are a natural outgrowth of the social interactions that make up what we call organizations” (Trice & Beyer, 1993,).

REVIEW OF LITERATURE: ORGANIZATIONAL CITIZENSHIP BEHAVIOR

Organizations that employ individuals who exhibit Organizational Citizenship Behaviors are more likely to have effective work groups within the organization (Podsakoff, Ahearne, & Mackenzie, 1997). Empirical studies on Organizational Citizenship Behaviors have been conducted in various industries, including sales (Mackenzie, Podsakoff, and Fetter, 1993; Podsakoff & Mackenzie, 1994), education (Somech et.al, 2004), communications, Podsakoff et.al 1990), and banking (Wheatley, 2002). Organizational Citizenship Behavior research has also expanded across the globe, with studies being conducted in organizations in countries other than the United States. Organizational Citizenship Behaviors have been studied in organizations in Canada (Latham & Skarlicki, 1996), Taiwan (Farh, *et al.* 1990), China (Farh, Zhong, & Organ, 2004), and Israel (Somech & Drach-Zahavy, 2004). (Chhokar, Zhuplev, Fok, and Hartman 2004) conducted a study on Organizational Citizenship Behavior that expanded across the boundaries of five different countries. They examined Organizational Citizenship Behavior in France, Britain, India, Russia, and the United States and found that in all there has been an impact of Organizational Citizenship Behavior.

Organizations facing increasing competition and uncertain environments are moving from bureaucratic structures to new organizational forms characterized as flat. Networked, uncertain, flexible, and decentralized (Ancona, Kochan, Scully, Maanen, & Westney, 1996). Traditional task-based jobs, comprised of fixed packages of similar tasks, have been “unbundled” into “broader chunks of work that change over time” (Cascio, 1995), resulting in more ambiguous work roles. To function effectively, it is not enough for an organization to “depend solely upon its blueprints of prescribed behavior” (Katz, 1964). Organizations have accordingly been relying increasingly on their employees’ willingness to contribute beyond formal job descriptions and on their leaders to inspire an empowered workforce.

Organizational citizenship behavior, originally conceptualized as extra-role behavior were valued by the organization but not explicitly recognized by formal reward systems (Organ, 1988), and leader-member exchange (Graen & Scandura, 1987), have much to offer for the effective functioning of these new forms of organizations. Considerable empirical evidence has converged on the finding that Organizational Citizenship Behaviors have a significant impact on managerial performance appraisals and other managerial decisions (Allen & Rush, 1998; Avila, Fern, & Mann, 1988; Borman, White, & Dorsey, 1995; Conway, 1999; Johnson, Erez, Kiker, & Motowidlo, 2002; Kiker & Motowidlo, 1999; Lowery & Krilowicz, 1994; MacKenzie, Podsakoff, & Fetter, 1991, , 1993; MacKenzie, Podsakoff, & Paine, 1999; Motowidlo & Van Scotter, 1994; Orr, Sackett, & Mercer, 1989; Rotundo & Sackett, 2002; Van Scotter & Motowidlo, 1996; Werner, 1994). In some cases, these findings indicate that citizenship behaviors have substantially greater influence on performance appraisals than objective performance information (Lowery & Krilowicz, 1994; MacKenzie *et al.*, 1991, 1993; MacKenzie *et al.*, 1999). A smaller set of studies has investigated the influence of citizenship behaviors on other managerial decisions.

Orr *et al.* (1989) investigated the relative impact of contextual and task behaviors on supervisor ratings of the monetary value of employee contributions at work. Results indicated that contextual behaviors explained significant variance in Standard Deviation estimates, beyond what is explained by task behaviors alone. Additionally, Kiker and Motowidlo (1999) found that both contextual and task performance significantly influenced supervisor reward allocation decisions. In a military sample, Van Scotter, Motowidlo and Cross (2000) demonstrated that contextual performance explained significant additional variance beyond task performance in rewards such as medals received, promotability ratings, and informal rewards.

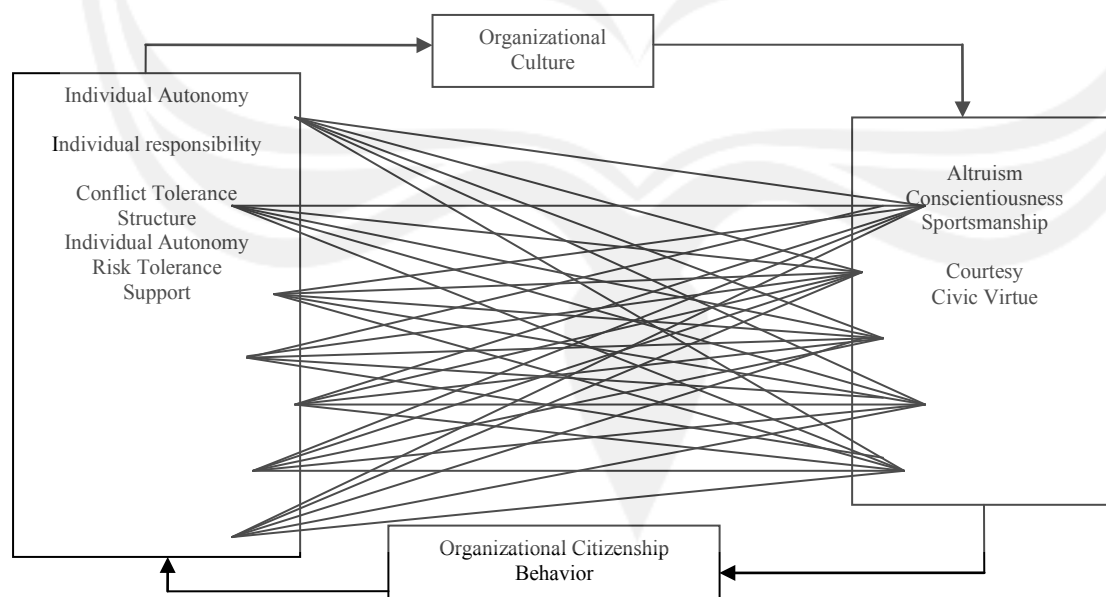

METHODOLOGY

In this study a specially designed Questionnaire was adopted to measure the employee's perception on different aspects of the study. The Questionnaire used in the study is designed taking into account different theories and models of Organizational Culture & Organizational Citizenship Behavior. The instrument consists of statements evaluated on a three point rating Scale. The three varied scale of Rating Behavior of employees were Yes, No & Can't say. The questionnaires were distributed to the 550 employees working in the Organizations under study. The total no of questionnaires received was 380 representing a rate of return of 69 percent. Further out of the 380 questionnaires returned another 36 questionnaires were rejected owing to a high rate of missing data. Hence, the complete survey data came to 344 which represent 62 percent of the total questionnaires, which is being used for the final analyses. The survey instrument comprised of a total of 54 questions excluding the demographic questions. There were a total of 30 questions devoted to Organizational Culture and 24 questions to Organizational Citizenship Behavior. The survey involved Organizations representing three different sectors namely, The Modern Private Banking Organization, The modern Information Technology Organization and the Traditional Manufacturing Organization.

Table 1: The Variables

Organizational Culture:	Organizational Citizenship Behavior:
<ul style="list-style-type: none"> • Belief & Norms • Individual Autonomy • Individual responsibility • Conflict Tolerance • Structure • Risk Tolerance • Support 	<ul style="list-style-type: none"> • Altruism • Conscientiousness • Sportsmanship • Courtesy • Civic Virtue

Figure 1: The Model

Hypothesis

H1 – There would be a significant positive relationship between Organizational Culture and Organizational Citizenship Behavior

H2 – The factors of Organizational Culture & Organizational Citizenship Behavior will differ across the Organizations.

FINDINGS

To test the hypothesis (H1) correlation was done. The results derived indicated a high positive correlation between Organizational Culture and Organizational Citizenship Behavior ($r = .722$, $p < .01$) across all the Organizations (Manufacturing, IT, Banking). The results also demonstrated a significant level of correlation between Organizational Culture and Organizational Citizenship Behavior in the individual Organizations as well. For the banking Organization the correlation was significant ($r = .626$, $p < .01$), similarly for the IT organization the correlation was also significant ($r = .635$, $p < .01$), again for the manufacturing sector the correlation was found to be ($r = .764$, $p < .01$) higher than the average of all the sectors and highest among the three Organizations under study (Table 2). Hence the hypothesis is accepted.

Table 2: Correlation between OC & OCB across All Organizations

Organization	N	Correlation
Total (Manufacturing, IT, Banking)	343	.722**
Banking Organization	51	.626**
IT Organization	89	.635**
Manufacturing Organization	202	.764**

** Correlation is significant at the 0.01 level (2-tailed)

It was observed from the analysis that there was a significant correlation between all the variables (OC: Belief & Norms, Individual Autonomy, Individual responsibility, Conflict Tolerance, Structure, Risk Tolerance, and Support. Organizational Citizenship Behavior: Altruism, Conscientiousness, Sportsmanship, Courtesy and Civic Virtue). It was observed that despite the fact that study was conducted in three diverse organizations, yet there was a significant relationship among the variables across the Organizations, notwithstanding that the culture and practices prevalent in respective Organizations are different. Also it was inferred that the degree of difference of correlation between the Organizations was not very significant i.e. (Banking, IT and Manufacturing). The uniformity may be attributed to a strong conformity to culture in each of the Organization. In addition it may also be, that each of these Organizations values their culture and attach high significance to it. Therefore conformity to culture in these Organizations is obvious and as such, has significant correlation with Organizational Citizenship Behavior Variables. Hence, it is needless to say that citizenship behavior attributes in these Organizations is a result of healthy Organizational Culture practices, which are dear to every employee working. Among organizations, the manufacturing organization scored slightly over others. The reason could be the uniformity in pay and privileges, equal opportunities and job security, that is typical about Manufacturing Organizations, that keep the employees more committed to the culture, that results in overall better score in Organizational Citizenship behavior.

In this hypothesis (H2) it was assumed that each variable in Organizational Culture will positively impact the Organizational Citizenship Behavior, across all the organizations and also in the individual organizations. For this purpose correlation was conducted to establish the impact of Organizational

Culture on Organizational Citizenship Behavior. It was observed that across the organizations and also in individual organizations, the correlation was positive from high to moderate levels (refer Table 3). Belief & Norms had a positive correlation with Altruism, at ($r = .47, p < .01$), with Sportsmanship, at ($r = .48, p < .01$), Civic virtue, at ($r = .52, p < .01$), with Conscientiousness at ($r = .57, p < .01$), with courtesy, at ($r = .48, p < .01$). It can also be seen that Individual responsibility had a positive correlation with Altruism at ($r = .46, p < .01$), with sportsmanship, at ($r = .40, p < .01$), with Civic Virtue, at ($r = .51, p < .01$), with Conscientiousness, at ($r = .48, p < .01$), with Courtesy, at ($r = .38, p < .01$). It was further established that Structure had a significant positive relationship with Altruism, at ($r = .43, p < .01$), with Sportsmanship, at ($r = .47, p < .01$), with Civic Virtue, at ($r = .40, p < .01$), with Conscientiousness at ($r = .52, p < .01$), with Courtesy, at ($r = .43, p < .01$). It was further established that Individual autonomy had a positive moderate correlation with all variables, with Altruism, at ($r = .32, p < .01$), with Sportsmanship, at ($r = .23, p < .01$), with Civic Virtue, at ($r = .26, p < .01$), with Conscientiousness at ($r = .27, p < .01$), and with Courtesy, at ($r = .26, p < .01$). Again it was observed that Conflict tolerance was positively correlated with other variables, with Altruism, at ($r = .43, p < .01$), with Sportsmanship, at ($r = .36, p < .01$), with Civic Virtue, at ($r = .46, p < .01$), with Conscientiousness, at ($r = .50, p < .01$) and with Courtesy, at ($r = .41, p < .01$). Also on inference it was established that Support was positively correlated with other variables, with Altruism, at ($r = .53, p < .01$), with Sportsmanship, at ($r = .52, p < .01$), with Civic Virtue, at ($r = .62, p < .01$), with Conscientiousness, at ($r = .58, p < .01$) and with Courtesy, at ($r = .58, p < .01$). Similarly on analysis it was observed that Risk Tolerance was positively correlated with other variables, with Altruism, at ($r = .37, p < .01$), with Sportsmanship, at ($r = .40, p < .01$), with Civic Virtue, at ($r = .36, p < .01$), with Conscientiousness, at ($r = .39, p < .01$) and with Courtesy, at ($r = .29, p < .01$). Therefore the hypothesis is accepted.

Table 3: Correlation Of OC & OCB Variables Across All Organizations

	Altruism	Sportsmanship	Civic	Conscientiousness	Courtesy
Belief & Norms	.47**	.48**	.52**	.57**	.48**
Individual Responsibility	.46**	.40**	.51**	.48**	.38**
Structure	.43**	.47**	.40**	.52**	.43**
Individual Autonomy	.32**	.23**	.26**	.27**	.26**
Conflict Tolerance	.43**	.36**	.46**	.50**	.41**
Support	.53**	.52**	.62**	.58**	.58**
Risk Tolerance	.37**	.40**	.36**	.39**	.29**

** Correlation is significant at the 0.01 level (2-tailed).

It was hypothesized that each variable in Organizational Culture will significantly influence the Organizational Citizenship Behavior across all Organizations and also for each of the Organization. This hypothesis was accepted. It was evident from the analysis that each variable was significantly correlated to the other variable, across all Organizations. When compared it was apparent that Support had most significant correlation with other variables viz. Altruism, Sportsmanship, Civic Virtue, Conscientiousness and Courtesy, of this Civic Virtue scored the highest. The reason for such results could be the cultural conformity in Organizations and positive impact of culture towards peer support. Particularly for the Civic Virtue could be the respect that, employees have for the rules and regulations of the Organization.

DISCUSSION

Having studied the Organizational Culture of three different Organizations it can be concluded that there are certain factors which are related to the Culture practiced in a Workplace and which have got lot to do with inculcating the Organizational Citizenship Behavior amongst the employees. This is found to be

more or less the same for all the Organizations surveyed, because these factors form the basic concept of Organizational Citizenship for any Organization. It can be hence speculated that strengthening the cultural roots of an Organization can lead to observance of Citizenship Behavior across all sectors in a given Organization.

RISKS AND OPPORTUNITIES IN THE CHINESE STOCK MARKET

Anthony Mounq Yin Chan, Ryerson University

ABSTRACT

Direct holding of shares of enterprises in the People's Republic of China (PRC) by foreign investors has been made possible since shares were first traded on the Shanghai Securities Exchange and the Shenzhen Stock Exchange in 1992. As a foreign investor, one should look into the regulatory framework governing the operation of the PRC stock market, and the risks involved. This paper analyzes the risks, opportunities and future prospects of the stock market in the PRC from the foreign investors' viewpoint. One major part of this study is a critical review of the current institutional framework concerning investor protection and the operation of the PRC stock market. Other risks such as deviation of the PRC accounting standards from International Accounting Standards, insufficient communication facilities, foreign exchange risk, economic risk, political risk and low liquidity are also discussed.

ABSTRACT

This paper investigates the determinants of capital structure using dataset from 33 listed and non-listed companies during the period 2003 – 2007 in Ghana. A multiple regression analysis of pooled-cross sectional and time-series observations has been employed in the analysis. The results identify long-term debt to be irrelevant component of capital structure of large unquoted and quoted firms in Ghana. Furthermore, Ghanaian companies' profitability, size, business risk and tangible assets have positive correlation with level of gearing. On other hand, growth, and tax indicate a negative correlation with the level of gearing.

KEYWORDS: Capital structure, financing decisions, listed, non-listed, Ghana.

INTRODUCTION

The empirical research into how firms are financed has been predominantly focused on the United State and other developed countries. Among such literatures are; Modigliani and Miller (1958), Myers (1977), Titman and Wessels (1988), Rajan and Zingales (1995), and Wald (1999) Bevan and Danbolt (2000 and 2002), Antoniou *et al.*, (2002), Hall *et al.*, (2004). Aivazian, Demirguc-kunt and Maksimovic (2001) made a comparative study of capital structure policy in ten developing countries. In addition, other research in respect to developing countries has been carried out by (Pandey, 2001; Chen, 2004; Omet and Nobanee, 2001 and Deesomsak *et al.*, 2004). Both researches concluded that there are similarities in the determinants of capital structure in developed and developing countries.

However, studies in Ghana examined the determinants of capital structure of Ghanaian firms by comparing the capital structures of quoted firms, large unquoted firms, and small and medium enterprises (SMEs) (Abor, 2004; Abor and Biekpe, 2005a, 2005b, 2006; Abor 2007, 2008). This study takes a slight paradigm shift, in that it strategically focuses on both large quoted and unquoted firms in Ghana. The justification is that to date to the best of our knowledge literature on the factors that influence capital structure in developing countries is scanty. The paper therefore attempts to add to literature by answering the following research questions:

RQ1-What are the determinants of capital structure in Ghanaian firms?

RQ2-What is the influence of macro-economic factors on the level of corporate funding in the Ghanaian context.

Finally, the study seeks to develop an empirical model to underpin the capital structure behaviour of quoted and unquoted firms in Ghana. The rest of the paper is organised as follows: Section two provides a review of the existing literature. Section three includes the research methodology, while section four includes discussion on the empirical results. Section five concludes the discussion.

LITERATURE REVIEW

The theoretical and empirical studies have revealed that capital structures chosen by companies are based on the agency cost of debt to equity (Jensen and Macklin 1976, Harris and Raviv 1991). The main determinants of capital structure according to Harris and Raviv (1990) are; tangibility, non-debt shields, growth opportunities, volatility, profitability, tax and size. These variables influence the ratio of capital structure. Furthermore, Harris and Raviv (1990), in their studies on US firms suggest that leverage increases with fixed assets, non-debt tax shields, investment opportunities and firm size and decreases with volatility, advertising expenditure, bankruptcy, profitability.

Abor and Biekpe (2005) indicated that, total debt constitutes more than half of the capital of listed firms in Ghana. The results also show positive association between debt ratios (Capital structure) and firm size and growth, while asset tangibility, risk, corporate tax and profitability are negatively related to debt ratio. The results generally support the pecking order theory proposed by the theoretical model.

Previous studies have confirmed that a firm with lower tangible assets will pay high cost of debt compared to a firm with high fixed assets (Ryen and Vasconcellos 1997, Williamson, 1988 and Titman 1984). Other studies also assert that tangible asset is positively correlated to leverage and most of these studies were based on developed countries (Harris and Raviv (1990), Rajan and Zingales (1995) and Wald (1999), Friend and Lang (1988) and Long and Maritz (1985). However, Wiwattanakantang (1999), Um (2001), Booth et al, (2001), Huang and Song (2002) researched on developing countries and found out that tangible asset is negatively related to leverage. Moreover, Bevan and Danbolt (2000) suggest positive correlation between assets and long-term debt. Alternatively, the relationship between tangible asset and short-term debt is negative correlated.

Profitability is the returns from the operations of the companies; the returns are determined by the amount of investment, type of investment, macro-economic environment and gearing of the company. Empirical and theoretical studies on this area have given mixed reactions about the relationship between profitability and leverage. Kester (1986), Rajan and Zingales (1995) Titman and Wessel's (1988) and Toy *et al.* (1974) suggest profit to be correlated negatively to leverage. Modigliani and Miller (1963) were of the opinion that companies will prefer debt capital because of the tax shield on interest. On the other hand, tax shield from depreciation and other provisions will discourage some management to arrange for debt capital according to DeAngelo and Marsalis (1980). Furthermore, Myers and Majluf (1984) on the pecking order theory of capital structure assume that information asymmetry causes companies to prefer internally generated funds to other sources of finance.

The share price is an important determinant of capital structure because it determines the amount of equity capital that is available to management. The trading on the stock market is influenced by factors such as the state of the economy, inflation, interest rate, consumer disposable income and wars. Barclay and Smith (1995) suggest that a firm with high intangible asset will borrow at higher cost and a firm with high tangible assets can use the assets as collateral hence borrow at cheaper cost.

The size of a company is determined by the turnover and the number of employees. Larger firms tend to choose long-term debt and smaller companies choose short-term debt (Marsh, 1982). The size of a firm plays a vital role in negotiation for debt. Larger firms can negotiate for long-term debt because they can have influence on the creditors. In addition, large firms are more diversified than small firms are and have a more stable cash flow. The previous studies into size in relation to capital structure have given mixed reactions. According to Rajan and Zingales (1995), the effect of size on equilibrium leverage is more ambiguous. Larger firms tend to be more diversified and fail less often, so size may be an inverse proxy for the probability of bankruptcy.

The level of information disclosure is very high in big firms compared to the smaller firms. For example, big firms are obliged by law to publish and disclose information based on the standards and regulations. On other hand, small companies are not under any obligations and regulations. Fama and Jensen (1983) and Friend and Lang (1988) argue that large firms tend to provide more information to lenders than small firms. Managers prefer to finance investment by equity capital because of asymmetric information cost and this in effect makes leverage negatively correlate to size of company.

The Modigliani and Miller (1958) theory on capital structure omitted the essence of taxation in corporate finance. M&M went back to the drawing board and came up with revised theory incorporating corporation tax in 1963. The implication of taxation in corporate financing is that the firm with debt capital would pay less corporate tax. This is because the annual cash flow advantage for geared company equals interest paid on debt multiplied by corporate tax rate. M&M argues that the value of equity plus debt in geared company is greater than value of equity in an equivalent all equity financed company. The main conclusion of M&M (1963) hypothesis is that all companies should gear up to 99.9% debt to maximise shareholders wealth, because every time debt is issued the shareholders benefit owing to the increased value of the tax shield generated by debt. They maintain further that firms seeking sources of finance for investment purposes should not show any preference for internal sources over external finance. In addition, sources of financing firms should not be influenced by the availability of internal finance but should only be governed by the availability of profitability investment opportunities.

Conversely, the limitations and associate cost with debt and equity funding has called for other sources of financing for firms. Most theories have sought to explain capital structure by introducing frictions omitted in the Modigliani and Miller framework (Taggart, 1989). The static trade-off model (Myers, 1977) emphasised that capital structure is determined by the agency cost of financial distress and the tax-deductibility of debt finance. The problem of agency cost has been emphasised by Jensen (1986) in his Free Cash Flow theory and formally modelled by Stulz (1990). Alternatively, Myers and Majluf (1984) emphasise in their pecking order model that the friction due to asymmetric information between managers and outside investors influences firms to prefer internal funds to external funds. Thus, there exists a financial hierarchy descending from internal funds, to debt, and to external equity (Greenwald, Stiglitz and Weiss, 1984).

In summary, the previous studies by Rajan and Zingales (1995), Bevan and Danbolt (2000 and 2002), Titman and Wessels (1988) and Harris and Raviv (1991), were unable to come to consensus on the appropriate type of capital structure and they have different findings on their studies. This study has taken into account strengths and weaknesses of previous studies and it has been observed that macro-economic and political factors play a key role in determining the capital structure globally. For example, if firms typically issue stock when their price is high relative to book value, the correlation of the capital structure will be affected (Korajczk, Lucas, McDonald, 1991; Jung, Kim, and Stulz, 1994).

DATA AND METHODOLOGY

The data set used in the analysis is constructed by merging companies' statement of financial position, cash flow and comprehensive income for the period 2003 to 2007. It is generally recognised under Central Limit Theorem that in a sample of 30, distribution is approximately normal and the results statistical tests performed are meaningful (Grinstead and Snell, 2000). However, in this study, the sample will be limited to only 33 companies.

The multiple regression model formula given below was used to calculate the relationship between the dependent variable and independent variables (Rajan and Zingales, 1995; Booth *et al.*, 2001).

$$Gea_i = \bar{A} + \beta \bar{W}_1 Pro_i + \beta \bar{W}_2 Asset_i + \beta \bar{W}_3 Size_i + \beta \bar{W}_4 Risk_i + \beta \bar{W}_5 Gro_i + \beta \bar{W}_6 T_i + \hat{\epsilon}$$

Where:

Gea_i (Gearing)	=	Long-term debt/ capital employed
\hat{A}	=	Intercept coefficient
β	=	Slope coefficient for independent variable
$\hat{W}_1 \text{Pro}_1$ (Profitability)	=	Earning before interest and Tax / Total assets
$\hat{W}_2 \text{Asset}_1$ (Tangible assets)	=	Net fixed assets / Total assets
$\hat{W}_3 \text{Size}_1$ (Size of company)	=	Log of sale value
$\hat{W}_4 \text{Risk}_1$ (Business risk)	=	percentage change in operating profit
$\hat{W}_5 \text{Gro}_1$ (Growth)	=	Percentage change in total assets
$\hat{W}_6 T_1$ (Tax)	=	Operating income after interest and tax payments to total assets.
\hat{e}	=	Regression error terms.

The regression analysis was carried out between the dependent variable (debt) and the independent variables such as; tangible assets, profitability, size of firm, growth opportunities, and business risk and non-debt tax. Data for this study are pooled cross sectional and time series observation. Specifically, data for the six variables (assets tangibility, profitability, company size, growth opportunity, volatility, and taxation) for thirty-three (33) Ghanaian companies were collected for the period of 2003-2007, representing 198-pooled observations (1188 data points).

EMPIRICAL RESULTS

Descriptive statistics: Table 4.1 below provides descriptive statistics information for the full sample of the companies. The mean debt ratio (measured by total debt to total capital) of the sampled companies is 28%, and median is 23%. This implies that equity financing represents 72% contrary to Dermirguc-Kunt and Maksimovic (1999), and Abor and Biekpe (2005b). Company size, determined as the natural logarithm of turnover, had a mean and median of 13.273 and 13.298 respectively. Asset tangibility had a mean of 0.582. This indicates that, on the average, fixed assets accounted for 58.20% of total assets. Profitability, given as the ratio of EBIT to total assets, registered a mean value of 0.1215 suggesting a return on assets of 12.15%. Risk is measured as the variability of EBIT and this showed a mean (median) of -0.5900 (-0.1330). The mean for growth (measured as growth in total assets) was 0.1130. This indicates that, on average, growth rate in total assets was 11.30% during the five-year period. Corporate tax rate on average was 7.39%

The output generated from the multiple regression has been summarised in table 4.2 below. It can be deduced from the table that the *R* Square values in model 1 explains 55.4% (0.554×100) of the variance. The *R* square change value of 55.4% means that the independent variable explains 55.4% of the variance in dependent variable. This is statistically significant contribution as indicated by the Sig. F Change value (0.001). Furthermore, the Adjusted *R* Square of 45.1% explains the power in the variation in the firm's financial level. Therefore, approximately 45.1% of the variation in the firm's level of finance can be explained by the six independent variables in the model. This explanatory power is comparable to that obtained by Rajan and Zingales (1995) and Bevan and Danbolt, (2000, 2002).

b. Dependent Variable: Debit ratio

The ANOVA table 4.3 below contains an output analysis that tests whether the model is as a whole is significantly better at predicting the outcome than using the mean as a best guess. From the table below it can be said that this analysis is significant because the P-value of 0.001 is less than the alpha level of 0.05.

a. Dependent Variable: Debt ratio

Profitability Ratios: ($\beta = 0.089$): Profitability coefficient indicates that for every unit increase in profitability there is a 0.089 unit increase in gearing. Increasing profitability may denote efficient management and could attract investors in the short run. On other hand, high profitability in the long run denotes high retain earnings to finance additional investment. The result from this study is that profitability is positively correlated to gearing and this is inconsistent with pecking order theory by Myer and Majluf (1984), Rajan and Zingales (1994), Abor and Biekpe (2005). However Long and Maltiz (1985) suggest positive correlation between profitability and leverage. Wald (1999) “profitability has the largest single effect on debt to assets ratios. Profitability is technically not significant because p-value of 0.068 is significantly greater than 0.05. The standardised coefficient of Beta (*standardised* $\beta = 0.062$) indicates that as profitability increases by one standard deviation (0.1666), gearing increases by 0.062 standard deviations. The standard deviation for gearing is 0.2386 and so this constitutes a change of 0.01479 profits (0.2386 x 0.062).

Assets Tangibility: ($\beta = 0.072$): This ratio indicates that for every unit increase in assets tangibility there is corresponding increase in gearing. This implies that there is positive relationship between assets tangibility and gearing. These empirical findings confirm Rajan and Zingales (1995). Firms with high assets can use their assets as collateral to secure debt finance at less cost. In addition, increasing volume of assets denotes high operating efficiency, and this could attract investors. This is not statistically significantly different from zero, because p-value of 0.396 is significantly greater than 0.05. The standardised coefficient of Beta (*standardised* $\beta = 0.124$) indicates that as assets tangibility increases by one standard deviation (0.4144), gearing increase by 0.124 standard deviations. The standard deviation for gearing is 0.2386 and so this constitutes a change of 0.0295 assets tangibility ratio (0.2386 X 0.124). The interpretation is said to be true if all other independent variables are held constant. The results suggest that, for Ghanaian firms, a higher proportion of fixed assets lead to the use of more debt financing because of availability of collateral.

Company Size (logsales): ($\beta = 0.002$): The results indicate a statistically significant positive relationship between size and leverage. The results suggest that the bigger the firm, the more debt it will use. One reason is that, larger firms are more diversified and hence have lower variance of earnings, making them

able to tolerate high debt ratios. Lenders are more willing to lend to larger companies because they are perceived to have lower risk levels. On the other hand, smaller firms may find it relatively more costly to reduce information asymmetries with lenders, thus, they tend to have lower debt ratios. This variable indicates that as company size increase by unit of percentage, gearing increase by 0.002 percent. The standardised coefficient of Beta (*standardised β* = 0.019). This indicates that as a company size increases by one standard deviation (2.085) gearing increases by 0.019 standard deviations. The standard deviation for gearing is 0.2386 and so this constitutes a change of 0.0045 percent of company size (0.2386 X 0.019). Therefore, for every 23.86% increase in gearing 4.5% is influenced by company size, holding other variables constant. This variable is statistically not significant, because with coefficient of 0.002 the p-value of 0.901 is greater than the alpha level.

Business Risk (β = 0.026): The results indicate that for every increase in business risk there is corresponding increase in gearing. Investors are generally risk averse. That is, the higher the risk, the higher the expected returns they seek and hence the increase in gearing. In addition, debt instruments have lower level of risk than equity. This is because debt holders are the first to be paid in case of liquidation. Business risk is statistically not significant because the coefficient of 0.026 has p-value of 0.435 which is greater than alpha level 0.05. This variable shows a positive relationship between business risk with gearing Titman and Wessels (1988). The standardised coefficient of beta (*standardised β* = 0.112) indicates that as a business risk increases by one standard deviation (0.9095), gearing increases by 0.112 standard deviations. The standard deviation for gearing is 0.2386 and so this constitutes a change of 0.0267 percent of business risk (0.2386 X 0.112). Therefore, it can be deduced that for every 23.86% change in gearing, the business risk contribute 2.67% if all the other independent variable are held constant.

Growth (β = -1.074): The results indicate a statistically significant negative relationship between growth and leverage (Kester, 1986; Titman and Wessels, 1988; Barton *et al*, 1989). One reason is that, growth in the short-run puts much pressure on retained earnings according to the pecking order theory. However, the long run effect would be that management would seek for external sources of funds to finance the increasing growth opportunities. This coefficient indicates that for every increase in growth, a decrease of 1.074 in the level of gearing is predicted, holding all other independent variables constant. Growth is statistically significant from zero because with the coefficient of 1.072 the p-value of 0.000 is less than the alpha level. The standardised coefficient of beta (*standardised β* = -0.706) provides that as growth increases by one standard deviation (0.1568), gearing decreases by -0.706 standard deviation. The standard deviation for gearing is 0.2386, so this constitute a change of 0.168, (0.2386 X 0.706) percent of the growth. This can be interpreted that for every 23.86% change in gearing, growth constitutes approximately 16.80%. In another development, the empirical evidence regarding the relationship between gearing and growth opportunities is rather mixed. While Titman and Wessels (1988), Chung (1993) and Barclay *et al*. (1995) find a negative correlation, Kester (1986) does not find any support for the predicted negative relationship between growth opportunities and gearing. However, in this study growth indicates a negative correlation to gearing.

Tax (β = -0.335): The unstandardised coefficients indicate that for every increase in non-debt tax shield, a -0.335 decrease in the level of gearing is predicted, holding all other variables constant. The results provided show that corporate tax is negatively correlated with gearing. The relationship could be attributable to the special tax rebate for listed firms. Firms that go public tend to enjoy tax reduction compared to unlisted firms. Companies have an incentive to get listed given the tax incentive they receive. Thus, a general increase in corporate tax would be associated with increasing equity capital since firms would be encouraged to go public and enjoy the special tax rebate.

This variable is statistically not significant predictor variable in the regression model because with coefficient of -0.333 the p-value of 0.325, is greater than the alpha level. Therefore the standardised coefficient of beta (*standardised β* = -0.144) indicates that as non-debt tax shield increase by one standard deviation (0.1029), gearing decrease by -0.144 standard deviation. The standard deviation of gearing is 0.2386, so this constitutes a change of -0.0343, (0.2386 X -0.144) percent of this variable. The implication of this analysis is that for every 23.86% change in gearing, non-debt tax shield influences it by 3.34%.

The regression results of aggregate sample also show that there is positive relationship between gearing and profitability, the coefficient for the profitability variable is found to be positive and not significant ($t=0.417$, $p=0.680$). The coefficient of company size is also found to be positive and not significant ($t=0.126$, $p=0.901$). In addition, tangibility and business risk have positive correlation and not significant with the following ($t=0.863$, $p=0.395$) and ($t=0.793$, $p=0.435$) respectively. These results show that profitability, and company size are positively correlated and not significant. However, tangibility and business risk have positive correlation and not significant meaning that there is a positive relationship between gearing of Ghanaian companies and tangibility, and business risk. On other hand, growth, and taxation have coefficients of ($t=-4.714$, $p=0.000$), ($t=-1.003$, $p=0.325$) respectively. This also implies that the correlation of these independent variables is negatively correlated with gearing in Ghanaian companies, and growth opportunity is statistically significant because the p-value is less than 0.05.

The results for the overall sample are consistent with some of the findings in the previous studies (see chapter three) particularly with the result of Rajan and Zingales (1995), Titman and Wessels, Abor (2008).

SUMMARY, CONCLUSIONS AND POLICY RECOMMENDATIONS

The study examined the determinants of capital structure of large unquoted and quoted firms in Ghana. The study revealed that long-term debt is an unimportant component of the capital employed of unquoted and quoted firms in Ghana. The results from the multiple regression model identified profitability, tangibility, company size, and business risk to be positively correlated with gearing and not significant, some of these findings are comparable to those obtained by Kaplan and Zingales (1997), Rajan and Zingales (1995), and Abor and Biekpe (2005). Whilst growth opportunities, and taxation correlated negatively with the level of gearing, and business opportunity is statistically significant.

The studies conducted by Abor and Biekpe (2005) on twenty-two listed companies in Ghana revealed that Size, Tangibility, Profitability, Risk, and Taxation are statistically significant while Growth is statistically insignificant. This is inversely related to the result of this study, the findings revealed, Size, Tangibility, Profitability, Risk, and Taxation are statistically insignificant while Growth is statistically significant. These statistical differences between the present study and the aforementioned might have resulted partially to our sources of data, sample size and time (duration of studies).

The above difference notwithstanding, the Government of Ghana should take into account the need to improve the long-term external sources of funds, especially to improve the bond market in Ghana. Also high rate of government bonds encourage Ghanaians, investors and other financial institutes to invest in government bond rather than corporate investment because of the low risk associated with the government bond investment. Therefore, an interesting future research on the impact of asymmetric information on determinants of capital structure in Ghana is inevitable.

CONSUMER ETHNOCENTRISM: INVESTIGATING CONSUMER ATTITUDE TOWARDS MADE IN GHANA GOODS

Bylon Abeeku Bamfo, KNUST School of Business

ABSTRACT

The attitude of the people living in a particular country towards the goods and services produced within that country goes a long way to determine the economic growth and development that country. The study investigated the attitude of respondents towards made in Ghana goods. A sample size of 500 was selected. Respondents were randomly selected. The main instrument which was used in collecting data was structured questionnaires. It came to light that although there is some element of ethnocentrism among respondents; they are not highly ethnocentric. It was recommended that the industries in the country should increase the quality levels, reduce prices and make available more goods to compete favourably with those from abroad.

KEYWORDS: Consumer, Ethnocentrism, Attitude, Domestic, Foreign Goods

INTRODUCTION

Ghana as a developing country is leaving no stone unturned to become a middle income country by the year 2020. This is a step in the right direction since Ghana cannot afford to remain at where it is now if it wants to compete favourably with the rest of the world and to better the lot of her citizens (www.ghana.gov.gh). In her quest to become a middle income country, Ghana cannot afford to depend on other countries for a chunk of its products to feed the domestic market. Most countries that have developed and have achieved their objectives have depended so much on local production and the campaign of government in support of the consumption of domestic goods (Elliot & Cameron 1994). The level of commitment to local products depends to a large extent on ethnocentrism (Sciffman & Kanuk 1997).

The Ghanaian government has come out with the idea of national orientation. The first of the five concepts and pillars of this orientation is 'Proud to be Ghanaian'. This concept emphasizes the need for Ghanaians to take pride in their national heritage and also to take pride in those things Ghanaian and patronise made-in-Ghana goods (www.ghana.gov.gh).

It has been recognised in the international and national markets over the centuries and has been generalised that consumers have either positive or negative feelings towards products depending on how they perceive quality, accessibility, security, warranty, goodwill and some other factors (Watson & Wright 2000). There is also the issue of positive bias as well as negative bias. Negative bias is in the form of dislike for foreign products (Sharma & Shimp 1987). Consumers may also have positive bias towards products. This has to do more with products that are coming from countries that are culturally similar to the home country (Heslop et al 1998, Lantz & Loeb 1996). There is evidence to support the fact that products that are made from developed countries, particularly the Western world is of superior value to those produced in developing countries (Bilkey & Nes, 1982; Kaynak & Kara, 2002). A measurement of ethnocentrism among Ghanaian consumers should indicate the extent to which they favour locally-made goods over competing foreign goods. This paper explores consumer ethnocentrism in Ghana by investigating consumers' attitude towards made in Ghana goods.

RESEARCH OBJECTIVES

The main objective of the research was to determine the extent of ethnocentrism of Ghanaian consumers. The specific objectives of the study were to determine the attitude of consumers towards made in Ghana goods; to find out whether consumers would buy made in Ghana goods if there were superior foreign substitutes; to find out the reasons behind preference for made in Ghana goods; to identify why some consumers do not buy made in Ghana goods and to find out whether government campaign and/or education on “buy made in Ghana goods” has had positive impact on the attitude of consumers towards “made in Ghana” goods.

LITERATURE REVIEW

Ethnocentrism refers the idea and belief that products and/or items from one's ethnic environment are superior to others. Marketers therefore distinguish between consumer segments that are likely to be receptive to foreign-made products and those which are not. Highly ethnocentric consumers are likely to feel or think that it is wrong or inappropriate to purchase foreign-made products because of the economic impact on the domestic economy. Non-ethnocentric consumers tend to evaluate foreign-made products more objectively for their extrinsic characteristics (Schiffman & Kanuk 2007).

Ethnocentrism is represented by intense preference for products that are made within the home country. Consumers become ethnocentric as a moral obligation. Ethnocentrism is the tendency for consumers to show a favourable predisposition toward locally made products vis a vis overseas made products (Sharma & Shimp 1987). Ethnocentric consumers believe that it is inappropriate, immoral, unpatriotic and disloyal to a nation to buy foreign-made products in place of domestic-made products. Ethnocentric consumers exhibit a greater preference for locally made products in purchase decisions in which a domestic alternative is available (Watson & Wright 2000). Kapser (1999) indicates that highly ethnocentric consumers are prone to biased judgement by being more inclined to adopt the positive aspects of domestic products and to discount the virtues of foreign made products.

Netemeyer et. al. (1991) made mention of the fact that ethnocentric individuals view their group as superior to others. For this reasons they view their groups from the perspective of their own, and reject those which are different while accepting those which are similar. Purchasing foreign products may be viewed as improper because it cost domestic jobs and is inimical to the domestic economy. The purchase of foreign made products is tantamount to unpatriotic behaviour. Vida and Dmitrovic (2001) are of the view that consumer ethnocentrism gives individuals an understanding of what purchases are acceptable to the in-group, as well as feelings of identity and belonging. For non-ethnocentric consumers or polycentric consumers, products are considered on their own merit exclusive of national origin, or possibly even viewed more positively by reason of the fact that they are not locally made.

According to Maheswaran (1994), the way consumers judge products is influenced by the products' country of origin. In other words, the country of origin of products has a strong influence on ethnocentrism. Consumers' attitude to foreign products may be positive or negative depending on which country it is coming from. Consumers tend to have stereotypical ideas about products and people of other countries and real product evaluation are almost always influenced by country stereotyping (Bilkey & Nes, 1992). Brodowsky (1998) studied consumer ethnocentrism in the USA among car buyers. The study revealed that there was a strong relationship between high ethnocentrism and country-based bias in the evaluation of automobiles. Consumers who are less ethnocentric appeared to evaluate automobiles based more on the merits of the actual automobile rather than the country of origin. Brodowsky (1998), therefore, was of the view that understanding consumer ethnocentrism is very critical to the understanding of country of origin effects.

Other studies have revealed several antecedents of consumer ethnocentrism. Studies by Blabanis et. al. (2001) and Good and Huddleston (1995) have demonstrated that young, male, well educated consumers as well as those with higher income levels tend to be less ethnocentric. Cultural prejudices as well as historical activities of some countries account for negative biases towards products coming from such countries. Schiffman and Kanuk (2007) intimates that some older American consumers have negative bias towards German made products because the role of Germany in World War II is still fresh in their minds.

Colonialism has played no small role as far as ethnocentrism is concerned. In most African countries, where almost all were once colonies of Western Countries, there is still the tendency for consumers to prefer buying products from Western countries. During the colonial days; raw material were sent to the colonial masters from the colonies for the manufacturing of products. These products were sent back to the colonies. This practice hasn't changed much since most African countries and Ghana for that matter are yet to fully industrialise. This, as a result, has created an inordinate preference for Western products and/ or foreign made products. Shimp and Sharma (1987) suggest that opportunities to interact with other cultures, including people and artefacts of other cultures may reduce cultural prejudice and thus the level of preference for locally made products.

Globalisation has become a very popular and important term today in the world of trade and business. One expected that globalisation would bring to an end barriers to world trade. Despite globalisation, barriers to foreign markets remain. One of such barriers is ethnocentrism. Shimp and Sharma (1987), therefore, suggest that with increased nationalism and heavy emphasis on cultural and ethnic identity, consumer ethnocentrism will be a potent force in the global business environment now and the future. At the dawn of the twenty-first century, the world is experiencing a concurrent rise in two major forces: nationalism and globalization (The Economist, 1999) as quoted by (Balabanis et. al., 2001).

International trade activity is becoming a central part of the world economy, and it is recognised that there is a greater necessity to gauge consumers' attitudes toward both domestic and foreign products (Netemeyer et al., 1991). Globalization presents considerable challenges and opportunities for international marketers. The relaxation of trade policies has provided consumers with more foreign product choices than ever before. Consequently, their attitudes toward products originating from foreign countries have been of interest to international business and consumer behaviour researchers for decades (Wang and Chen, 2004)

RESEARCH METHODOLOGY

The study selected the Kwame Nkrumah University of Science and Technology (KNUST) community as the study area. The population consisted of current students of the University. A sample size of 500 was selected. Respondents were randomly selected. The main instrument which was used in collecting data was structured questionnaires. This is because a questionnaire survey is cheaper and less time consuming than in-depth interview (Collis & Hussey 2003). Also considering the number of respondents involved in the survey, it was near impossible to embark on in-depth interviews. The questionnaires were made up of both open and close end questions and were designed in such a way that they were self explanatory. The study was done in the latter part of November, 2009.

In all, Four Hundred and Seventy-Seven (477) questionnaires were returned and all were usable given the response rate of 95.4%. The study mainly employed qualitative methods, but also integrated quantitative methods of data analysis. Thematic analysis was employed to evaluate qualitative data, while descriptive statistics comprising frequencies and simple percentages generated with Statistical Package for the Social Sciences – SPSS and Microsoft Excel were used for the quantitative data.

RESULTS AND DISCUSSION

Attitude Of Consumers Towards Made In Ghana Good

Consumers' attitude towards goods and services is very important to marketers (Schiffman & Kanuk, 2007, Sheth et.al., 1999). Attitude in this context refers to whether consumers consciously or advertently look for the country of origin of goods. High ethnocentric consumers will look for the country of origin and make purchase decision in favour of those products made in their own country (Maheswaran, 1994). On the other hand, less ethnocentric consumers will not bother about the origin of products but purchase decisions are objectively made; more often in favour of foreign products (Sharma & Shimp 1987). Figure 2 indicates that about 44% of respondents look for the country of origin before they buy products and their purchases are made in favour of made in Ghana goods. Their attitude towards made in Ghana goods is, therefore, positive. On the other hand, almost 56% of consumers do not consciously make purchase decision in favour of goods made in Ghana. This category of consumers are, thus, less ethnocentric. This does not augur well for a developing country like Ghana. For an emerging economy like Ghana, it will take high ethnocentric consumers who make conscious buying decisions in favour of goods and services that are made in Ghana before considering those made elsewhere (Vida & Dmitrovic 2001).

Figure 2: Attitude of consumers towards made in Ghana products. Source: Author's fieldwork, November 2009.

Made In Ghana Goods Versus Superior Foreign Substitutes

Related to the above is the issue of whether consumers would buy made in Ghana goods if there were superior foreign substitutes. Figure 2 indicates that 66% of respondents as against 34% were not ready to buy made in Ghana goods if there were superior substitutes. For consumers to be highly ethnocentric there is the need for the goods made in the country to be of good quality (Sheth et. al., 1999). Consumers look for products that will give them the benefits desired (Kotler 2003). Vida and Dmitrovic 2001 are of the view that if consumers believe that foreign products will give them more benefits than those made in their own country, purchase decisions will more often be in favour of foreign goods. The only exception

will be very high ethnocentric consumers who may make decision in favour of made in Ghana goods despite their deficiency in quality (Watson & Wright 2000, Kapser 1999). However, this category of consumers is most of the time not in the majority (Maheswaran, 1994).

Figure 3: Would you buy made in Ghana goods if there were superior foreign substitutes? Source: Author's field work, November 2009.

Reasons For Buying Made In Ghana Goods

The study further delved into the reasons why some consumers buy made in Ghana goods. The various reasons given are indicated in figure 3. Top on the list is patriotism (34%). This corroborates the study of Balabanis et. al. (2001) who found that the determinants of consumer ethnocentrism may vary from country to country and culture to culture. However, in collectivist cultures like that of Ghana, patriotism becomes an important factor. Other important factors worth mentioning are quality (30%) and affordability 17(%). Quality is defined simply as freedom from defect (Kotler 2003). It also described as the ability of the product to satisfy stated or implied needs (Kotler & Keller, 2006). Quality is important to consumer because consumers buy benefits and not just products.

Figure 3: Reasons for buying made in Ghana goods. Source: Author's field work, November 2009.

Reasons For Not Buying Made In Ghana Goods

Just as some consumers have reasons for buying made in Ghana goods; others also have reasons for not buying made in Ghana goods as indicated in figure 4. Top on the list is poor quality. Consumers want to have their monies worth. As stated earlier, consumers buy benefits and not just products. High

ethnocentrism thrives on the production of good quality products that compares favourably with those coming from abroad (Damanpour, 1993; Elliott & Cameron, 1994; Herche, 1992). Affordability is of great importance to consumers (Kotler and Keller 2006, Jobber 2007) in the developing world and Ghana for that matter where income levels are low. It therefore stands to reason that, consumers in Ghana may want to be patriotic by patronising the goods made in the country; however, if prices of foreign goods are lower than those produced in the country, then patriotism will be sacrificed for affordability. Products that appeal to the aesthetic sensibilities of consumers enjoy good patronage (Kotler and Keller 2006). This is very important as 17 per cent of the respondents did not buy made in Ghana goods because of poor packaging. However good a product is in terms of quality, it must appeal to the eyes of consumers to enjoy good patronage (Jobber, 2007; Sheth et. al., 1999).

Figure 4: Reasons for not buying min Ghana goods. Source: Author's field work, November 2009. Government's campaign and the attitude of consumers

Most countries of the world that have developed high ethnocentric consumers did that through effective campaign from the government and sometimes with the help of the industry (Ettenson et. al., 1988; Elliot 1994). Therefore, the campaign of the Ghanaian government on “buy made in Ghana goods” is a step in the right direction. However, there is the need to investigate how this has influenced the attitude of consumers towards made in Ghana goods. The studies of (Elliot & Cameron, 1994; Garland et. al. 1991) indicate that national campaigns are launched with the intention of generating a patriotic bias for buyers to select domestically manufactured goods relative to foreign goods and thus increase the sale of domestic goods. The Study found out that 84% of respondents as against 16% were aware of the Government of Ghana's campaign. Out of this number, 56% said the campaign had positively influenced their attitude towards made in Ghana good. Forty-four percent (44%) on the other hand said the campaign had not influenced their attitude towards made in Ghana goods in any way. The latter percentage is on the higher side given the fact that they are aware of the campaign. There may be some reasons why these respondents are still not changing their attitude towards made in Ghana goods. The issue of quality comes into play. Some still consider foreign goods to be of superior quality (Bilkey & Nes, 1982; Kaynak & Kara, 2002). These are less ethnocentric consumers who make purchase decisions in favours of those goods they think will give them the maximum satisfaction be they from abroad or domestically manufactured (Sciffman & Kanuk 1997).

Another point worth mentioning is the fact that the campaign will have to do more than it has currently done. The study further investigated how respondents become aware or heard about the campaign. The

result is displayed by Figure 6. It came out clearly that television (TV) commercial has been the most influential medium followed by radio, newspapers and others. Consumers prefer TV commercials because of its power of audio visuals. The reason for the likeability of TV commercial is the fact that it is active (Blythe, 2008). Its audio-visual nature and wider reach also account for the likeability of TV commercials (David & Lomax, 2008). When consumers watch television, they tend to be “captive” audience absorbing whatever is shown (David & Lomax, 2008).

Figure 5: How respondents heard about the government’s campaign. Source: Author’s field work, November 2009.

CONCLUSION AND RECOMMENDATION

On the basis of the results and discussion, it can be concluded that Ghanaian consumers are not highly ethnocentric. This is explained by the fact that their attitudes towards made in Ghana goods is not up to the level that will help boost local production. Countries need their citizens, particularly countries of the developing world, to be highly ethnocentric in their attitude to local goods. This can be achieved through the encouragement of the local industries to improve the quality of their products to compete favourably with those from other parts of the world.

It is, therefore, recommended that the industries in the country be encouraged to increase the quality levels of their goods to compete favourably with those from abroad. The industries should also find ways of reducing their cost of production in order to reduce the prices of their products which more often are higher than those coming from abroad. Production levels should also increase especially food and electronic goods to reduce the reliance of customers on imported food and electronics. The government of Ghana should revamp its campaign of “buy made in Ghana goods” and the industries must join hands

with the government in this direction. There should be effective use of TV and radio to educate and sensitize the citizenry on the need to patronise made in Ghana goods since it has a direct link to the economic development of the country and this should be sustainable.

GREY MARKETING AS INDICATION OF PRICE STRATEGY DEFICIENCY: BASED ON THE REAL LIFE CASE FROM CANADIAN KNITTING CRAFT INDUSTRY

Igor Pustylnick, SMC University, Zug, Switzerland

INTRODUCTION

The term grey marketing refers to the process of selling the legitimate trademarked goods through the non- authorized channels. According to (Picard, 1996) “Gray marketing occurs when one party possesses the exclusive right to sell a certain product designated by a trademark in a certain area, and another party sells similar products in the same area under the same trade name.” This definition requires the presence of two very

Important conditions:

- The existence of the agreement of exclusive rights to sell a certain product in the mentioned territory.
- The existence of a strong registered trademark, which is recognized on a certain territory where a potential grey marketing activity may occur.

Despite the relative ease, with which any grey marketing scheme may be sprung to life, the appearance of grey marketing is not very frequent. For the grey marketing to exist

- The product must be superior to the others in the category, like Porsche cars or Rolex watches.
- The product must be perceived as significantly overpriced by the relatively large group of consumers. Grey marketing usually appears as a result of the combination of the aforementioned conditions.

In many cases grey market goods appear in the retailer's hands through the maze of semi-legal operations, which can generate a legitimate interest from the authorities. The progress of the international trade and the increase in the number of the multinational and global organizations around the world have spurred the creation of the enormous number of distribution channels and subsequently the equally large number of entities, whose sole

purpose in the trade cycle is to act as an intermediary between the source, which is not necessarily a manufacturer, and the destination, which is not always a retailer or a consumer. These organizations have formed a rather impenetrable supply chain each element of which represents a non-productive entity generating its own profit by using the difference between the input and output prices. Passing through this chain the price of the goods can increase three or even fourfold without any measurable changes in a product itself. It became possible for the small entrepreneurial companies

- To purchase the goods legitimately in one part of the world,
- To move them to the other part of the world,
- To sell them at the markup generally acceptable in the destination country

- To be able to set up the price well below the one set through the legitimate distribution chain for the same product.

The combination of the four aforementioned conditions forms a viable opportunity for the creation of a grey market for any product.

Grey marketing is the process, which is regulated solely by the country of import. Each country has its own process of settling grey marketing cases. In the USA the definition and the clauses of grey marketing are regulated by the Lanham Act, which accordingly to (Curley and Ferry, 2006) gives the trademark owner full rights to decide who will sell the goods on the territory of the US.

However, with the advent of the Internet and e-commerce any definition of sale became even more blurred. The retailer of goods may reside in one part of the world and the buyer can potentially reside anywhere else. The Internet sale transaction may be executed in the country where Lanham Act or similar legal norms are not applied. The delivery of the product to the customer appears from the legal standpoint as a sending of a simple

Fully legal mail parcel from one country to another. In the case of the grey marketing the importer of goods does not break any import laws of the country they reside in. The surface legality of the grey marketing cases allows them to persist over the large period of time since it takes time for the manufacturer to detect the illegal sales (Mendelsohn & Stanton, 2010).

(Chen, 2002) argues that persecuting grey marketing efforts of importation and selling the goods yields the unfair advantage to the legal distributors of the goods thus creating a monopoly for selling the products, which overall hurts the consumer. The entrepreneurs see grey marketing as the opportunity to sell the goods at lower price on the basis of incurring lower costs during the acquisition and the importation process. Gray marketing is by large a response by the market to the creation of a rigid distribution structure by the manufacturer of the goods or the owner of the trademark. (Clarke & Owens, 2000)

As it was stated earlier grey marketing is only possible if the product is of excellent quality, it is sought by the consumers and is perceived as overpriced. Gray marketers would endeavor to import and sell the product in the target country only if the cost of delivery of the product to the market would be significantly lower. Hence the gray marketer will still make a profit by selling the product at a lower price (Mathur, 1995).

The main cause of appearance of a gray market for a product is the division of the responsibilities inside the product distribution chain. When the product first appeared and sold locally the manufacturer of the product undertook marketing and distribution efforts in order to deliver the product to the retailers. As the enterprise of making the product grows the manufacturer attempts to segregate themselves from the distribution process and concentrate all efforts on R&D and manufacturing. At this stage of product development the manufacturer seeks the alliances with the companies which would take over the distribution of the product in the certain territory. (Lee, 2006)

According to (Huang et al, 2008) the distribution company does not strive to improve the product and/or fit it to the needs of the consumer. It simply owns the trademark on the territory of the distribution, which gives it exclusive rights to deliver the products to the retailers. In some cases the manufacturer retains the right to influence the price policies. However in the vast majority of instances the distributor has exclusive rights to set the price of the product on the territory it operates.

When the market is perfectly competitive the distribution company has no other choice but to compete on the price with the distributors of the similar products. In this case the distribution operates by installing a market acceptable markup over the overall cost of the product. When the market is monopolistically competitive, distributors may apply a higher markup to a high quality product which in the perception of the consumer has no analogs on the market (Argenton, 2010). Monopolistically competitive market usually creates perfect conditions for overpricing the product. If the product is mass produced and sold in many places around the world, this approach to pricing can create conditions for the appearance of grey market for the mentioned product.

(Frenzen & Nakamoto, 1993) underscore the importance of the information flows in any market. Consumers make purchasing decisions based on the options presented to them by the operators of the certain market. (Gal- Or, 1988) states that incomplete information may seriously hurt the ability of the market player to make a right decision. (Livnat, 1986) shows that market equilibrium can shift base on the appearance of the information new to the group of buyers and sellers. Grey markets appear in part because consumers lack the information on the proper value of the illegally sold product and on the availability of substitutes of the equal quality.

(Felten, 2010) notes that appearance of grey marketing shows the possibility of price arbitrage, which is very similar to the one observed in the currency trading. However, it can be argued that in the market of the tangible goods the ability to extract the gains from the alternative routes of delivery of the product is much smaller than in the foreign currency trades. This statement can be supported by the following underlying conditions.

- First of all during the process of manufacturing and distribution of the product the market conditions may change sufficiently so that initially considered arbitrage may no longer exist.
- The delivery of the product to the consumer market is subject to the transportation costs and applicable tariffs. Performing the delivery of goods via alternative channel, and especially the fact that the goods are delivered in small quantities, can negate the possibility of the arbitrage completely

OBSERVED CASE OF GREY MARKETING

Market Analysis

The market of knitting needles has always been a two tier market. The first tier contains needles of premium quality, which are coveted by consumers. These needles are made out of chrome plated aluminum tubes, high quality bamboo, wood such as birch or beech, bones and dairy byproducts. The price of these needles rarely reflects the costs of manufacturing and is set based on the estimation of what would be the price consumers are willing to pay. The customers buying these products are aware of their superior qualities.

The second tier of the market is comprised of the low quality bamboo needles as well as needles made of inexpensive steel and plastic. These needles are often made in the countries with less expensive labor and sold all over the world under different brand names. The inexperienced knitters buy these products mainly because they are not sure if they would want to practice the craft or move on to other endeavors.

Knitters must make a significant investment into the good quality premium tier needles in order to satisfy their needs. It is customary for an average knitter to have 8-10 sets of needles of different diameters. The professional knitters usually have multiple sets of needles of the same diameter, which they use on the same knitting project or multiple knitting projects simultaneously.

Case Description

Many cases of grey marketing are reported when the process of illegal import and sales of goods is detected by the owner of the trademark, who discovered the violation of their rights. Because of this many cases lack both continuity and dynamics when reported in the mass media and examined in the scholarly papers. The case described in this paper was a staged experiment which was observed from the minute of its inception to the time when the grey marketing efforts were shut down.

The case under review is the real world example of grey marketing which happened in Canada in 2004-2009. Headwater Wool is a small importer and retailer of yarns with headquarters in Orangeville, ON. The owners of the company favor Russian Style of knitting, which among many other qualities requires needles, which have very smooth surface. One of the owners acquired this habit while using Russian manufactured steel needles with Chrome-plated surface. After a serious consideration the Russian needles were deemed not suitable for import because Russians do not produce needles thicker than 5mm.

Taking into consideration the requirements of the Canadian knitting market, which has a demand for the needles of 2mm-12.5mm and sometimes even thicker, the company decided on using similar chrome plated needles produced in Germany, called Addi Needles. The needles were manufactured in Germany and distributed in Europe by the manufacturer GUSTAV SELTER GMBH & CO. KG. However in North America the same needles were distributed by the company called Skacel, which has an exclusive right granted by SELTER to sell these needles anywhere in North America including all of the territory of Canada.

Skacel has a distribution partner in Canada, which is called Wool and Wicker and which has a right to represent itself as Skacel Canada. The information on what is the real cost of Addi Needles for Skacel is private and confidential. This paper will use the estimated price based on certain assumptions to illustrate the given case. The following table represents the transformation of price as the needles are passed through the distribution channels. It is assumed that Wool and Wicker used Canada Post services to deliver the needles. If they use a courier the retail price might reflect it.

Table 1: Progression of Price Increases for Addi Needles

Skacel Wholesale Price	W&W Wholesale Price	Transportation Costs	M
\$8.00	\$12.00	\$2.00 (per pair)	\$24.00-26.00

Table 1 shows the progression of price increases for Addi needles as they move along the supply chain.

The price of the products consists of the cost of manufacturing, delivery to the consumers and the acceptable profit margin. The manufacturer can use a marginal cost model as they are in control of the manufacturing process. Distributors are more used to the cost-plus or full-cost models, which give them control over the fluctuation of currency rates and the fluctuation in manufacturer costs. It is also quite common in North America, to use the “double cost MSRP”, which suggests that MSRP (or DSRP in the case of a distributor being a price setter) should be set as double of wholesale price of the product. It is assumed that this formula would cover all costs incurred by the buyer as well as the collateral costs of advertisement and stale stock. This pricing scheme also takes into consideration that no more than a half of all products would be sold at the suggested price and that the retailer would be conducting dump sales of the stale stock using significantly lower prices.

Figure 1: Sales of Needles by Brand and Type

Addi clearly dominated the premium market segment because of the versatility of the product and its superior quality. Besides the excellent quality chrome plating its circular variety also had a very flexible non cringing cord, which was extremely useful in knitting socks using “Magic Loop” technique.

Market Dynamics

The product sold as a grey market product usually causes changes in the structure of the market. The consequences of the grey market differ based on the extent at which the grey market retailer has access to the consumers of the product. In order to keep low profile as well as to keep prices as low as possible grey market retailer does not advertise the product on the same scale as the original manufacturer and/or distributor. The most common marketing approach for the grey market goods is a viral marketing. Knitting is a social hobby and many knitters assemble into guilds or collective in order to spend few evenings a month indulging in their hobby. These groups usually discuss the prices of the products and pass around the information about the bargains and below market prices for yarns and needles. At the same time grey market retailer has to assume full responsibility over the faulty products thus considering the costs of replacement and/or fixing of the faulty products into their price model.

The market for the premium product exists as long as the product remains relatively expensive and relatively unreachable by price to the large number of consumers. Gray market for the same product may decrease the longevity of the original market. In this case grey market retailers would not be able to sustain the level of sales they enjoyed originally thus decreasing the viability of the grey market for a product. In the case of the knitting needles market there are two trends, which play role in the original appearance of the grey market:

- The buyers and the potential buyers of the premium product see the opportunity to buy a premium product for lower price
- The buyers of the second tier products can be convinced that the difference in price is much lower and that the premium quality product yields other tangible benefits to the user such as less strain to the hands, higher speed of knitting and so on.

As a result the initial acceptance of the grey market pricing scheme was very high and the Headwater Wool reaped tangible benefits causing the legitimate distributor a significant loss in revenue. In time the grey market retailer saturates the segment of the market, which is the most susceptible to bargains and the amount of sales naturally drops. Hence this market appeared relatively short lived. Figure 2

illustrates this trend by using the sales of Addi Needles by Headwater Wool.

Figure 2: Distribution of Addi sales by Headwater Wool in 2004-2009

As Figure 2 shows the peak of sales is reached very soon after the company made a decision to import the goods by using the alternative channel. Despite relying only on the viral marketing Headwater Wool reached the peak of sales in the 2nd year. During the third year of grey market operation the company's efforts were detected by the distributor (Skacel) and the manufacturer (Selter) who made every attempt to stop the grey market sales. These efforts together with the relative market saturation have caused the drops in sales with subsequent decision to exit the market by Headwater Wool. This case clearly shows that grey markets even if they are not targeted legally with "cease and desist" orders are not sustainable on the long run because they target only those consumers who are willing to find the lower priced goods and who are not interested in the potentially illegal character of sales.

DISCUSSION

Implications for the Grey Market Retailer

A small entrepreneurial company would consider involvement in the grey market based on the perceived possibility of the price arbitrage. For the arbitrage to exist there should be a glaring discrepancy between the costs of the products in different parts of the world. This inconsistency in costs must offset the costs of delivery, the costs of sales and the costs of upholding the warranty and replacements by a grey marketer in order to create a consideration for the price arbitrage. Besides, the grey marketer also must take into consideration the low lifespan of the grey market due to the conditions described earlier and the possibility of both injunctions and barriers created by the owners of the legal distribution channels.

While considering the possibility of arbitrage the potential grey marketers must also consider that involvement in the grey market of any substantive size would require a large initial investment especially if arbitrage is based on a large projected volume. Regular distribution in North America uses Net 30 price model for the distribution of goods to retailers. By using this model any retailer has 30 days of sales of the "free" merchandise before they are absolutely required to make a payment to the distributors. The relationship between the paying distributor and the manufacturer is even more relaxed and Net 60 or Net 90 models are often used.

Grey market distribution requires the company to buy the goods outright by paying the full price at the time of purchase. One of the reasons for this to happen lies in the fact that the grey market retailer and the catering distributor want to stay under the radar and reduce the interactions to the absolute minimum in order to maintain business relationship for a longer period of time. From the other hand the channels of goods acquisitions for the grey market are often located in the parts of the world, which do not accept

any form of payment other than Cash on Purchase. The company considering grey market retail must include the cost of capital invested in the purchase of goods in order to create a full arbitrage picture.

Consequences Of Gray Marketing For Manufacturers

For the consistency of the material presented in this paper it is considered that the manufacturer of the goods is the owner of the original trademark. Although a distribution company can own a trademark on the certain territory, the overall ownership of the trademark belongs to the manufacturers. In the case of Addi Needles it would be SELTER. It is quite often the case that independent distributors of the product attempt to secure the distribution rights for a long period of time. This policy is based on the consideration that introduction of the product to the market of a significant size such as North America may take a significant time and will be met with the sizable resistance by the consumer community.

This existing order of things locks a manufacturer out of the price setting process. The distributor becomes the only influential price setter on a certain territory. The agreements set up between the manufacturer and the distributor often dictates only the volume of product which distributor must purchase or order from manufacturer in order to continue the relationship. Quite often the distributor decides to set the price artificially high in order to maintain the status of the product as a premium purchase. For the seasonal product such as knitting needles⁸ the distributor attempts to offset the poor performance over the periods with the lack of sales.

Deficiencies in Price Strategy: The wide spreading of the e-commerce created significantly more transparency in any market of the consumer goods including the market of the knitting needles. The manufacturing company attempts to use the same price scheme for all of its distributors in order to avoid the conflicts, which can potentially result in a legal action especially in the USA where unjustified price discrepancy is explicitly forbidden based on the Robinson -

Patman act (Beard et al, 2009). In this case it is the responsibility of the distributors of the product to set the prices in a manner excluding the possibility of an arbitrage at the territory of their distribution. In the described case of Addi Needles there were several attempts other than the one by Headwater Wool to sell the needles in North America via Internet by the prices, which are significantly lower than the price set by Skacel. The most notable example of this is the British company Angel Yarns which has been effectively shut down from selling Addi Needles by the manufacturer.

Hence the manufacturer of the products has only two viable options, such as setting a proper price which would deny the possibility of the arbitrage or fighting the sales of its products by the lower prices via injunctions. The deficiency in price strategy can be attributed to the excessive independence given to the distributor over setting the price at a certain distribution territory. It can also be attributed to the improper positioning of the product. Considering a product as a luxurious and premium would attract grey marketers much faster than in the case when the product is priced to sell. Hence in the case of positioning the product as a luxury one the manufacturer of the product must have much stronger control over the distribution of the products (ex. luxury cars).

Appearance Of Substitutes: (Lin & Lin, 2010) state that appearance of substitutes in the monopolistically competitive markets has high probability. The feature differentiated leading brand of products is always a target of copy by white labels and competition. In the case of grey market products we shall consider as substitutes the products, which have similar features, comparable quality and the price which rivals the price set by the grey market retailers. There is no visible connection between the appearance of the grey market for a certain brand and the appearance of the substitutes. However in some cases the price setting strategy of grey market retailers can spur the creations of equally priced substitutes of comparable quality. Unlike the grey market goods, the substitutes are completely legal. The manufacturer of the product can

change its features in order to differentiate from the substitutes or reduce the price in order to make substitutes not so viable.

Since Headwater Wool entry into the grey market of Addi Needles several substitutes of comparable price and quality have appeared on the knitting needle market. All these needles are made out of chrome plated aluminum tubes. They all sport flexible non-tangling cords, which make them as versatile as Addi. The first entrance was made by the company called Knit Picks. The original price of the needles was \$10-15 but it dropped further as of now. Since 2008 two companies: HiyaHiya from China and Prym from Germany entered North American Market. The prices of the needles vary from \$10 to \$15. In 2010 despite being considered the best in the industry Addi needles are being priced out of the competition.

Table 2: Distribution of Prices for the Premium Segment Chrome-Plated needles

Knit Picks	Hiya Hiya	Prym	Addi
\$7.00	\$11.00	\$7.00	\$15.00

Table 2 shows the distribution of prices for the premium segment Chrome-plated needles at the end of the period 2004-2009 when grey marketing case was perpetuated.

The prices given in the above table are the retail prices of the needles. Out of three competitors Knit Picks does not wholesale the needles. Because of its size the company manufactures its own needles and has an obvious advantage on the internet market. On the retail market both Prym and Hiya Hiya have lower prices than Addi. The quality of the needles become virtually comparable and the customers are switching to the more affordable product.

Conclusion: Manufacturer of the premium product must always consider that the product would be out-priced or even outright replaced by the substitutes. The manufacturer cannot control the quality of the substitutes as compared to their own products. Gray market sets the new acceptable price for the products. Elimination or reduction of the grey market can give a manufacturer a temporary relief from the onslaught of the grey market retailers. However the price set by the grey market is the price that will be targeted by the manufacturers of the substitutes entering the market. By the time the substitute products enter the market the manufacturer of the original product being targeted must be ready to come out with the product containing the new features enough to differentiate the product while keeping the price at the same level.

Consequences Of Grey Marketing For Distribution Channels

This paper does not consider distribution channels which are fully dependent on the manufacturer for its price setting policies. However it is important to discuss in the scope of this paper the channels which have a large degree of autonomy over the setting of the price on their territory.

Potential For Fighting Grey Marketing: Gray market retailers use absolutely legal channels in order to deliver goods to the consumer. They pay the applicable tariffs and duties and charge all applicable taxes as well. In many countries these activities are considered legally entrepreneurial. The laws of the USA allow the owner of the trademark to get a court injunction related to the sales goods, considered to be part of a grey marketing scheme. However the onus lies on the owner of the trademark on the certain territory to prove that the trademark infringement indeed occurred. In the case of Addi Needles the North American distributor Skacel marketed the needles under the different trademark “Addi Turbo” in the attempt to underscore the potential for faster knitting with those needles. Skacel used a different color scheme for the packaging in the attempt to distance itself from the manufacturer thus concealing its

identity. In the attempt to fight grey market sales Skacel had to change the packaging to resemble the original one used in Europe. They also had to display the original trademark to make sure that the infringement can be easily traceable. It is the goal of the grey marketer to piggyback on the name and the reputation of the product sold on the grey market. Hence the distributor owning the trademark has to abandon the attempt to re-brand the product and stay as close as possible to the original product trademark to be successful in fighting the grey marketing efforts.

Use Grey Market For Adjusting Pricing Policies: Grey market is a clear indication of the deficiency in the price policy set by a manufacturer or a distributor of a product. There is no single set of rules which would apply to all products anywhere in the world. However, if, as in the case of Addi Needles, the price of the product sold by the distributor is almost double in value in comparison with the grey market price, this may serve as an early indication that the price of the product is not justified by the market conditions.

The owner of the price strategy must realize that the customers, spoiled by the grey market prices will not be willing to return back to the original pricing even if the grey market retailer has been ordered to stop the sales. Another reason for price adjustment is the potential saturation of the market at a lower price through the grey market sales. If the distributor is not willing to adjust the price they may face the reduced demand for the product by the time they finished fighting the grey market retailer in court. It would be much more efficient to attempt to fight the grey market using the market mechanisms of price adjustment.

As stated earlier any grey market retailer must make a substantial upfront investment into the potential grey market goods. They must see a clear potential for an arbitrage which would allow them to return the initial investment and to make the gains based on the price arbitrage. Reducing the price of the product sold over the legal channels may stop the grey marketing scheme at its inception and protect the legal distributor of the goods.

Use Grey Market For Adjusting Distribution Chain: In many cases distributor attempts to secure the largest possible territory for their distribution efforts in order to achieve maximum gains from their endeavor. Sometimes the distribution mechanisms are not properly aligned with the transportation mechanisms available in the territory of distribution. This causes larger transportation costs which are inevitably used in forming the retail price. The appearance of the grey market would indicate that the overall retail price is too high and that the transportation factor may be the one to blame for the price escalation.

In the case of Addi Needles both Skacel and Wool & Wicker are located at the Pacific Coast in Seattle and British Columbia respectively. While both companies enjoy the ease of communication with each other in the same time zone, the price of transportation through the territory of Canada, especially to the large Eastern markets of Ontario, Quebec and to the lesser extent the Maritime Provinces, is extremely high. In the view of the possibility of fighting the grey marketing in the East it would be much more prudent for Skacel to set up a distribution centre in the Eastern Canada, which would cater to the aforementioned regions. The reduced price of retail of the original product would have offset the damage done in the East by the grey marketing efforts of Headwater Wool.

CONCLUSION

It is very important to underscore that although grey marketing has damaging effect for the company price strategy and especially the bottom line, it can also be used for the company's advantage. Long and well established business sometimes becomes oblivious of the changes appearing on the market of a certain product. Gray Marketing may serve as an indicator of the deficiency in price strategy (Thompson, 2009). It can also pinpoint at which part of the distribution chain the costs may be too high or the operations

become intolerably inefficient (Lim, 2001). It is important for the manufacturer of the goods to have a good feel of how their distribution chain performs. Even without tracing the full chain of delivery of goods which will form a grey market the manufacturer can detect and potentially correct the pricing strategy of the original product. This correction would eliminate or reduce the threat of grey marketing. The price setting schemes set by the grey marketing are not only dangerous to the bottom line of the manufacturer of the original product. By using the reduced prices for the original product the grey market retailer prompts the consumers which prices they are to expect for the products of a certain quality. The makers of the substitutes use the price set by the grey marketing as a benchmark for the entry prices of their products. As a result the manufacturer of the original product has a bigger threat from the new entries to the market in addition to the one they would have from the grey marketing.

Any market is based on the market laws set by microeconomics. Gray marketing is a manifestation of these laws showing that the price setting strategies of a product have to be corrected. This outcome of the study is consistent with the findings of (Lee, 2006) and (Thompson, 2009). The owner of the price strategy must treat grey marketing not as an illegal menace but as an indicator of existing faults in their own price strategy.

STUDENT LEARNING IN ONLINE ACCOUNTING PROGRAMS

Donald A. Schwartz, National University

ABSTRACT

Is student learning in an online accounting program equal to the learning that occurs in a traditional on-campus classroom? This question is becoming increasingly relevant as a growing number of students opt for the flexibility of taking courses online. Most studies in this area have compared a single experimental online section with a face-to-face section of the same course. Though such studies can control for effectiveness of the instructor, they are limited in scope. In contrast, this study uses data from 61 face-to-face sections and 70 online sections of the twelve accounting courses that comprise the university's undergraduate accounting program. Four metrics were used, the primary one being student achievement on standardized assessment tests. The results showed a lower level of achievement in the online sections. However, differences were relatively small, and an analysis of the four metrics provided clues to opportunities for making student learning in online accounting programs no less effective than in a traditional classroom environment.

INTRODUCTION

National University is a private not-for-profit university founded in 1971 in San Diego, California. It has grown to be the second largest private not-for-profit university in the state. In recent years, growth is attributed almost entirely to enrollment in online programs. The university's primary mission is to provide adult learners with affordable access to high quality undergraduate and graduate degree programs. The average age of the students is 32. Most are fulltime students (12 semester hours) taking classes at night or online while working at fulltime jobs during the day. Though standardized test scores such as SAT and GMAT are not used to screen for admission, students must maintain minimum GPAs of 2.0 for undergraduate and 3.0 for graduate courses. Of its 22,000 students, about 40% are in the San Diego County metropolitan area, and most of the remaining 60% are spread among more than a dozen campus locations throughout Northern and Southern California and Las Vegas Nevada. A small percentage are out-of-state students taking courses online. Contact time in on-site classes ranges between 40 and 45 hours per course. Approximately 85% of the courses are taught by part-time faculty most of whom are currently working in their profession. The part-time faculty are hired, mentored, and evaluated by fulltime faculty who teach the other 15% of the courses.

In 1998, the university's College of Letters and Sciences and the School of Business and Management began to develop online versions of some of their programs, using Blackboard and later eCollege platforms. The business school's B.S. in Accountancy was one of the first. Unlike the university's other schools, the dean and faculty of the business school decided to include live chat sessions to supplement asynchronous threaded discussions. Until 2004, the chat sessions were limited to text messaging. In 2004, a VoIP-based system was adopted to enable voice interaction (students and the instructor use headsets with microphones) along with visual presentations using whiteboards, Powerpoint, spreadsheets, and the like. There are no significant demographic differences between students in online classes and their counterparts in onsite courses (the term "onsite" is used rather than "on-campus"). While some students take some of their courses online and others onsite, most students take all of their courses in the same delivery mode.

Now, more than a decade after the start of online programs, all of the business school's programs are offered online as well as onsite, and almost two-thirds of currently enrolled students are taking the online

version of their course. The business school's policy is to include a minimum of 90 minutes of live chat sessions each week. Instructors of accounting courses are encouraged to offer two such sessions per week, and in many cases the sessions exceed two hours in length as students continue to pose questions or become engaged in discussion. To accommodate students who, because of work-related or personal commitments or because of time-zone differences, are unable to participate in the live discussions, the sessions are recorded and students are able to play the recording at their convenience. The recording also makes it possible for students to review portions of the lecture or discussion that they missed or were unclear at the time.

Though instructors have the freedom to use individualized teaching strategies, assignments, exams, and grading factors, all instructors of a given course are required to use a standardized syllabus, which includes a standard set of learning outcomes and specified textbook. The same learning outcomes and textbook are used in both online and onsite classes of a given course.

THE LITERATURE

According to studies by the Sloan Consortium (Sloan-C) of institutions committed to high quality online education, nearly one in four students take at least some courses online, up from one in ten in 2002. Two million students, most older than the traditional 18-22 year-old undergraduates, take all their courses online, and two million more take one or more online (Sloan-C, 2009).

In 2009, a report entitled *Evaluation of Evidence-Based Practices in Online Learning: A Meta-Analysis and Review of Online Learning Studies* was prepared for the U.S. Department of Education (U.S. Department of Education, 2009). Four research questions were addressed:

1. How does the effectiveness of online learning compare with that of face-to-face instruction?
2. Does supplementing face-to-face instruction with online instruction enhance learning?
3. What practices are associated with more effective online learning?
4. What conditions influence the effectiveness of online learning?

The goal of the study was to provide policy-makers, administrators and educators with research-based guidance about how to implement online learning for K-12 education and teacher preparation. However, of the 1,132 relevant articles found, there was sufficient data from only 46 studies to include 51 estimated *effect sizes* in the analysis. (*Effect size* is defined as the difference between the mean for the *treatment* or online group and the mean for the face-to-face or *control* group, divided by the pooled standard deviation). Of the 51 estimated effect sizes, only seven involved K-12 learners. The types of learners in the remaining studies were about evenly split between college or community college students and graduate students or adults receiving professional training. The most common subjects among the latter were related to health care. Among the findings:

On average, students who took all or part of their class online performed better than those who took the same course through traditional face-to-face instruction. However, the authors point out that a number of factors other than the delivery mode might have contributed to this result.

- Instruction combining online and face-to-face (blended) had a larger advantage relative to purely face-to-face instruction than did purely online instruction.
- Other than the amount of time spent by online learners, the variations in the way in which different studies implemented online learning did not affect student learning outcomes significantly.

- The effectiveness of online learning approaches appears quite broad across different content and learner types. The tests for learner type and for subject matter as moderator variables were non-significant.

The study estimated the effect sizes for 51 face-to-face vs. online comparisons, of which 28 compared face-to-face with purely online conditions, and 23 compared face-to-face with a blend of face-to-face and online activity. For the purpose of this paper, only studies from the purely online group were considered. Studies that found purely online courses more effective than face-to-face were represented by positive effect sizes; those that found face-to-face courses more effective were represented by negative effect sizes. Though effect sizes ranged from a negative .796 to a positive .800, 22 of the 28 studies had positive effect sizes and the overall mean was a positive .1424 of the 28 studies involved fewer than 50 participants in each group.

With an effect size of .800, the Schoenfeld-Tacher study involving a histology course at a 4-year university was the most positive in favor of online over face-to-face. Eleven students enrolled in the online section of the course, and thirty-three in the onsite section. The results of a posttest were significantly different, with students in the online section outperforming their counterparts by an average of 7 percentage points. The online section also had a greater proportion of higher (per Bloom's Taxonomy) level of interactions (Schoenfeld-Tacher, 2001).

The Summers (2005) study compared the achievement of 17 nursing students who elected to take the online section of a statistics course with 21 students who chose the face-to-face section. Achievement was measured by course grades. The same instructor taught both sections and the courses were equivalent in content and examinations. Interaction in the online section was in the form of asynchronous threaded discussions; there were no live chat sessions. The study found no significant difference in grades among the two groups and concluded that it is possible to teach a science course entirely online without any adverse effects on academic outcomes. However, students in the online course were "significantly less satisfied with the course than the traditional classroom students on several dimensions".

In the 2008 Beeckman study (effect size 0.187), 426 nursing students were randomly assigned to either a face-to-face or an e-learning program containing the same learning content. The nursing students achieved better results when using the e-learning program. It was concluded that while both methods are adequate to acquire the knowledge about the differences between moisture lesions and pressure ulcers, e-learning allows for repetition of the training which the authors considered necessary for this type of training (Beeckman, 2008).

In 2005 and 2006, Benjamin et.al. conducted a study (effect size 0.046) to determine if web-based training is as effective as in-person training on improving basic nutrition and physical activity knowledge for promoting healthy weight in preschool children. The measure was performance on a 28-item multiple choice test. The authors found no significant differences in post-training knowledge between in-person and web training. Scores on the post-training knowledge test were within 0.5 points for the in-person and web trained groups, demonstrating that web-based instruction is as effective as in-person training (Benjamin, 2008).

The objective of a Campbell study was to assess whether participation in *face-to-face* discussion seminars or *online* asynchronous discussion groups had different effects on educational attainment in a web-based postgraduate research methods course. Results: Students choosing *online* discussions had a higher Core Methods assignment mark (mean 60.8/100) than students choosing *face-to-face* discussions (54.4); the difference was statistically significant ($t=3.13$, $df=102$, $p=0.002$), although the authors acknowledged that these results ignore confounding variables. The authors concluded that a research methods course can be

delivered to postgraduate healthcare students at least as successfully by an entirely *online* as by a blended method in which students accessing web-based teaching material attend *face-to-face* seminar discussions (Campbell, 2008).

Zhang hypothesized that given the same amount of learning time, students in an interactive multimedia-based learning environment can achieve higher test scores than those in a traditional classroom. His study involved two controlled experiments, one on the subject of relational algebra, and the other on internet search engines. Individual learning performance was measured by the margin between posttest scores and pretest scores. In the first experiment, approximately 17 sophomore and junior students were randomly assigned to each of the e-learning and traditional groups. The second experiment had approximately 35 students in each group. The results of the two experiments showed that students in a “fully interactive” e-learning group as well as those in a “less interactive” group achieved significantly better performance and reported higher levels of satisfaction than those in the traditional classroom (Zhang, 2005).

The Cavus study (.466 effect size) was one of the few meta-analysis studies that tested for the effect of an online course enhanced by a synchronous collaborative tool. It involved 58 students studying the programming language Java. Approximately one-third of the group was assigned to each one of three learning environments: a traditional face-to-face class, an online class with a standard collaborative learning tool, and an online class with an advanced collaborative tool. The results based on two different assessment measures indicated that students using a standard collaborative tool in conjunction with a web-based learning system had approximately similar success rates as those using the traditional methods of learning, and a higher success rate when an advanced collaborative tool was used (Cavus, 2007).

Not among the studies included in the meta-analysis, the Aragon study of 2002. Researchers assessed students enrolled in an online instructional design course and students in an equivalent face-to-face course to determine the students’ preferences across the constructs of motivation maintenance, task engagement, and cognitive controls. While significant differences were found between the learning style preferences of the online students and those of the face-to-face students, these differences were not significant when success factors were controlled. The results of this study suggest that students can learn equally well in either delivery format, regardless of learning style, provided the course is developed around adult learning theory and sound instructional design guidelines (Aragon 2002).

Though shown with a negative effect size of -0.106, the findings of the Schmeeckle 2003 study suggest a neutral position with respect to the comparative effectiveness of online vs. classroom training. The purpose of the study was to evaluate both the *effectiveness* and the *efficiencies* of online training as compared to classroom training of Nebraska Jail Management trainees. Trainees were randomly assigned to receive either online or classroom training. Learning, motivation, and attitudes were measured for instructional *effectiveness* while instructional time and cost/benefit calculations were used as measures of *efficiencies*. Results indicated that online training is *as effective* an instructional method as classroom training, and *more efficient* than classroom training. No meaningful learning differences occurred between the two groups, but online training was completed in almost half the time of classroom instruction and at a lesser cost. However, the classroom group reported higher motivation and positive feelings concerning their instruction than did the online group. A second study experimentally examined learning, instructional time, motivation, and attitude advantages of multimedia included in the Jail Management online training courses. Although hypothesized that video would enhance learning, motivation, and attitude, there were no differences in UNL student participants’ test scores or surveys scores whether they received training with text only, audio with the text, or video with the text. Only instructional time differed among the groups (Schmeeckle, 2003).

Among the six studies with negative effect sizes was the Mentzer, Cryan, Teclehaimanot study with an effect size of negative .281, in which a face-to-face section of an Early Childhood Education course with 18 traditional “right out of high school” students was compared with an equivalent number in an online section of the same course. The latter were randomly selected from a group of 36 students who had agreed to be assigned to either section. Both sections were taught in the same semester by the same instructor who used the same assignments and exams in both. The online section included two 1-hour live chat sessions per week. (The article did not indicate whether the chat sessions were text-based or allowed for voice/visual interaction.) Indicators of student success included (a) midterm examination, (b) final examination, and (c) overall points earned for the semester including points earned on assignments. Of the three, only the mean score for the overall course grade differed at a statistically significant level. Students in the face-to-face section averaged an A-, whereas those in the online section averaged a B. However, the author states that “a closer look at student records for the two sections revealed that students in the web-based course did not earn lower grades on the assignments but merely failed to submit some of them, suggesting that learning outcomes were similar but that the personal contact of a face-to-face course positively influenced and motivated students to turn in assignments.” (Mentzer, 2007)

THEORETICAL FRAMEWORK

The objective of this study was essentially the same as that of the studies contained in the meta-analysis: that is, to compare student learning in an online environment with learning in a traditional classroom environment. However, the meta-analysis studies were experimental in the sense that an online class was set up for the express purpose of comparing the achievement of its students with that of students taking the same course in a face-to-face classroom environment. Since the studies were pre-planned, controls could be employed, such as random selection of students for the onsite and online sections to ensure common demographics. But being a prearranged experiment, there is at least some chance that the researcher, albeit unconsciously, set the stage in such a way as to influence a hoped-for outcome -- for example, by making sure that the web-based technology was thoroughly tested and the online instructors thoroughly trained to use it effectively. This study, on the other hand, uses the data from classes that were taught in the past, without awareness by students or teachers that student achievement data would later be used in a comparative study. As a result there could be no bias on the part of researchers, whether inadvertent or otherwise.

In addition to assessing the comparative effectiveness of online learning, this study had another, more purposeful objective, which was to pinpoint those areas in which the allocation of limited resources might have the greatest impact on the improvement of student learning in online accounting classes. To this end, the study’s framework included a comparison of student ratings of their instructors: If the study were to show instructor ratings to be substantially lower in online classes, it would suggest that better training and mentoring of online instructors could have a substantial positive impact on student achievement. Another improvement-related aspect of the framework was the disaggregation of overall results into four major subject areas: financial accounting, tax accounting, cost/managerial accounting, and auditing. If the study were to show a substantially lower level of achievement in any of these individual subject areas, resources could be directed toward the improvement of online course content, pedagogy, and instructor effectiveness in those areas.

METHODOLOGY

The research question: Is student learning in an online accounting program at a level equal to the learning that occurs in a traditional on-campus classroom? And the corollary: If not, can online learning be brought up to the level of onsite learning, and if so, how?

To respond to these questions, four metrics were used:

1. Student achievement of learning outcomes, as measured by internally generated standardized tests – the principal metric to measure learning
2. Course grades, using class grade point averages
3. Student self-assessment of their learning, as measured by student ratings on an end-of-course student evaluation form
4. Student evaluation of instruction, also measured by ratings on an end-of-course student evaluation form – a principal metric for improving student learning in online courses

Student achievement of learning outcomes

As one direct method of assessing student achievement of program learning outcomes, the business school has, since 2003, been administering standardized tests called Standard Learning Outcome Achievement Test (SLOAT) for several (though not all) courses within each of its programs. The tests are prepared by department faculty, and are sent to instructors a few weeks prior to the end of the course. Test scores from 19 onsite upper division accounting classes were compared with scores from an equivalent number of online classes during a two year period from July 2007 to June 2009. Tests in onsite accounting classes are generally closed-book. By necessity, tests in online classes are open-book, but there is a time limit that impedes students' ability to look up answers in the book, and in fact, questions are designed to preclude the finding of answers in the textbook or lecture notes. Initially there was concern that since the instructors were given the exam questions in advance, they would be prone to teach to the exam and that the scores would not be representative of student achievement of the learning outcomes. However, since the questions generally call for critically thought-out application of concepts rather than memorized responses, teaching to the exam is not practicable. Also, the "C+" average exam grades suggest that instructors do not focus on the same or similar questions, and that online students' access to textbooks and notes does not guarantee high scores.

Course Grades: Whereas SLOAT exams are administered for many but not all courses in the B.S. in Accountancy program, class mean GPA and course/instructor evaluation data are available for all sections of all National University courses. Letter grades with plus/minus intervals are converted to grade points on a traditional scale of 0 to 4, with an "A" providing 4.0 grade points, A- providing 3.7 grade points, and so on. As a way of countering a tendency toward grade inflation, the university has established class GPA targets of 2.75 for undergraduate courses and 3.25 for graduate courses.

Student self-assessment of learning: Among the questions on the end-of-course evaluation survey is a group of seven questions which ask the student to assess their learning experience on a 5-point Likert scale ranging from 1 = Strongly Disagree, to 5 = Strongly Agree. "NA" is used for questions not applicable to this course. Students are asked to rate the degree to which they improved their writing skills, oral communication skills, communication skills, research skills, and the like. Since significant improvement of all these skills would not be expected in every course, one general question was used rather than the mean of all seven questions. The general question considered applicable to all courses is: "I gained significant knowledge about this subject."

Student evaluation of instruction: In addition to the questions relating to student self-assessment of their learning, the end-of-course evaluation survey contains a group of questions relating to teaching effectiveness. The resulting computer report for each class shows: (a) the mean for each of the teaching-related questions, (b) the mean of those means (anathema for statisticians), and (c) the mean response to the general question: "Overall, the instructor was an effective teacher." At the time students complete the end-of-course survey, they cannot be certain what grade the instructor will award, but they are able to

gauge the instructor's level of grading rigor from their scores on midterm exams, assignments and other grading factors. Indeed, Feldman's (1976) review of prior studies cited evidence of a close correspondence between actual and expected grades, and that in studies that used both, there was no substantial difference in results. Stumpf & Freedman (1979) found a similar close relationship between expected grades and actual grades.

DATA ANALYSIS AND DISCUSSION

Metric No. 1: Standard Learning Outcomes Assessment Test (SLOAT) Scores

The courses in which SLOAT tests were administered included Financial Accounting (Intermediate), Federal Taxation, Cost/Managerial, and Auditing. The same Standard Learning Outcome Achievement Test for a given course was administered in both the onsite and online sections of the course. In the aggregate 189 tests were administered in 19 onsite sections taught by nine different instructors. 372 tests were administered in an equal number of online classes taught by seven different instructors. As indicated by these numbers, the average size of the 19 onsite classes was 9.9 students, whereas the average size of online classes was 19.6 students. Since many of the students who took the Intermediate Accounting tests were the same students who took the test for the Tax, Cost/Managerial, and Auditing courses, the numbers 189 and 372 represent the number of tests administered, not the number of different students who took the tests. Since two to three onsite sequences and two online sequences of B.S. in Accountancy courses are offered each year, it is estimated that over the two-year period for which SLOAT scores were analyzed, the number of different students who took these tests was approximately one-quarter the number of tests administered.

SLOAT tests are graded on a scale of 0 to 4.0. The mean score achieved on the 189 tests in onsite classes was 2.93. The corresponding mean score for the 372 tests administered in online classes was 2.80, which was lower than the onsite mean by 4.4%. As indicated in the SLOAT score row of Table 1 below, the null hypothesis of mean score equivalency is rejected, and as such, the online scores are considered significantly lower than the onsite scores.

Figure 1: Aggregated mean SLOAT scores for all four subject areas of upper division B.S. in Accountancy courses

Metric No. 2: Course Grades (GPA)

During the two-year period there were 61 onsite sections and 70 online sections of the twelve upper division accounting courses. The mean GPA for the 61 onsite classes was 3.00. The corresponding mean GPA for the 70 online classes was 2.86, which was lower than the onsite mean by 4.7%. As indicated in the Grades (GPA) row of Table 1 below, the null hypothesis of mean score equivalency is rejected, and as

such, the grades earned in online classes are considered significantly lower than the grades in onsite scores. It is interesting to note that the difference in GPA means is within 0.3 percentage points of the difference in SLOAT means, with almost identical p-values resulting from the t-tests. While this might suggest that SLOAT scores, which make up a small percentage of a student's grade for the course, are highly correlated to course grades, the relationship is less clear when each of the major subject areas are viewed individually.

Table 1 : t-test results for four metrics applied to the aggregate of major subject areas

	Scale	<i>n</i> Onsite	<i>n</i> Online	Mean / SE Onsite	Mean / SE Online	t-Stat	P value	Signifi- cant?	% Diff
SLOAT score	0:4	189	372	2.93 / 0.04	2.80 / 0.03	2.3520	0.0191	Yes	4.4%
Grades (GPA)	0:4	61	70	3.00 / 0.05	2.86 / 0.04	2.3542	0.0203	Yes	4.7%
Learning self-assessment	1:5	61	70	4.30 / 0.07	4.19 / 0.07	1.1503	0.2521	?	2.6%
Teaching evaluations	1:5	61	70	4.40 / 0.06	4.01 / 0.08	3.9744	0.0001	Yes	8.9%

Metric No. 3: Self-Assessment Of Learning

Data for the students' self-assessment of their learning were obtained from end-of-course surveys for the same classes as for class GPAs. Using a Likert scale of 1 to 5, the mean for onsite classes was 4.30. For online classes it was 4.19, less than 3% lower than for onsite classes. The high p-value for this metric indicates insufficient evidence to reject the null hypothesis, leaving the reader to decide whether the approximately 3% difference is significant.

Metric No. 4: Teaching Evaluations

Student responses to end-of-course surveys from the same classes as for their self-assessment of learning provided their perception of their teacher's effectiveness. The mean for onsite classes was 4.40, and for online classes, 4.01, almost 9% lower. Here, the t-test clearly showed the difference to be statistically significant, and the percentage of difference was substantially greater than for the other measures. The relevance of this indicator is discussed below in the Summary of Findings and Conclusion.

DISAGGREGATION INTO FOUR MAJOR SUBJECT AREAS

Since three of the four metrics indicated significantly lower results for the online classes, a disaggregation of the data was performed in order to determine if the overall results might be skewed by an extreme in one or more of the major subject areas, those areas being Financial Accounting (Intermediate and Advanced Accounting), Taxation (Individual and Business), Cost/Managerial Accounting, and Auditing.

Financial Accounting Courses

For the financial accounting courses (Intermediate Accounting), there were ten onsite classes with an average class size of just under seven students in which 69 SLOAT tests were administered by five different instructors. And nine online classes with an average class size of about 22 students in which 194 SLOAT tests were administered by six different instructors.

Figure 2: Mean SLOAT score for Financial Accounting courses

Table 2 :t-test results for four metrics applied to Financial Accounting courses

	Scale	<i>n</i> Onsite	<i>n</i> Online	Mean / SE Onsite	Mean / SE Online	t-Stat	P value	Signif i- cant?	% Diff
SLOAT score	0:4	69	194	2.99 / 0.07	3.05 / 0.04	-0.7696	0.4432	?	-2.1%
Grades (GPA)	0:4	22	27	2.82 / 0.08	2.75 / 0.06	0.7057	0.4845	?	2.4%
Learning self-assessment	1:5	22	27	4.31 / 0.06	4.30 / 0.09	0.0594	0.9529	?	0.1%
Teaching evaluations	1:5	22	27	4.43 / 0.05	4.20 / 0.11	1.8927	0.0662	?	5.2%

Financial accounting was the one category of courses in which student performance in online classes as measured by SLOAT tests was higher, if only by about 2%, than the performance of onsite students. Since most of the students taking financial accounting courses are the same students as those taking classes in the other three subject areas, differentials in means cannot be attributed to differences in student populations among the four areas. Since p-values exceed .05 for all four metrics, there is insufficient evidence to reject the null hypothesis of mean equivalency, leaving it to the reader to judge the significance of the difference in means.

Income Tax Courses

SLOAT tests were administered to 20 students in three of the onsite tax classes taught by two different instructors, and to 75 students in five online classes taught by three different instructors. The average class sizes were seven and fifteen, respectively.

Figure 3: Mean SLOAT score for Income Tax courses

Table 3: t-test results for four metrics applied to Income Tax courses

	Scale	<i>n</i> Onsite	<i>N</i> Online	Mean / SE Onsite	Mean / SE Online	t-Stat	<i>P</i> value	Signifi - cant?	% Diff
SLOAT score	0:4	20	75	2.46 / 0.16	2.01 / 0.07	2.5163	0.0184	Yes	18.3%
Grades (GPA)	0:4	10	11	3.25 / 0.12	2.78 / 0.08	3.2441	0.0051	Yes	14.4%
Learning self-assessment	1:5	10	11	4.26 / 0.22	3.86 / 0.23	1.2771	0.2169	?	9.5%
Teaching evaluations	1:5	10	11	4.32 / 0.23	3.56 / 0.20	2.4909	0.0114	Yes	17.5%

SLOAT scores were substantially lower in tax classes, both onsite and online, than for classes in the other three subject areas. And with an online mean score more than 18% lower than the onsite mean score, the difference between the two was far greater than for the other three subject areas.

Cost/Managerial Courses

SLOAT tests were administered to 45 students in five of the onsite cost/managerial classes taught by three different instructors, and to 54 students in two online classes taught by one instructor. The average class sizes were 9 and 27, respectively. The mean of the SLOAT scores for online students was approximately 3% lower than for onsite students. While mean GPAs were identical at 2.88, online students' self-assessment of their learning was higher by almost 9% than the corresponding assessment by onsite students in these cost/managerial classes. As with the financial accounting courses, p-values exceeded .05 for all four metrics suggesting insufficient evidence to reject the null hypothesis and leaving it to the reader to judge the significance of the difference in means.

Figure 4: Mean SLOAT score for Cost/Managerial courses

Table 4 : t-test results for four metrics applied to Cost/Managerial courses

	Scale	<i>n</i> Onsite	<i>n</i> Online	Mean / SE Onsite	Mean / SE Online	t-Stat	<i>P</i> value	Signifi - cant?	% Diff
SLOAT score	0:4	45	54	2.93 / 0.10	2.85 / 0.07	0.6923	0.4907	?	2.8%
Grades (GPA)	0:4	11	8	2.88 / 0.14	2.88 / 0.05	0.0074	0.9942	?	0.0%
Learning self-assessment	1:5	11	8	4.11 / 0.26	4.48 / 0.07	-1.3834	0.1940	?	-8.9%
Teaching evaluations	1:5	11	8	4.46 / 0.14	4.43 / 0.05	0.1891	0.8532	?	0.6%

Auditing Courses

SLOAT tests were administered to 55 students in four of the onsite auditing classes taught by three different instructors, and to 49 students in two online classes taught by two different instructors. The average class sizes were 13.9 and 24.5, respectively. The mean of the SLOAT scores of the online students was approximately 3% lower than the mean of the onsite students, very close to the overall

percentage difference for all courses in the program, and close also to two of the other three major subject areas.

Figure 5: Mean SLOAT score for Auditing courses

Table 5: t-test results for four metrics applied to Auditing courses

Once again, *p*-values exceeded .05 for all four metrics, indicating insufficient evidence to reject the null hypothesis of mean equivalency.

Income Tax Courses: The Aberration

As noted under Income Tax Courses above, and as illustrated in Exhibit 6, below, the difference in standard assessment test means between onsite and online was more than twice the average difference of the other three subject areas. But it is also important to note that the online scores for income tax courses were not the only ones that were well below those for the other three subject areas... scores in onsite classes were also well below those for the other areas, which suggests the need for a comprehensive review of course content, teaching strategies, and instructional quality of the onsite as well as the online tax classes.

Figure 6: Mean SLOAT scores for each subject area

All Courses *Except* Income Tax

Since the income tax courses showed a much greater difference between online and onsite student achievement than did the other three subject areas, an analysis was performed on aggregated data for all subject areas *except* the income tax courses, with the following results:

Figure 7: Mean SLOAT score for all courses except Income Tax

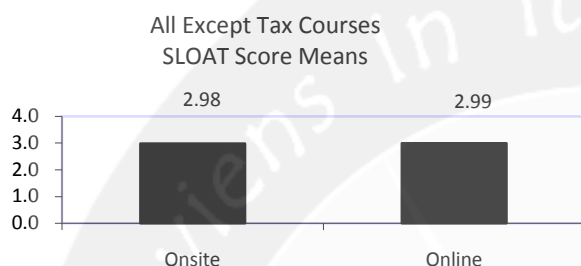

Table 6 : t-test results for four metrics applied to all courses except Income Tax

	Scale	" Onsite e	" Online e	Mean Onsite	Mean Online	t-Stat	P value	Signif i- cant?	% Diff
SLOAT score	0:4	169	297	2.98 / 0.04	2.99 / 0.03	-0.1925	0.8475	?	-0.3%
Grades (GPA)	0:4	51	59	2.96 / 0.05	2.87 / 0.04	1.236	0.2196	?	2.7%
Learning self-assessment	1:5	51	59	4.31 / 0.07	4.25 / 0.07	0.577	0.5652	?	1.3%
Teaching evaluations	1:5	51	59	4.41 / 0.05	4.10 / 0.08	3.268	0.0015	Yes	7.1%

When income tax courses were excluded, aggregated mean scores on standard assessment tests for all other courses were almost identical at 2.98 for onsite and 2.99 for online classes. The one metric for which the online courses continued to show a statistically significant lower value was the student rating of instruction, i.e. teaching evaluations.

SUMMARY OF FINDINGS AND CONCLUSION

Though there were inconsistencies among the four metrics, it is fair to conclude on the basis of student performance on standard assessment tests that the level of student learning in online accounting classes was significantly lower than the learning that occurred in traditional onsite classes. However, when the especially large difference in the income tax courses was excluded, the aggregate mean scores on the standard assessment tests for all other courses were virtually identical. This suggests that a comprehensive review of the course content and instructional design of the online tax courses, along with improved teaching strategies and teacher effectiveness are likely to result in improved student learning in these courses.

There are a number of other factors that could have contributed to an overall lower level of achievement in the online classes: For example, the average class size of the online classes was more than twice that of the onsite classes, suggesting that onsite students had more opportunity to interact and were more likely to get individual help from the instructor. Also, many students opt for online classes because they perceive (mistakenly) that online courses are less demanding of their time, which, for the working adults who comprise the majority of this university's student body, is in short supply. The almost 9% difference in

student ratings of the instructor suggests that the instructors of online classes were considered by their students to be substantially less effective as teachers. This could be caused in part by online students expecting, or at least desiring, the same lecturing and whiteboard solution-building as they have been accustomed to in a traditional classroom. However, this expectation appears to have diminished as students progressed through the program, since the differences in teaching evaluations were greater in the early financial accounting courses than for the auditing courses that came at the end of their program. It is likely that the factor which contributed more to the lower evaluations of the online instructors was (and is) the less-than-thorough training and monitoring of instructors on adjustments to teaching strategies and on ways to make effective use of the online functionality. And insufficient emphasis regarding online students' need for almost "24/7" interaction and responsiveness to their communications. Inadequate training and mentoring are correctable deficiencies, and to the extent that they contributed to the lower student achievement in online classes, an appropriate response to these instructor-related deficiencies is likely to have a significant positive impact on student learning in online accounting classes.

BIOGRAPHY AUTHOR'S

Don Schwartz received his accounting degree from Columbia University along with a law degree from New York University. After a tour of duty with the U.S. Navy, he joined the staff of Touche which later merged with Deloitte. He was one of the early pioneers in computer accounting services for accounting practitioners, with several of his articles published in the *Journal of Accountancy* and in *The CPA Journal*. He joined the fulltime faculty of National University in 1989 and is currently chair of the Accounting & Finance Department in National's School of Business and Management.

DETERMINANTS OF CITRUS (KINNOW) EXPORTS FROM PAKISTAN

Samia Tanzeel, University of Agriculture Faisalabad, Pakistan

Khalid Mustafa, University of Agriculture Faisalabad, Pakistan

ABSTRACT

The paper identifies major determinants and explores their impact on the export of Citrus (kinnow) from Pakistan to three selected Countries (Russia, Iran and Dubai). Data collected from primary and secondary sources were analyzed to estimate impact of major variables on the export of Citrus (kinnow) from Pakistan. Double log form of regression analysis was employed to estimate effect of selected variables on the export of kinnow in the selected Countries. Comparative study of export margins in the three selected markets revealed that Iran was the high profit market whereas Russia and Dubai were moderate profit markets. The results of analysis of primary data revealed that experience of exporters, average sales price of kinnow, average marketing cost, average freight charges and ISO certification were significant determinants of kinnow exports from Pakistan. On the other hand, results of analysis of secondary data showed that domestic production of the fruit, exchange rate and relative prices significantly affected kinnow exports. The Paper underlines the need for strengthening the domestic production base, adherence to the international Quality standards and adoption of modern methods of handling and transportation of the fruit for targeting the high value export markets.

KEYWORDS: Determinants, Export, Citrus (Kinnow)

INTRODUCTION

Kinnow (Mandarin) has assumed special economic importance due to its high juice contents, special flavor, delicious taste and nutritional composition. Share of kinnow in total citrus production in Pakistan is more than 70 percent. Pakistan is the sixth largest producer of kinnow (mandarin) and oranges in the world. Kinnow orchards are primarily located in Sargodha, Mianwali, Khushab, Mandi Bahauddin, Multan, Jhang, Lehea, Toba Tek Singh, and Bhalwal districts of Punjab. Kinnow season starts in mid-November and extends normally up to April (Syed, 2009).

Kinnow being a valuable commercial commodity generates foreign exchange through export. During 2007-08, Pakistan earned about 145,760 thousand US dollars from the export of fruits, of which kinnow alone contributed approximately 36 percent to the foreign exchange earnings (TDAP, 2008). Kinnow exports during 2008-09 were valued around 45044 thousand US dollars (GOP, 2009).

Exports of kinnow from Pakistan are primarily directed to low or middle income countries. Although some exporters export kinnow in developed world but they have to face different regulations and standards. Exporters incur relatively more serious problems in meeting SPS standards in the developed world. SPS measures adopted by low and middle income countries are however, comparatively less severe or weakly enforced, therefore large quantities of kinnow from Pakistan are channeled to low and middle income countries. Major importers of Pakistani kinnow are Iran, Russia, Dubai, Saudi Arabia, Bahrain, UAE, Sri Lanka, Kuwait, Philippines, and Afghanistan.

Many factors have set limits in the export of kinnow from Pakistan. Amongst others, lack of adoption of international standards/requirements in the marketing of fruits, conventional methods of handling, improper orchard management resulting in high post-harvest losses and poor quality of fruits, poor mode of transportation, lack of cold storage, fluctuating domestic production, inconsistent export policies,

currency devaluation, competitiveness of exports and situation in the international markets are important determinants of kinnow exports from Pakistan. (Haleem *et al.*, 2005).

The present paper seeks to identify and analyze major determinants and their impact on the export of kinnow in some selected counties (Russia, Iran and Dubai) from Pakistan. The research is based on collection and analysis of primary and secondary data. Policy options for increasing export of kinnow from Pakistan are outlined in the light of research findings.

METHODOLOGICAL FRAMEWORK

Primary data were collected from some selected kinnow exporters exporting kinnow to Iran, Russia and Dubai. In Pakistan, kinnow orchards are particularly located in Sargodha, Rahim Yar Khan and Toba Tek Singh districts of the province of Punjab. Sargodha was selected for the purpose of undertaking research due to the reason that it is the largest kinnow growing district in the province and largest number of kinnow exporters is also located in this district. Sargodha and Bhalwal tehsils in Sargodha district were further chosen for formal survey. A purposive sampling approach was used. Thirty exporters exporting kinnow to Russia, Iran and Dubai were selected from the two Tehsils. A well-designed and pre-tested questionnaire was constructed to collect information from exporters.

Total quantity of kinnow exports was taken as the dependent variable. Different independent variables used in the model were: education of exporters (number of schooling years of exporters), experience of exporters (number of years in export business), average purchase price at which exporters purchased kinnow, Average activity cost which exporters incurred prior to export of kinnow from Pakistan (cost of processing, transportation, packaging, storage, custom clearance, freight charges and other charges), average sales price of kinnow: A dummy variable (effect of ISO certification on the export of kinnow) was used as a proxy variable for ascertaining exporters perception about the effect of ISO certification on export of kinnow. The quantity of dummy variables was taken as 1 and 0 (1 indicated that exporters of kinnow were ISO certified whereas 0 indicated that exporters were not ISO certified). Double log form of multiple regression models was employed for analyzing data.

The following functional form was used:

$$X_k = f(\text{Ed}, \text{Ex}, \text{P}, \text{Pp}, \text{C}, \text{Fr}, \text{D})$$

Where X_k is export quantity of kinnow (tones); Ed is education of exporters; Ex is experience of exporters; P is price at which exporters exported kinnow in the selected markets; Pp is purchase price at which exporters purchased kinnow from different sources for export; C is Total cost incurred by exporters prior to export of kinnow (Total Cost included processing, transportation, packaging, storage, custom clearance, freight charges and other charges); Fr is Freight charges for different countries. (In the case of aggregate model the variable was included in the cost of different activities while in case of estimated models for three countries (Russia, Iran and Dubai) the variable was considered separately as exporters had to bear different freight charges for different countries); D is Dummy Variable used as a proxy variable to check effect of ISO Certification on exports.

Specific form of relationship is written as:

$$\ln X_k = \beta_0 + \beta_1 \ln \text{Ed} + \beta_2 \ln \text{Ex} + \beta_3 \ln \text{P} + \beta_4 \ln \text{Pp} + \beta_5 \text{C} + \beta_6 \text{Fr} + \beta_7 \text{D} + \epsilon$$

Export margin analysis was also undertaken for estimating profitability of kinnow exporters in three major markets (Russia, Dubai, and Iran). Moreover, gross and net margins of exporters were calculated. Significance of the estimated regression models were tested through Coefficient of Determination (R^2), Analysis of Variance (ANOVA) and Durbin Watson Statistics.

Secondary data were also used to capture effects of variables which had direct or indirect impact on export of kinnow from Pakistan. Data for export supply function were collected for the period, 1978-2008 from various publications of Government of Pakistan.

Total export of kinnow was taken as dependant variable and regressed against different independent variables (i.e. Domestic Production, Relative Price Index, Exchange Rate and high type road length).

Export prices of kinnow were calculated by dividing export value with the quantity exported in the respective year. Relative price index of kinnow was also constructed. Relative Price Index was constructed by keeping 2000 as the base year. The variable reflected profitability of selling kinnow in the export markets relative to that of domestic markets. Relative price index was calculated using the following formula:

$$PI = \frac{\text{Export Prices}}{\text{Domestic Prices}} \times 100$$

Where PI is Relative Price Index of kinnow exports

Data on exchange rate were collected from various issues of Economic Survey of Pakistan; however, data on infrastructural development was not available. As such, high type road length was used as a proxy variable to capture effect of infrastructural development on the exports of kinnow.

RESULTS AND DISCUSSIONS

The results of the estimated models are discussed below.

The Export Model (Primary Data)

Double log form of regression method was used to estimate relationship between dependant and independent variables. Ordinary least Square (OLS) method was employed for analyzing the data. Specific form of the relationship is written as:

$$\ln X_k = \beta_0 + \beta_1 \ln Ed + \beta_2 \ln Ex + \beta_3 \ln P + \beta_4 \ln Pp + \beta_5 C + \beta_6 D + \epsilon$$

Where X_k is Export Quantity (ton); Ed is education of exporter; Ex is experience of the exporters; P is Sales Price; Pp is Purchase Price (Rs/ ton); C is Activity Cost and D is Dummy Variable used for ISO Certification

In the estimated model, the Coefficient of Determination (R^2) was 0.71 which showed that 71 percent variation in the dependant variable was explained by all independent variables. Adjusted R^2 was 0.674. F-value was 15.983 which were greater than tabulated F-value (2.76) and the p-value was less than 0.05. Standard error of the estimated model was 0.26 which revealed that average deviation of points from the estimated regression line was 0.26. The model was significant as standard deviation in the model was small. The value of Durbin Watson Statistics was 2.159 which suggested that there was no autocorrelation between variables. Goodness of fit and significance of coefficients in the regressed model were also checked through signs of coefficients and t-value of each coefficient.

Results of the estimated model are presented in Table: 1

Table 1: Estimated Model

Variables	Coefficients	t-Value	Significance
Constant	9.740	1.576	0.129
Ln Ed (Education)	0.230	0.860	0.399

Ln P (Sales Price)	0.627	1.931	0.066***
Ln Pp (Purchase Price)	-0.478	-1.812	0.083***
Ln C (Activity Cost)	-0.528	-1.690	0.105***
D (Dummy for ISO certification)	0.374	3.535	0.002*
R ² = 0.719 Adjusted R ² = 0.674			

Significant at 1%*: significant at 5%; Significant at 10%*** levels.

Education of exporter is an important variable in order to undertake all business related activities. Economic logic suggests that there should be positive relationship between education and quantity exported (Ghafoor *et al.*, 2010). Educated persons can interact with stakeholders in an effective manner. In our model, the coefficient of education had positive sign. The value of the coefficient was 0.230 which implied that keeping all other variables constant, for every one percent increase in the education of exporters, there would be 0.23 percent increase in the quantity exported. The variable was however found insignificant.

Professional experience of exporters can effect the quantity exported (Ghafoor *et al.*, 2010; (Mehmood and Sheikh, 2006). In our model, value of experience showed that for every one percent increase in the experience of exporter, kinnow exports would increase by 0.53 percent. The variable was found significant at one percent level of significance.

Average sales price at which exporters export their products in the international market is an important variable as exporter's decision heavily depends upon the price they expect to receive in the foreign market. More expected price would encourage exporters to export more. As such, there exists positive relationship between average sales price and the quantity exported. Value of the coefficient in our model was 0.627 which means that export quantities would increase by 0.627 percent for one percent increase in average sales prices. The variable was also found significant at 10 percent level of significance.

Average purchase price affected exporters decisions about the purchase of kinnow for export. The variable was considered very important as higher purchase price would discourage exporters to export kinnow. Hence a negative relationship existed between purchase price of kinnow and quantity exported. In our model, for every one percent increase in the price of kinnow at which exporters purchased kinnow, export quantity would decrease by 0.478 percent. The variable was also found significant at 10 percent level of significance.

Activity costs mean cost of transportation, processing, packaging, grading, storage etc. Exporters of kinnow will export fewer quantities in case of higher activity cost. Coefficient of activity cost in our model was 0.528 which implied that for every one percent increase in the cost incurred by exporters to perform different activities, exports would decrease by 0.528 percent keeping all other variables constant. The variable was found significant at 10 percent level.

ISO certification was used as a dummy variable to check exporter's perception about the standards/quality. Most of the exporters had obtained ISO certification. In addition, some exporting firms had obtained certified HACCP (Hazard Analysis and Critical Control) and cool chain system to extend shelf life of kinnow (Mustafa *et al*, 2007). The exporters, who were ISO certified, were exporting almost 0.374 times more than the exporters who did not have ISO certification. The variable was also found highly significant, reflecting importance of ISO certifications in the export process.

Export Margin Analysis

This section delineates profitability of exporters in three major markets (Russia, Iran and Dubai). From a representative sample of thirty Exporters in District Sargodha more than 70 percent of the selected Exporters exported kinnow to Russia, Iran and Dubai. These markets were selected for finding out profitability of kinnow exporters. Three main elements of profitability were analyzed (a) Gross margins, (b) Net margins and (c) Percent export margin.

Data were collected about average purchase price, average sales price and average marketing cost. Average marketing cost for estimating export margins covered cost of processing, transportation, packaging, storage, custom clearance, freight charges and other charges. Export margins for three major markets were estimated separately.

Export Margin Analysis For Russia

Russia is an emerging market for Pakistani kinnow exporters. There is huge potential for exporters to export kinnow in Russia. The Russian markets demand small sized kinnow. As such, Pakistani kinnow is highly demanded in Russia due to high juice contents and delicious taste. The prices of kinnow, in the importing country are however low mainly due to non-compliance of SPS measures by the exporters. Out of 30 exporters, 22 exporters exported kinnow to Russia. Export margins of the 22 exporters are presented in Table II.

Table II: Export Margins Analysis (Russia)

Activity (Rs. Per Ton)	Minimum	Maximum	Mean	Std.Deviation
Sales Price	48997.30	70000.00	54036.52	5824.36
Purchase price	5000.00	10000.00	7950.00	1394.53
Transportation cost from orchard to kinnow processing factory	250.00	1000.00	865.00	256.54
Processing cost	3000.00	6000.00	4925.00	921.59
Cold storage cost	1000.00	2500.00	1400.00	475.72
Packaging material cost	1000.00	3000.00	1850.00	454.50
Transportation cost from Sargodha to Karachi	1000.00	4000.00	2650.00	919.09
Custom clearance Charges	500.00	750.00	628.00	91.11
Freight Charges	18000.00	20000.00	18900.00	852.24
Gross Export Margin			46086.52	
Percent Export Margin			85%	
Net Export Margin			14868.52	

Average sales price of kinnow in Russia was Rs.54037 per ton. Average purchase price was Rs.7950 per ton. Gross margin of exporters for Russian markets was estimated as Rs.46087 per ton. Gross margin of exporters in total sales was about 85 percent. 13 percent of this amount was paid to agents of exporters in Russia. Net margin of exporters was calculated after deducting all marketing costs which amounted to Rs.14867. Net margin for Russian markets was relatively low due to high freight charges as most of the

exporters shipped kinnow by Sea. Corrugated and wooden boxes were used for the export of kinnow to Russia. Packaging size was almost 6-8 kg and average kinnow placed in one crate numbered 56-72.

Export Margin Analysis For Iran

Iran is one of the largest markets for Pakistani kinnow. Exporters had to pay relatively less freight charges for kinnow to Iran as export was channeled by road. Exporters are not allowed to export kinnow to Iran by Sea as Iran has not allowed import of citrus fruit by Sea. Export of kinnow to Iran from Pakistan is therefore channeled by land (PHDEC, 2010). Iran was a favorite market for Pakistani exporters due to higher returns on export of kinnow. It was recorded that out of thirty exporters, 25 exporters shipped large volume of kinnow to Iran.

Table III: Export Margins of Exporters from Export of kinnow to Iran

Activities (Rs. Per Ton)	Minimum	Maximum	Mean	Std. Deviation
Sales Price	5000.00	100000.00	64573.66	19844.38
Purchase price	5000.00	10000.00	7695.65	1743.42
Transportation cost from orchard to kinnow processing factory	250.00	1000.00	869.56	236.80
Processing cost	3000.00	6000.00	4956.52	1021.50
Cold storage cost	1000.00	2500.00	1478.26	487.99
Packaging material cost	1000.00	3000.00	1706.52	514.84
Transportation cost from Sargodha to Karachi	1000.00	3500.00	2369.56	944.08
Custom clearance Charges	500.00	750.00	599.13	84.68
Freight charges	3000.00	5000.00	4260.86	619.18
Gross Export Margin			56878.01	
Percent Export Margin			88%	
Net Export Margin			40637.53	

Table III shows that gross margin of exporters for Iran was Rs.56878.0126 per ton. However, Net margin of exporters was relatively high due to less freight charges. Estimated net margins for exporters were Rs.40637.5344 per ton which was higher when compared with Russia and Dubai. Exporter's share in the total margin was calculated as 88 percent whereas 12 percent share was paid to agents of exporters in Iran.

Export Margin Analysis For Dubai

Traditionally Dubai is the largest market for kinnow exporters from Pakistan. Pakistani kinnow is highly demanded by consumers as most of the Pakistani immigrants are settled in Dubai. It was observed that out of thirty exporters, 24 were exporting large quantities of kinnow to Dubai. Export margins of exporters are presented in table IV.

Exporters used corrugated boxes for export purpose. Packaging size of one crate was 8-10 kg. On an average 36-48 kinnow were positioned in one crate. Average sale price of kinnow in Dubai market was Rs. 61781 per ton, while average purchase price of kinnow in Pakistan was Rs.7909 per ton. Gross margin of exporters for Dubai market was estimated Rs.53872 per ton. Average marketing cost was Rs. 18610 per ton which included all costs (i.e. transportation cost, processing cost, storage cost, packaging material cost, custom clearance and certification charges and freight charges). Net margin of exporters was Rs.35262 per ton which was lesser when compared with Iran. Most of export consignments to Dubai were shipped by Sea. Margin of exporters was 87percent whereas 13 percent was obtained by agents who sold out kinnow in the Dubai market.

Table IV: Export Margins of kinnow Exporters (Dubai)

Activity (Rs. Per Ton)	Minimum	Maximum	Mean	Std.Deviation
Sales Price	47272.72	66502.56	61780.62	4419.91
Purchase price	5000.00	10000.00	7909.09	1540.22
Transportation cost from orchard to kinnow processing factory	250.00	1000.00	809.09	272.83
Processing cost	3000.00	6000.00	4704.54	1007.81
Cold storage cost	1000.00	2500.00	1545.45	485.72
Packaging material cost	1000.00	3000.00	1818.18	470.44
Transportation cost from Sargodha to Karachi	1000.00	4000.00	2477.27	969.50
Custom clearance charges	500.00	750.00	619.09	88.42
Freight Charges	4000.00	8000.00	6636.36	1002.16
Gross Export Margin		53871.53		
Percent Export Margin		87%		
Net Export Margin		35261.53		

Export Supply Function (Secondary Data)

Time series data were used for estimating export supply function. Data were collected for the years, 1978-79 to 2007-08 from various publications of Government of Pakistan. Total Exports of kinnow was regressed against domestic production, Relative Price Index, exchange rate and high type road length (proxy variable used to capture effects of infrastructural developments).

Table V: Data for Export Supply Function (1978-2008)

Variables	Minimum	Maximum	Mean	Standard Deviation
Export Quantity (000 kg)	19688.00	214765.00	59660.56	52387.47
Domestic Production (000 kg)	737100.00	2294000.00	1.6327E6	382314.0
Road Length (000 kilometers)	34.80	175.00	102.29	47.19
Exchange Rate (Rs in Terms of \$)	9.90	62.55	32.94	19.82
Relative Price Index	51.44	158.72	91.08	24.33

Augmented Dickey Fuller test (Dickey and Fuller, 1981) was used to check presence of unit root in time series data. Results are presented in Table VI

Data series of different variables were tested for the presence of unit root. Computed absolute value of all variables was less than critical values (-2.97) in level form. All variables used for determining export supply function were non stationary in their level form.

All variables were checked in 1st difference form. Results presented in table VI show that values of all variables were greater than critical values. Data series were thus stationary at first difference. As such, all variables in the model were integrated of 1 (1).

Double log form of regression method was employed to estimate relationship between export supply of kinnow and independent variables.

Table VI: Unit Root Test in Level and 1st Difference Form

Variables	Level Form	1 st Difference Form
Export Quantity	-2.17	-3.319
Domestic Production	-2.65	-3.70
Road Length	-0.27	-2.99
Exchange Rate	-0.19	-3.1
Relative Price Index	-1.91	-4.125
Critical Values	-2.97	-2.97

The following functional form was used to estimate export supply function of kinnow for exports.

$$\ln E_s = \beta_0 + \beta_1 \ln D_{\text{pro}} + \beta_2 \ln \text{PI} + \beta_3 \ln \text{ER} + \beta_4 \ln \text{RL} + \epsilon$$

Where E_s is export supply of kinnow; D_{pro} is domestic production of kinnow; PI is relative price index of kinnow exports (1999-2000=100); ER is exchange rate (Rs in terms of Dollars); RL is high type road length (used as proxy variable for infrastructural development).

Results of the estimated model are presented in table VII.

Table VII: Export Supply Function of kinnow

Variables	Coefficients	t-Value	Significance
(Constant)	-12.697	-1.506	0.145
Ln D_{pro} (Domestic Production)	2.330	3.450	0.002*
Ln ER (Exchange Rate)	2.511	4.783	0.000*
Ln PI (Relative Price Index)	3.637	4.750	0.000*
Ln RL (Road Length)	0.444	1.354	0.188
$R^2 = .84$	Adjusted $R^2 = 0.808$		
F-Value = 31.638	Durbin Watson Statistics= 1.565		

Significant at 1%*; significant at 5%**; Significant at 10%***

The Coefficient of Determination (R^2) of the estimated model was 0.84 which implied that 84 percent variation in the dependant variable was explained by independent variables included in the model. Adjusted R^2 was 0.808. F-value was 31.638 which were greater than the tabulated F-value. P-value was less than 0.05. As such, the model was found significant at 5 percent level of significance. Value of Durbin Watson Statistics was 1.565 and showed absence of autocorrelation between variables.

Domestic Production was considered as one of the most important variables affecting export of kinnow. Economic logic suggests that more production generates more exportable surplus showing positive relationship between domestic production and exports (Gunawardana et al., 1995; Haleem et al., 2005). In

our model, value of coefficient for domestic production was 2.33 which implied that for every one percent increase in domestic production of kinnow its export would increase by 2.33 percent, keeping all other variables constant.

Theoretically, an increase in the value of dollars implies depreciation of home currency (Rupees). Dollar has become dearer overtime. As such, relative value of rupee has fallen. Depreciation of Rupees in dollar terms will mean an increase in exports. This means that there is positive relationship between depreciation of Rupee (in terms of Dollars) and total exports (Mencet et al., 2006), (Haleem et al., 2005). The value of the coefficient in our model was 2.51 which revealed that keeping all other variables constant, exports would increase by 2.51 percent for one percent depreciation of Rupee in terms of Dollars. The variable was found significant at 1 percent level of significance.

Relative price index of kinnow exports shows profitability of selling in the export markets as compared to selling in the domestic markets. Price factor plays an important role in explaining variation in exports. Higher export prices relative to domestic prices lead to more exports in the international market. Gunawardana *et al.*, (1995) used relative price index of exports for agricultural commodities to check profitability of selling in the export markets relative to domestic markets. The value of coefficient for relative price index of exports was 3.63 in the estimated model which revealed that one percent increase in the value of relative price index would increase exports by 3.63 percent. The variable was also found significant at 1 percent level of significance.

As stated earlier, length of high type roads was used as a proxy variable for infrastructural development. Infrastructure leads to better transfer of products between production and consumption. In our estimated model, value of the coefficient was 0.44 which revealed that for one percent increase in the length of high type roads, exports would increase by 0.44 percent. The variable had however no significant effect on export of kinnow from Pakistan.

CONCLUSION

The research was undertaken to identify major determinants and explore their impact on the export of kinnow from Pakistan. The research was based on collection and analysis of both primary and secondary data. Analysis of data collected from the exporters of kinnow revealed that professional experience, average sales price, average purchase price, average marketing cost and ISO certification significantly affected export of kinnow while education of exporters had no significant impact on the export of kinnow. Profitability of kinnow exporters was checked through export margin analysis for three major exporting markets (i.e. Russia, Iran and Dubai). The analysis revealed that Iran was the most attractive market for exporters due to high profitability as compared to Russia and Dubai. Export supply function for kinnow was estimated for Pakistan by analyzing time series data. Analysis of data revealed that domestic production, exchange rate and relative price index affected export of kinnow while high type road length had no significant impact on exports.

The research findings point out that major hurdle in the export of kinnow from Pakistan is lack of adoption of international standards. At present, export quality standards for kinnow are not strictly implemented by exporters and enforced by regulating authorities. To promote kinnow exports from Pakistan, quality standards should be implemented by the stakeholders according to the requirements of importing countries.

Inspite of rapid increase in the demand for kinnow in the world, exporters of kinnow in Pakistan have focused only on middle and low income countries. New export markets should be explored by organizing trade exhibitions/trade shows particularly in the developed countries.

Exporters can earn high profit from the export of kinnow by establishing cartels to control abundant supply of kinnow from Pakistan to fetch high prices from kinnow exports.

In Short, there is strong need for strengthening the domestic production base, adherence to the international Quality standards and adoption of modern methods of handling and transportation of the fruit for targeting the high value export markets.

ABSTRACT

The Brazilian Post Office has its origin from the discovery of Brazil in 1500 and since then has been modernized by creating and providing quality services which meet the expectations of its customers. This new attitude will help the company become a "world class", which through its practices and results. This study aimed to evaluate the changes in the aspects related to the improvement of the revenue recovery, as regards the amount and cost of photocopying, creating a digital archive and improving the institutional climate, is directly reflected in the final cost of process and quality of life of analysts. Through the analysis of results can be observed that the use of some tools of the Methodology for Analysis and Solutions of Problems worked on suggestions for improvement proposed in the process under study, so the 40% reduction in the amount and cost of photocopying. There will also a reduction in physical space used by file and improvements that will focus on the routine work of analysts and organizational climate.

KEYWORD: Brazil, Post Office, save, money, problem

INTRODUCTION

In this paper we present an organizational diagnosis, a portrait of the Brazilian Post and Telegraph since its establishment until today, whose goal is to evaluate the changes in the aspects related to improvement in the revenue recovery process. The study is justified in increasing the quantity and cost of photocopying, increased physical space for the file, focusing on the routine work of analysts and organizational climate.

Driven by technological changes, economic and social, from 2009, the Postal Service adopted a new corporate identity, taking a proactive stance in front of customers, society, employees and government. In addition to offering and delivering products and services, the Post began to better understand the demands of society, generating solutions to bring people and organizations, wherever they are. More than honor all commitments to customers, the Postal Service wants to anticipate your needs and practicing sustainability to the development of business and balance economic, environmental and social. This new attitude contributes to the Brazilian Post and Telegraph to become in the future, a company of "world class", which through its practices and results.

We demonstrate here the contributions of total quality program, the quality of work life, aiming at evaluating the changes in the aspects related to the improvement of the revenue recovery, with regard to the quantity and cost of photocopying, creating a digital archive and improve the organizational climate, which reflect directly on the final cost of the process and quality of life of analysts.

The methodology used is the "Method of Analysis and Troubleshooting". The same is focused on identifying problems and consequently development of corrective and preventive actions to eliminate or minimize the problems identified.

Postmen

LITERATURE REVIEW

Post offices are linked to Brazil since its discovery, after all, nobody knows that the birth certificate of our country was a letter written by Pero Vaz de Caminha (1450-1500), clerk of the fleet of Pedro Alvares Cabral (1467 - 1520) , D. Manuel I (1469-1521), The Fortunate, King of Portugal. One can therefore consider that the postal service in Brazil began to work immediately after its discovery, since it also present in other Portuguese expedition should have sent letters to their relatives and friends of the court to tell them the news, since founded Brazilian Post Offices have been increase all services.

First Brazilian Label - “Olho-de-Boi”

DATA AND METHODOLOGY

Values and organizational

Vision: To be a world class company.

Values: ethics, meritocracy, respect for people, customer commitment and sustainability.

Quality policy: The customer is the primary recipient of our efforts.

Environmental Policy: Promoting continuously measures and actions aimed at improving their environmental performance, following the principles of sustainable development and environmental protection.

Strategic Objectives:

- Achieving Return on Equity Defined Government
- Reduce Postal Exclusion
- Increase the positive perception of the Company's Image
- Increase operational quality
- Have Met People and Skills Required

Characteristics of Organization: It is currently present in all municipalities and is the largest employer with official register in the country, with over 108,000 employees. In addition, the company has the most complex logistics network national, capable of delivering 30 million items a day and visit 45 million homes daily. Distributed throughout the Brazilian territory, there are 28 regional offices, one in each federal state (in Sao Paulo are two). These boards are charged with implementing agencies at the regional level, the guidelines of the federal government in the four operational subsystems that make up the postal system: care, treatment, transportation and distribution, totaling more than 23 000 service points. The Evening Post Network, runs daily around 56,000 km and carries 650 tons of objects in 31 aircraft of different sizes. Such transport is outsourced, by charter or by the use of regular passengers.

Methods of Analysis and Solutions: Plan, Do, Check and Action

Electronic Document Management The use of paper has disadvantages such as the need for large storage space, paper costs and especially with the time wasted in handling them. The Electronic Document Management can circumvent this problem because it is basically the process of managing information, making your scanning, indexing, compression, storage, protection and distribution. The electronic management of documents also features a wide range of advantages and benefits such as:

Minimization or elimination of paper files enlarging the physical space;

Reduction or elimination of photocopying, reducing the costs of photocopying and speeding the reproduction;

High speed and accuracy in accessing the documents;

simultaneous availability of documents, one document can be accessed simultaneously by multiple employees through the internal network or via the Internet;

Increased productivity due to the agility of internal transactions that can be done in parallel flow. This is reflected in the rapid return on investment;

Security of information about losses and falsification of documents;
Several possibilities for indexing the documents.

Criteria: The study focuses on reducing the amount and cost of photocopying and consequently reducing the cost of the process, reduced overtime, improving the organizational climate. Every year is calculated by the finance company, the time spent on each analyst involved in the process, as well as their financial cost from the entrance to the section of the process until the end of accountability. Consideration was spent with respect to time-telling, survey documents, photocopying, electricity, paper, printer toner, overtime, and other attributes for proper handling of the process from beginning to end. Arrived at a result that is calculated for each process spends \$105.00 (one hundred and five dollars), which he did conclude

that the Regional Board should not retrieve the values of processes whose compensation was less than this value, leaving as burden of Company.

Archive Section

We found that the value established by the Board was a significant reduction as well as regards the quantity of cases to be analyzed, but there was no reduction in photocopying, for processes that fall like burden, belonging to other Regional Boards are copied to file and control section, causing the same cost with the process. Using a digital file, with the help of Regional Boards systems already deployed in the company, which would help in reducing both the amount of paper, place to keep (overcrowded), and especially about the cost of photocopying, also bringing an improvement in the final cost of the process.

RESULTS

Agility in separation processes that motivated their entry into the section;
Reduced amount of paper and file;
Facility in the search process.

PEOPLE

Awareness of the team about the need for assessment and continuous improvement of processes and participation of all concerned; Improvement in quality of life of employees, a fact reflected in the organizational climate of the section;

Quantitative Results

There was an increase in the number of copies reproduced by section of 27% over the period from May/2010 to August/2010, from 2908 to 3984 copies. At the suggestion of implementing a digital archive copies of the quantity would be 2390, which relates to 40% reduction in the number of copies.

Based on the value of each copy is \$0.27 (twenty-seven cents), the cost also has a 27% increase over the period to May/10 August/10, from \$785.6 to \$1,075.68. At the suggestion of implementing a digital archive would has a gain of \$430.28, corresponding to 40% reduction in the cost of photocopying.

Figure 1: Number of Photocopies

Figure 2: Cost of photocopying

Figure 3: Final cost of the process

With the reduction would also have photocopies of a reduction in the value end of the process that would cost \$105.00 to \$63.00.

PEOPLE

There was conducting a field survey in order to verify the satisfaction of analysts in relation to suggestions for improvement made by drawing up a questionnaire with two closed questions, we obtain the results shown in the chart below.

Relying on Management of Inspection which has a total of 61 employees, 15 employees use to search the Section of Information and Data Analysis, which corresponds to 15% of effective management.

Question 1: With the digitization of processes improve your work schedule?

Question 2: The organizational climate section improvement?

Figure 4 :Survey of employee satisfaction section

We obtained 100% acceptance of analysts directly involved with the case both with regard to routine work and for the organizational climate.

Results unmeasured

- 1) Better distribution of tasks;
- 2) Gain in quality of analysis, definitions of responsibility and recoveries revenue;
- 3) Faster access to information processes;
- 4) Reduction of paper consumption, contributing to the preservation of the environment;
- 5) Continuous improvement through the use of the methodology;
- 6) Improving the institutional climate;
- 7) Creation of an area laser.

Plans for Improvements and Maintenance

Improvement Plan :the study was carried out in order to reduce costs of photocopying and use of digital file through the imaging system, as well as cost reduction and process improvement in the entire organizational climate.

CONCLUSION

This study aimed to apply a methodology capable of reducing the cost to the Revenue Recovery process. By analyzing the results described in the previous chapter, one can observe that the use of some tools of Analysis Methodology and Solutions collaborated on the suggestions of improvement proposals in the process under study, such as to significantly reduce amount and cost of photocopying and the physical space used by the file. By analyzing the results, we can also observe that consequently there will be improvements that will focus on the routine work of analysts and organizational climate.

EMPIRICAL STUDY ON THE DEVELOPMENT OF CHINESE EXECUTIVES INTO A SOURCE OF SUSTAINABLE COMPETITIVE ADVANTAGE

Lingfang Fayol-Song, ESCEM School of Business and Management, France

ABSTRACT

Over the last two decades, more and more Chinese nationals have been employed by multinational companies (MNCs) operating in China to take the positions previously occupied by foreign expatriates from investor countries. The development of local managers has therefore become crucial in the field of human resource management because the success of these companies depends greatly upon the ability and competence of its executive management class. By referring to the criteria set up by the resource-based view (RBV), the present research reveals that currently Chinese executives working in MNCs have not yet really become a source of sustainable competitive advantage. The internationalization of Chinese executives of high potential is proposed as a solution to improve their existing skills and develop new ones as well.

KEYWORDS: Chinese executives, Competitive advantages, Internationalization, Resource-based views, Turnover

INTRODUCTION

Foreign direct investment in China has increased noticeably since the 1990s as a result of the country's integration into the world economy and the increase in domestic purchasing power. Despite the current global financial crisis, China has never lost its attractiveness for foreign direct investment (FDI). In fact according to the survey on investment for the period 2010 to 2012 (2010-2012 World Investment Prospects Survey) presented in 2010 at the World Investment Forum organized by UNCTAD (United Conference on Trade and Development), China remains the most popular worldwide destination for FDI (Zhou, 2010).

The continual inflow of FDI has brought about an increase in the number of multinational companies which have set up in China. In these companies, over the last two decades more and more local Chinese executives have been employed to replace foreign expatriates from the investor countries. The development of local managers has therefore become crucial in the field of human resource management because the success of these companies depends greatly upon the ability and competence of its executive management class.

LITERATURE REVIEW

According to Barney (1991), Dierickx and Cool (1989), Amit and Shoemaker (1993) not all resources are inherently able to create a sustainable competitive advantage. Only certain types of resource are able to produce significant returns. These tend to be resources which are valuable, rare, imperfectly imitable, non-substitutable, non-tradable, long-term, non-transferable and capable of being appropriated.

METHODOLOGY

By referring to the resource-based view, we have carried out an empirical study amongst 10 French companies operating in China. The main objective was to investigate the current status of Chinese local executives measured against criteria for competitive advantage developed by Barney (1991), Amit and

Shoemaker (1993), Dierickx and Cool (1989). Based on the results of the investigation, some suggestions for improvement are put forward. In order to achieve the detailed and in-depth knowledge we sought, we used the qualitative method using the technique of semi-directive interviews. Each individual interview was on average 1 hour long.

EMPIRICAL RESULTS AND DISCUSSION

Our research reveals that currently in the majority of cases, local executives have not yet really achieved sustainable competitive advantages:

- The potential for value added that local executives are able to bring to a business has not been fully exploited. In the majority of cases, the management positions held by local executives have tended to be more operational than strategic or for control, and their exposure has been limited to local markets. The PriceWaterHouseCoopers survey (2004) shows that most localized positions are accounting, human resources, sales and production. Lau's investigation confirms that management localization tends to be concentrated in the fields of human resources and sales (Lau, 2005).
- The knowledge and networks local executives possess are not specific to a particular company, but transferable to other companies. Up until now, most multinationals have tended to employ local executives primarily for their intimate knowledge of local markets and their network of professional and personal contacts. This is the type of knowledge which is fully utilizable by competitors (Tan, & Mahoney, 2006). When an executive moves from one company to another, he/she will bring this same knowledge to a new employer.
- Local executives are a rare but tradable resource. In the employment market in China, the imbalance between supply and demand means that foreign and national companies are competing for local executives in the same small pool of managerial talent. Consequently, the turnover rate of management staff is extremely high. Local executives frequently change companies in order to secure faster promotion and higher salaries. In some small companies, the turnover can be as high as 30 percent. However, large companies are not immune from the phenomenon. The company L'Oreal which employs 3000 in China has a turnover rate amongst its marketing staff of 15 per cent (Jakouiller, 2006). In such a situation, local competence and knowledge are commodities which can be bought if a company is ready to offer more attractive contracts to target managers.

Our empirical research also reveals that most of the companies investigated are well aware of this predicament. They are keen to find ways of improving local competencies and skills so that local Chinese can become a sustainable competitive resource which is valuable, non-transferable, non-tradable, and inimitable. To reach this objective, the internationalization of local executives is proposed as a solution which will not only improve existing skills but also develop new ones.

The term 'internationalization' refers to the involvement of Chinese nationals across the whole spectrum of company activities. Two concrete measures are proposed: firstly, instead of sending local executives on short courses at company headquarters for training and visits, individuals showing particular potential should be given posts of responsibility at company headquarters and be based there for a relatively long period of time. During their stay, they should be encouraged to participate in the decision-making process in a variety of different contexts. Secondly, for nationals who have been with the company for several years in China, instead of confining them to work in the local market, they should be offered a variety of posts in a variety of overseas locations outside China.

Internationalization initiatives can enlarge the vision of local executives, and allow them to become fully familiar with company culture, norms, different services and staff members. They can also establish networks at headquarters and in other company locations. This process will foster greater allegiance to the company. Local executives will now in turn be more suitable candidates for higher and strategic managerial positions. Moreover, the new knowledge and skills acquired are truly specific to the particular company involved. Consequently, this valuable resource will become even scarcer, much more difficult to imitate, or transfer to other companies.

CONCLUSION

Despite the real interest shown in internationalization, our study reveals that very few companies have actually put concrete measures in place to facilitate the process in a systematic and organized way. Managerial and administrative obstacles still exist which effectively prevent internationalization: e.g. short-term business vision within the companies themselves, fear that investment made will be lost given the high turnover of staff at this level in China and complexity of administrative procedure involved in joint ventures.

IS IT ETHICAL TO USE WOMEN AS A MARKETING INSTRUMENT?

Ahmet Bayraktar, Rutgers University

ABSTRACT

There have been growing concerns about and critics toward the usage of women as a sexual object in marketing practices. However, firms are still using women as an instrument to attract consumers. This paper examines some business ethics theories to determine whether firms' use of women as a marketing instrument is ethical or not. The deductions from the business ethics theories suggest that it is unethical to abuse women in marketing practices. The analysis in the present paper shows that all the theories that were examined support this conclusion

KEYWORDS: Business ethics, marketing, advertising, women abuse, sexuality

INTRODUCTION

In today's business world, women are used as an object to attract consumers' attention to the products that firms sell. They are exploited as a marketing instrument in a wide range of firms' activities. Women appear as a sexual object in any kind of advertisement or as an attractive material standing nearby a product. Sometimes firms use sexual saleswomen to facilitate the sale or to attract consumers' attention to the firm or product. Particularly, it is very common to use sexually attractive women in advertisements regardless of the product is related to sexuality. The use of sexual women images in advertisements is so widespread that such images are found in the advertisements for most product types from clothing to motor cars, from cosmetics to furniture.

It has been argued that the use of women as a sexual object has a great number of negative effects on individuals and societies (Lanis and Covell, 1995; Brown, 2002; Zillmann, 2000; Stern and Handel, 2001; Wilson and Moore, 1979; Allen, et al, 1995; Emmers, et al, 1995; Kaplan, 1966). It may negatively affect individual's socialization process (Kaplan, 1966), attitude and behavior (Stern and Handel, 2001; Brown, 2002; Zillmann, 2000), health (Brown, 2002) and physical and spiritual development (Lanis and Covell, 1995; Brown, 2002; Kaplan, 1966). It may also badly influence socio-cultural values and families (Smith et al., 1995; Lanis and Covell, 1995; Kaplan, 1966).

There have been growing concerns about and critics toward the usage of women as a sexual instrument in marketing practices. Parents are complaining about the common use of sexuality and trying to prevent their children from being exposed to it (A State of Industry Report on Sex on TV); women associations are declaring their concerns by arguing that this kind of applications devalue women's place in a society (Richmond and Hartman, 1982; Onyejekwe, 2005); religious institutions are expressing their discomfort with the applications (Kaplan, 1966); and social science researchers are exclaiming the potential problems that these applications may cause. However, despite all of these oppositions, firms are continuing to use women as a sexual object in their marketing practices.

The goal of this study is to determine whether firms' use of women as a marketing instrument is ethical or not. Business ethics is a form of professional ethics that analyzes ethical principles and moral problems that arise in business environment. Therefore, business ethics literature must tell us something about the firms' controversial application mentioned above. This study aims at evaluating the abuse of women in marketing practices in the lights of business ethics theories. For this purpose, I firstly offer a brief review of literature on the abuse of women and sexuality in marketing. Secondly, I put forth the reasons why

firms' exploiting women is problematic. Thirdly, I examine some business ethics theories to determine what they tell us about firms' use of women as a marketing instrument. Finally, I discuss the contributions and implications.

LITERATURE REVIEW

The Abuse of Women and Sexuality In Marketing

Women are used as a marketing instrument by firms in a wide range of marketing practices. They are used as a material mostly in advertisements. Baker's study (2005) shows that an average person in the US is exposed to over 3,000 ads each day. In many advertisements, the ideal woman is an object that exists to satisfy men's sexual desires. Many researchers have shown that women in advertisements are portrayed as sex objects (Baker, 2005). Advertisers feature provocative images of sexually attractive women in ads (Reichert, 2002).

Sexual appeals in advertisements consist of a variety of elements models. Courtney and Whipple (1983) describes sexuality in advertisements as sexuality in the form of nudity, sexual imagery, innuendo, and double entendre used as an ad object for different kinds of products. An analysis reveals that common forms of sexuality in ads include the following: nudity (dress), physical attractiveness, seductive behavior and interaction, innuendo, and other factors such as setting, context and camera effects (Reichert, 2002). Lambiase and Reichert (2003) propose that there are five types of sexual content in ads: Nudity, sexual behavior, physical attractiveness, sexual referents, and sexual embeds. Ramirez and Reichert (2000) propose that viewers consider physical characteristics the most sexual in ads and the sub-categories of these characteristics are clothing, attractiveness and body.

The Problems with Female Exploitation in Marketing Practices

The problems with the abuse of women in marketing practices arise at both the individual and the societal level. It is very difficult to determine all the possible problems and threats. I summarize some of these problems and show that why the subject matter is important.

There are both empirical and theoretical bases for claiming a link between the usage of sexual images of women in advertisements and individuals' sexual attitudes and their general attitudes and beliefs (Lanis and Covell, 1995; Brown, 2002). Brown (2002) argues, where he talks about the Cultivation Theory, that exposure to sexuality has been found to increase older adolescents' acceptance of non-marital sexual behavior. Zillmann (2000) claims that prolonged exposure to erotica causes exaggerated estimates of the prevalence of more unusual and unethical kinds of sexual behavior, less expectation of sexual exclusivity with partners, and concern about that sexual inactivity leads to a health risk. Furthermore, he argues that this kind of exposure can diminish individual's concern about sexual child abuse and increase sexual callousness. He also suggests that pornographic photographs contribute to adolescents committing sex crime. Another research (Stern and Handel, 2001) claims that viewing sexual scenes may cause girls and boys to have sexual relations. All of these negative effects can lead adolescents to consider that the institution of marriage is sexually confining, and that having a family and raising children are an unattractive prospect (Zillmann, 2000). Research claims that a connection exists between viewing sexually oriented stimuli and aggression (Wilson and Moore, 1979). Researchers (Zillmann, 2000; Allen, et al, 1995; Emmers, et al, 1995; Lanis and Covell, 1995) claim that being exposed to sexually attractive stimuli increases males' sexual aggression towards females. Zillmann (2000) also claims that viewing sexually oriented stimuli or frequent exposure to sexuality increases the inclination to commit rape. In addition, Brown (2002) argues that exposure to sexuality increases interpersonal violence.

Individuals and parents are increasingly worried about the common use of sexuality. According to a State of Industry Report on Sex on TV (2003), a great number of surveys showed that not only were parents increasingly concerned about their children's exposure to sexual content, but also adults were uneasy with the common use of sexuality. In the same report, a 2001 Family Circle survey showed that 93% of respondents turned off the television or changed channels due to sexual content, and a 2001 Kaiser Family Foundation survey demonstrated that 80% of parents were worried about their children's overexposure to sex and violence, and that 63% of parents mentioned that they were concerned about sexual content.

Many studies have shown that women abuse in marketing practices negatively affects social values and women's role in society. Although the actual position of many women in society has improved significantly, the images of women in ads have not changed appreciably, and women are still being used as a marketing instrument in a way that degrades women's value (Baker, 2005; Richmond and Hartman, 1982). Richmond and Hartman (1982) claim that the advertisements including females' sexual images are exploiting women's body, degrading the feminine role, and insulting societal etiquette. Kaplan (1966) proposes that if individuals' sexual drive is misused and abused, it may lead to a debased personality and a degraded society. Studies also argue that sexuality is the cause of gender inequality (Baker, 2005). Feminists and woman associations decry and complain about firms' exploitation of women (Richmond and Hartman, 1982). Lanis and Covell (1995) argue that women have strong negative attitude toward the sexual portrayals of women in advertisements. Another critic is that women make comparisons between the sexual images in the form of attractive models and themselves, with the result that advertisements including such images create negative effects and lower women's satisfaction with their own appearance (Gould, 1994).

The above considerations explicitly show that firms' usage of women as a marketing instrument is problematic. However, many firms consider no problem with this strategy and regard it as an ethical practice. Therefore, it is significant to evaluate the issue in the light of business ethics theories and determine whether it is ethical or not.

Deductions from the Approaches to Business Ethics Regarding the Issue

In this section, I examine Utilitarian, Kantian, Contractarian, and Aristotelian Approaches to business ethics in order to determine what they tell us about firms' usage of women as a marketing instrument and whether it is ethical or not. After investigating them one by one, I examine them together analyzing a sample case.

Utilitarianism

Utilitarianism –coined by Bentham- is a type of consequential theory. A consequentialist theory of ethical reasoning focuses on the results of human actions, and all human actions are assessed in terms of the desirability of their consequences (Donaldson and Werhane, 1999). In Utilitarianism, actions are evaluated in terms of the extent they contribute to greatest overall happiness (Donaldson and Werhane, 1999; Audi, 2007). Most utilitarianists hold the view that ethically right acts are those that produce the greatest good or happiness for the greatest number (Donaldson and Werhane, 1999; Audi, 2007; Burns and Hart, 2005). A particular behavior is regarded as ethical if it produces the greatest balance of good over bad when compared to all alternative behaviors or if it maximizes the aggregate utility for the population that will be affected by the alternatives under considerations (Audi, 2007; LaTour and Henthorne, 1994). The idea summarizing the utilitarians' view is that the greatest happiness for the greatest number is the measure of right and wrong and that one should produce good or utility as much as he or she can.

Considering utilitarians' main view about business ethics and the problems with firms' female abuse, we can argue that firms' use of women as a marketing instrument is an unethical action. As discussed above, findings show that firms' exploiting women leads to many problems at both the individual and the societal level, and thus, causes pain or brings unhappiness to a great number of people. It is clear that the pain or unhappiness that this strategy will bring to society is much greater than the pleasure or happiness it will bring to a few firms. In addition, there is an important point that should be mentioned here. Some studies (Dudley, 1999; Reichert et al., 2001) have proposed that the use of sexual women images in advertisements, which is one of the most common types of women exploitation in marketing practices, has certain positive impacts on consumer behavior. However, according to a good number of research (Steadman, 1969; Alexander and Judd, 1978; Baker, 1961; Smith et al., 1995; Reichert, 2002, Reichert and Alvaro, 2001; Lambiase and Reichert, 2003; LaTour and Henthorne, 1994), it is a wrong strategy that has negative effects on consumer behavior. Thus, the pleasure that this strategy will bring to firms will be lower than they expect. Furthermore, utilitarians propose that a human's considerable unhappiness might outweigh the minor pleasures or happiness of many others (Donaldson and Werhane, 1999). The findings mentioned above clearly show that the problems resulting from firms' abuse of women outweigh firms' minor pleasure that may stem from their exploiting women.

Utilitarians argue that in evaluating happiness or pleasure, one must take into account not only present, but also next generations (Donaldson and Werhane, 1999). Considering the negative effects of women exploitation on both present and next generations, we can claim that the pleasure a few firms will have by exploiting women is too insignificant to take into consideration.

Utilitarians also consider the long-term consequences of actions for single individuals (Donaldson and Werhane, 1999). Considering the negative outcomes of women abuse, especially those on children, which may last for a long time and which may be very serious, again we can propose that the pleasure that will stem from the usage of women as a marketing instrument is too insignificant to take into account.

In conclusion, the deductions from Utilitarian Approach to business ethics suggest that firms' use of women as a marketing instrument is an unethical behavior.

Kantian Approach

Deontological theories argue that the measure that judges the rightness or wrongness of an action is the action itself, not the conclusion of the behavior (LaTour and Henthorne, 1994). One of the two approaches to deontological ethical reasoning that have profoundly influenced ethics is Kantian Approach. According to Kant, the only thing that can be good or ethical is an action of the will freely motivated for the right reason (Stanford Encyclopedia of Philosophy, 2004). He argues that other goods such as wealth, beauty and intelligence can be bad when they are used for only selfish ends (Donaldson and Werhane, 1999). A purely good and free act of the will is one done merely because you have the right reason for doing it. For Kant, the moral lies in the act itself and not in either one's happiness or the consequences brought by the act (Donaldson and Werhane, 1999). Therefore, acts will be good if they are done for the sake of what is right.

Kant calls the highest principle that can govern all humanity the "categorical imperative." Categorical imperatives are principles that are intrinsically valid and that must be obeyed in all situations and circumstances if our behavior is to observe the moral principle (Kant, 1989). He formulates the categorical imperative in different ways. The first one is "*One ought only to act such that the principle of one's act could become a universal law of human action in a world which one would hope to live*" (Donaldson and Werhane, 1999: 7). Bowie (1998) argues that Kant's first formulation of the categorical imperative elicits a theory of moral permissibility for market interactions. He further argues that

interactions that comply with the universalizability formulation are permissible so long as they do not violate any other moral principles. That is, if market interactions violate the universalizability formulation of categorical imperative, they will be morally impermissible. Kant's another formulation of the categorical imperative is "*One ought to treat others as having intrinsic value in themselves, and not merely as means to achieve one's ends*" (Donaldson and Werhane, 1999: 8). Bowie (1998) claims that this formulation provides the basis for a more robust theory of moral obligation in personal market interactions. He also claims that all individuals in a market transaction must be treated with respect.

Considering Kant's general approach, we can argue that firms' use of women as a marketing instrument is an unethical behavior. Since firms use women as an object for only selfish ends and they do not have the right reason for doing that, according to Kant's Approach, it is clearly unethical. Here, there is no need to take into account the negative consequences. It is enough to decide whether firms have the right reason for doing that.

If we are to apply Kant's first formulation to the issue in question, we need to construct the principle "It is morally permissible to abuse women in marketing practices" and then, ask whether such a principle can become a universal law for everyone. The answer is "no" because this principle is self-defeating, that is, it is likely to cause problems or difficulties instead of producing useful results. Bowie (1998) claims that self-defeating actions are morally wrong and cannot be consistently universalized.

It is clear that many firms treat women in their marketing practices merely as a means to achieve their goals, which are to attract attention to themselves or their products and to facilitate the sale. Kant's second formulation suggests that it is unethical to treat others as a means to achieve one's ends (Donaldson and Werhane, 1999). It also requires that firms should treat others with respect (Bowie, 1998). Bowie (1998) argues that human beings should be respected because they have dignity. However, many firms treat women disrespectfully by using them as a sexual means and thus, violate the ethical principles from Kant's standpoint. They also diminish women's dignity in the society (Baker, 2005; Richmond and Hartman, 1982).

In conclusion, the deductions from Kantian Approach to business ethics suggest that firms' use of women as a marketing instrument is an unethical action that firms should avoid practicing.

Contractarian Approach

A different type of deontology is suggested by many philosophers who focus more on the principles that govern society at large instead of on the actions of individuals. The philosophers try to establish universal principles of a just society through what might be called "social contract thought experiments" (Donaldson and Werhane, 1999). Three elements are important in most social contract theories: "consent of the individuals, agreement among moral agents, and a device or method by which an agreement (actual or hypothetical) is obtained" (Dunfee, et al., 1999). Contractarian approach utilizes the concept of hypothetical consent to justify principles, policies and structures (Dunfee and Donaldson, 1995). John Locke argues that a citizen's obligation to obey the laws or rules can be grounded only in that citizen's consent to the authority of the laws or rules (Dunfee et al., 1999). The philosophers ask us to imagine a situation in which there are no laws, no conventions, and no political state, and to consider rational people come together to formulate principles in order to govern social communities in that state. Those are presumably principles which every rational people would agree on and which would be universal (Donaldson and Werhane, 1999).

At this point, I would like to raise a critical question. Would every rational human being agree on the principle "Firms can use women as a sexual object in their marketing practices" or "Firms have the right to exploit women, if it brings money?" The answer is obviously "no." As mentioned above, findings show that a great deal of people or groups in society such as parents, women associations, and religious

institutions declare their discomfort with firms' exploiting women for their selfish purposes (Lanis and Covell, 1995; Richmond and Hartman, 1982; A State of Industry Report on Sex on TV, 2003). Thus, most of the people would oppose to that principle. Therefore, firms' abuse of women is an unethical practice in a just society.

John Locke argues that every individual is born with "natural rights," which are inalienable and which cannot be taken away (Donaldson and Werhane, 1999). Firms that use sexually attractive women in most of their marketing practices, especially in advertisements, negatively affect some individuals' rights by exposing them to sexual images that they do not want to see (Bayraktar, 2010). In other words, these firms suppress human rights by disturbing them with sexual images. Individuals often unwillingly see these images in advertisements or in mass media although they do not want to look at them (Bayraktar, 2010). Therefore, firms which use sexuality in their marketing practices take away some individuals' right to live at will. As contractarians argue, no one has the right to take away that of others.

According to the social contract that Donaldson constructed for business, corporations can survive only through the cooperation and commitment of society. This requires an implied agreement between firms and society (Dunfee, et al., 1999). Donaldson (1982) also suggests that organizations must avoid any practice that systematically worsens the condition of a group in a society. It is clear that contractarians pay much attention to the concept "consent of individuals" (Dunfee, et al., 1999; Dunfee and Donaldson, 1995). Therefore, a thought on which most of the population do not agree and which they fiercely oppose to cannot become a principle or a law. Thus, exploiting women to gain money, which systematically worsens the situation of a wide range of society, cannot become a principle and is clearly unethical in a just society.

In the ethical evaluations of business, contractarians would ask the following questions (Donaldson and Werhane, 1999):

1. Are the rules fair to everyone or do citizens consent to the rules?
2. Are the rules universal and do they stay that way even with the passage of time?
3. Is everyone in the society treated with equal respect?

Adapting the questions to the subject matter, we will get the answer "no" for each question. It is obvious that firms' exploiting women is not fair to everyone, but fair to a small group in a society. Therefore, the notion "Firms can exploit women," cannot become a universal principle. In that situation, everyone is not treated with equal respect; in contrast, firms diminish women's value in society (Baker, 2005; Richmond and Hartman, 1982).

Aristotelian Approach

Since Aristotelian Approach to business ethics appears to lack clear-cut-rules and principles to use in moral decision making or in deciding whether or not an action is good (Donaldson and Werhane, 1999; Stanford Encyclopedia of Philosophy, 2007), it seems difficult to get clear deductions from this approach regarding the moral aspects of firms' use of women as a marketing instrument. However, this approach provides us some indirect cues regarding the issue.

According to Aristotle, the criterion for judging whether an action is ethical or not is whether or not the action is compatible with one's inherent human capacities (Donaldson and Werhane, 1999). Actions that improve human capacities are good or ethical and those that deter human capacities from developing are

bad unless they are the best among negative alternatives (Donaldson and Werhane, 1999; Solomon, 1992). According to Aristotle, who is best known for his emphasis on the “cultivation of the virtuous” (Solomon, 1992), all free human beings are born with the potential to become virtuous and practically wise, but they must go through two stages in order to achieve the following goals. They must develop proper habits during their childhood and acquire the practical wisdom when their reason is fully developed (Stanford Encyclopedia of Philosophy, 2007). These help one become a good member of the community (Donaldson and Werhane, 1999).

As mentioned above, being exposed to sexual stimulus has serious negative effects on children. It causes them to develop improper or bad sexual habits or inclinations (Stern and Handel, 2001; Brown, 2002; Zillmann, 2000), negatively affecting their health (Brown, 2002). Thus, it negatively affects their both mental and physical development. Therefore, it may deter human capacities from developing and inhibit individuals from becoming virtuous and practically wisdom. These negative outcomes suggest that firms’ exploiting women, according to Aristotelian Approach, is a bad or unethical action.

Aristotle proposes that one has to think of oneself as a member of a larger community, and bring out what is best in us and in our shared enterprise (Solomon, 1992). He argues that people are inherently social and cannot be understood without considering the larger community in which they participate (Donaldson and Werhane, 1999). He also claims that virtuous are defined by the larger community, and therefore, there is no conflict between individual self-interest and the greater public good. In addition, he proposes that business ethics should emphasize on recognizing the rights of others instead of having rights oneself (Solomon, 1992).

Considering above arguments, we can conclude that according to Aristotelian approach women abuse in marketing is an immoral practice. As mentioned above, there is a conflict between firms’ abuse of women and social values. In addition, firms that use sexual women in their marketing practices do not take many individuals’ right into account. These practices may also inhibit children from becoming virtuous and practically wisdom, negatively affecting their both mental and physical development.

The Evaluation of the Theories by Analyzing a Sample Case

In this section, I evaluate firms’ usage of women as a sexual object in their marketing practices by analyzing a sample case, considering all the approaches to business ethics mentioned above. Let us suppose that a firm advertises its product on a billboard, using a partially nude and sexually attractive female model in a suggestive position in the advertisement. The billboard is right across a high school that has hundreds of students. Students view this advertisement a couple of times every day. In the lights of previous findings, this advertisement may lead students to develop wrong sexual behaviors or beliefs (Lanis and Covell, 1995). It may also increase male students’ sexual aggression (Zillmann, 2000; Allen, et al, 1995; Emmers, et al, 1995; Lanis and Covell, 1995) towards female students. In addition, it may lead students to commit sex or rape or at least increase their inclination to do that. Besides, parents of the students would be likely troubled (A State of Industry Report on Sex on TV, 2003) by the advertisement. Furthermore, this ad may degrade women’s value and the feminine role in the society (Baker, 2005; Richmond and Hartman, 1982). Some consumers may find the ad more engaging, interesting, and involving than a non-sexual ad (Reichert and Alvaro, 2001; Reichert, et al., 2001). In addition, the sexuality in the ad may create more positive feelings about the implementation of the ad than does any other ad that does not include sexual images (Heckler et al., 2001). The advertisement may also attract individuals’ attention (Dudley, 1999; Reichert et al., 2001). On the other hand, the sexuality in the ad may negatively affect individuals’ brand recall (Smith et al., 1995; Reichert, 2002, Reichert and Alvaro, 2001), and lead individuals to develop negative attitude toward the brand (Lambiase and Reichert, 2003; La Tour and Henthorne, 1994).

In order to evaluate whether this advertising practice is ethical or not, we need to answer the following questions derived from business ethics theories mentioned above:

- Does the proposed action cause any major damage to people or organizations (Dunfee, et al., 1999)?
- Are the possible consequences of the proposed action desirable?
- Does the proposed action produce the greatest good for the greatest number among alternative actions?
- Does the action maximize aggregate utility for the population?
- Does the firm take next generations into account?
- Does the possible individuals' unhappiness that results from the action outweigh the firm's happiness or pleasure?
- Does the firm take into account the long-term consequences of the action?
- Does the firm have the right reason to use the sexual image of a woman in the advertisement?
- Does the firm use the sexual image for only selfish ends?
- Is the action self-defeating?
- Does the firm treat other rational beings with respect?
- Does the firm treat women as a means?
- Is there any contradiction between the action and widely accepted moral obligations and principles?
- Is the intent of the action harmful (Dunfee, et al., 1999)?
- Does the action violate the law (Dunfee, et al., 1999)?
- Does the action leave another individual or group less well-off (Dunfee, et al., 1999)?
- Does the population that is influenced by the action consent to the firm's practice?
- Is there any agreement among social agents?
- Does the action violate individuals' rights?
- Does the action systematically worsen the condition of a group in a society?
- Is the action compatible with one's inherent human capacities?
- Does the action improve human capacities or deter them from developing?
- Does the action inhibit individuals from becoming virtuous and practically wisdom?

If an answer to above questions contradicts what business ethics theories teach us about an ethical action, it will indicate that the marketer's decision is problematic and probably unethical. Considering all the arguments above, we may argue that most of the answers support the conclusion that the advertisement in question is an unethical marketing practice.

CONCLUSIONS AND IMPLICATIONS

This paper aimed at determining if it was ethical to use women as a marketing instrument. It sought to answer the research question by examining some business ethics theories. The deductions from the business ethics theories suggest that the exploitation of women in marketing is an unethical practice. All the business ethics theories that were examined support this conclusion.

The main view of utilitarianism is that the greatest happiness for the greatest number is the measure of right and wrong and that one should produce good or utility as much as he or she can. That is, an action is ethical or right if it produces the greatest good or happiness for the greatest number among alternatives. A good number of studies argue that the exploitation of women by firms leads to many problems at both individual and societal level, and thus, causes pain or brings unhappiness to a great number of people. Therefore, according to utilitarianism it is immoral to abuse women in marketing.

The idea that summarizes Kantian approach is that a purely good and free act of the will is one done merely because you have the right reason for doing it and that interactions which comply with the universalizability formulation are permissible so long as they do not violate any other moral principles. It also argues that all individuals in market should be treated with respect. Considering the previous research findings, we may argue that firms treating women as a sexual object violate many others' right and they do not have the right reason to do it. In this situation, all individuals in the market are not treated with respect. Consequently, Kantian approach suggests that it is unethical to abuse women in marketing. Contractarian approach focuses on the consent of individuals and the agreement among moral agents. In addition, it claims that everyone in the society must be treated with equal respect. It also emphasizes on the inalienability of natural rights. Studies have shown that there is a conflict between firms' application in question and social values and that many people complain about the common use of sexuality. Furthermore, firms suppress some individuals' right by exposing them to sexuality. Therefore, we may conclude that according to contractarian approach it is immoral to exploit women in marketing practices. Aristotelian approach argues that actions that improve human capacities are ethical and those that deter human capacities from developing are bad unless they are the best among negative alternatives. It also emphasizes on recognizing the rights of others instead of having rights oneself. Since many studies have shown that being exposed to sexuality may prevent children from becoming virtuous and practically wisdom, we may argue that according to Aristotelian approach firms' exploitation of women is an unethical action.

This paper suggests that firms, particularly marketers and advertisers, should consider the ethical aspects of the abuse of women in marketing practices. They should take into account the possible negative consequences and avoid violating ethical principles. Specifically, they should avoid using women as a marketing instrument and treating them as an object taken advantage of its body and attractiveness.

SPAM BETWEEN LAW AND REALITY

Taoufik Bouraoui, ESC Rennes School of Business

ABSTRACT

Spams, extolling the merits of some types of products or services, encumber mailboxes. Appeared in various forms, spams avail each time a new look to escape the progress of mail filters. Sometimes having the form of textual messages, picture, PDF, Excel, MP3 and recently with the form of spams video of high quality, spammers employs all stratagems to diffuse their advertising messages. To fight against this plague, spams are illegal in France. The purpose of the law is to reconcile between the prospecting and the respect of the consumers, on the one hand, and to define a border between sending e-mails of prospecting and sending spams, on the other hand. However, illegality does not prevent their issuers from pursuing their activities. The development of this advertising medium is mainly due to the expertise and the professionalism of spammers who, in order to reach a maximum public, use sophisticated techniques allowing to enrich their address books, on the one hand, and regularly create new forms of spams to bypass the filters anti-spam and optimize as a result the rate of delivery of their messages, on the other hand. After the failure of the actual dispositions against the spam, numerous working hypotheses remain opened in which the question of the authentication of the spammer constitutes a way of struggle to be explored.

TEAM SELLING PLANNING

Samuel Kohn, New York Institute of Technology

Peter Harris, New York Institute of Technology

ABSTRACT

The paper presents an analytic approach, market tested at AT&T, to planning “team selling and sales management” resources, or “team sales” resources, within the “normative marketing plan” required for migrating industrial customers from old technology to new technology. The “normative marketing plan” for a new technology includes the marketing action plan, the integrated marketing communication and the team sales plan for managing the migration of customers to a new technology. Even though a successful implementation of the “teams sales” approach is critical to the overall success of the “normative marketing” and that there is literature on marketing action and integrated marketing communication components of the “normative marketing plan”, there is a literature gap provide for analytic approach to “team sales” planning. This paper addresses this void. The paper presents a quantification of the “team sales” effort and the “normative marketing plan” in terms of resources required, corresponding costs integrated with the “teams sales” efforts. The approach is applicable to preliminary and commitment stages planning. In addition, results provide a basis for tracking the “normative marketing plan” as it is being implemented and facilitates and permits management to make tactical and strategic adaptations as the plan is activated in the market. The focus is on “team sales” resources as integrated within the “normative marketing plan. Included in the approach are personnel, materials and cost as related to the team selling process. Team selling focus is on target customers for the purpose of making proposals and ultimately selling the new technology and their effectiveness as tied to marketing action plan and the integrated marketing communication effort.

COMPREHENSIVE MODEL FOR BUSINESS TRAINING BASED ON B- LEARNING

Fernando Orue-Carrasco, Universidad Popular Autónoma del Estado de Puebla (UPAEP)

Claudia Malcón-Cervera, Universidad Popular Autónoma del Estado de Puebla (UPAEP)

Jose Luis Martinez-Flores, Universidad Popular Autónoma del Estado de Puebla (UPAEP)

ABSTRACT

Training and development for staff are the best option available for companies to survive in a highly competitive global business environment, but for those companies that operate business units located in different cities or countries, it has a high cost for the great dispersion of staff. B-learning is presented as a viable and interesting option that achieves superior results in the learning process while significantly reducing the costs associated with training. In the state of the art, b-learning has been addressed with greater emphasis in academics and the few articles that focused on addressing business training, present partial solutions to the problems exposed. This paper proposes a model that offers a comprehensive solution for managing corporate training based on b-learning, and consists of three phases: design, development and implementation.

KEY WORDS: training, competitiveness, companies with geographically dispersed operations, *b-learning*.

INTRODUCTION

Today, the competitiveness of organizations is supported by the talent, competencies and abilities of its human resources. Training and development for staff are the best option available for companies to survive in a highly competitive global business environment. Training events, however, have several areas of opportunity cost: the cost of training itself and the associated costs (staff opportunity outside the company, downtime of productive assets and travel.) (Mahesh and Woll, 2005) Companies operating on a regional, national and even global panorama often have not trained their staff in a standardized way, the above due in great measure to the high cost that the training process represents for the high dispersion of staff in different business units.

B-learning emerges as an option to meet the primary objective of improving the performance of the human factor in business, significantly reducing travel costs, staff time outside the company and all costs associated with a face to face training, which achieves superior results in the learning process by taking the best of classroom learning and the interactivity of e-learning (Mahesh and Woll, 2005). The real value of b-learning lies in its potential to create learning experiences that provide the right knowledge at the time and place for each individual need, at the same time it allows the trainee to connect through global boundaries, cultures and time zones to go beyond good basic training to a more systematic education that promotes continuous learning. (Teng et al., 2009)

LITERATURE REVIEW

In the state of the art, b-learning has been addressed with greater emphasis on academics and especially in institutions of higher education, offering evidence of the high level of development, applications and benefits offered by e-learning and especially b-learning. In the literature reviewed research papers that focus on the issue of corporate training, however only one of them is specific in proposing solutions to the problems presented in this study (Mahesh and Woll, 2005); other papers propose solutions or models in academia (Osguthorpe and Graham 2003; Verkroost et al., 2008, Malcón-Cervera et al., 2008) and more general solutions or models in the business field (Liening et al. 2007; Isaila 2009). None of the reviewed articles

presents an integral model for business training. The model proposed by Mahesh and Woll (2005) with application to business training has limitations and is not transportable in its entirety to the general problems of training in companies because:

- ✓ The company where was developed and applied it corresponds to very high-tech manufacturing.
- ✓ The model offers a very specific technical and maintenance process in semiconductor manufacturing.

Selected models offer partial solutions regarding the problem of corporate training. They are: 1. the elements can be combined, 2. the theme to see on-campus, online and field activities, 3. the dimensions to be considered and the best combination for the strategic design of a module, 4. a conceptual model for the successful implementation of academic courses using critical success factors and 5. the stages in development b-learning system. For the development of the strategic functions of the model, several works were consulted: Brown (2002) on training needs assessment of Inciarte (2009) in planning and design of instruction, Valiathan (2010) in developing the elements of instruction online, Mahesh and Woll (2005) in development of classroom instruction and field activities, Malcón-Cervera (2008) in choosing the platform and assembly of course, Barnum (2002) adaptation and induction of instructors and employees; also Kirkpatrick (1996) for the evaluation process.

PROPOSED CONCEPTUAL MODEL

Based on the above, highlights the importance and necessity of developing a competencies model by offering a comprehensive solution for managing corporate training based on b-learning. The proposed model is outlined in Figure 1:

Figure 1 Proposed Model

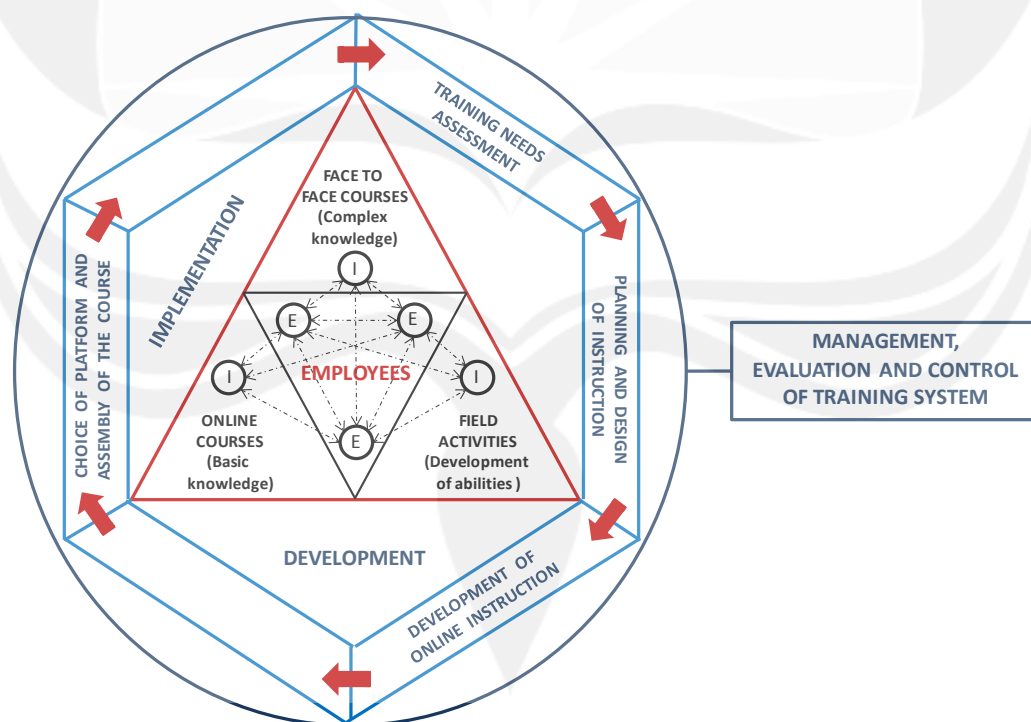

Figure 1 shows the model solution in b-learning environment for business management training. Source: Authors.

The proposed model takes several ideas of the authors selected and offers a comprehensive solution to the problem of training that have the companies operating medium and large business units located in different

cities or countries, it presents in the perimeter's section the 6 strategic functions in sequence, corresponding to the phases of design, development and implementation. An explanation of the 6 strategic functions:

Training needs assessment: This is a process that performs the data collection to identify and determine what training needs exist so that training can be developed to really help the organization to achieve its objectives, identify those needs critical to success of a training program.

There are 4 main reasons why an analysis and needs assessment should be performed before the training program is developed:

- a. To identify specific problem areas in the company.
- b. To get support from management.
- c. To develop database for effective program evaluation.
- d. To determine the costs and benefits of training.

For the needs assessment process, four areas are identified that could indicate training needs or competencies development for employees:

- a. Development of skills to fill a current need.
- b. Organizational problems of attitude or relationship among employees.
- c. Satisfy needs and new knowledge due to operational changes (technological, legal, regulations, etc.).
- d. Development of career plans of the company.

A careful analysis should identify training needs at three levels: organizational, job function and the employee's position. (Brown, 2002)

Planning and design of instruction: Planned dates, locations, instructors and group(s) of employees, considering the needs identified in the above process, is also designed instruction, which consists in developing the preliminary design of the proposed training, which comprises: a). General purpose, b). Range, c). Audience and prerequisites, d). Content structure / Agenda, e). Teaching and learning activities that cover all content and course objectives, f). Educational materials and their characteristics that will be developed, g). Support materials, these last 2 points should cover face to face part, online and field activities (Inciarte, 2009).

Development of online instruction: In this function, the schedules are actually raised in the design phase, define and develop the establishment of the issue (basic), its content and structure, determine the use of instructional materials to facilitate and support learning. A key activity at this stage, is the definition and development of interactive communication between participants and instructor, also incorporates the visual design of educational materials to better support and facilitate learning, also determining the appropriate interactions that are creative, innovative and involve employees to explore further, such as demonstrations, simulations, laboratories, self-assessments, tests and evaluation forms, support materials (videos, audio and video), specific training methods, methods of interaction (both, Synchronous chat and conferencing, and asynchronous, discussion forums, email). (Valiathan, 2010)

Development of face to face instruction and field activities: In this function, are defined and developed the establishment of the issue (complex knowledge), its content and structure, and method of assessment tests, presentations, instructor-led activities (tables of analysis, debates, and exhibitions), independent class activities (literature research, research reports and case studies documented), field practices for the development of skills (operation of equipment, assembly and disassembly of devices, use of tooling, devices, metrology and calibration equipment, etc.). (Mahesh and Woll, 2005)

Choice of platform and assembly of the course: Once the course is designed and developed, the technology platform is chosen, which is the basis to implement the virtual part of *b-learning* environment. It must satisfy the course design and have the ability to support the development of elements of online instruction,

classroom instruction and field activities. Then proceed to purchase and subsequently assemble the course. (Malcón-Cervera, 2008)

Adaptation and induction of instructors and employees: To ensure the best result of the training in this environment it is necessary, both instructors and employees are motivated and adapted in b-learning, as with the technology available, the use of the technology platform, the application of the elements of online instruction, the strengths and weaknesses of classroom instruction (online and field), as well as the scope and limitations of each modality, so it requires a preliminary induction workshop in a b-learning environment in which instructors and employees demonstrate their competence to teach and be trained respectively, in this mode (Barnum, 2002).

In the central section of the model, there are the employees receiving training in 3 modes: classroom, online and field activities, with dotted lines showing two-way interactivity between employees and instructors which includes submission of abstracts and supplementary information and interactivity between employees which reinforces the knowledge gained. The possibility of post-interactive courses, online and field activities, give the b-learning environment enormous possibilities of strengthening due to multiple communication options that offer, synchronous and asynchronous. To ensure the proper administration of the 6 strategic functions and the 3 phases of the corporate training model, b-learning environment is considered a key activity of evaluation and monitoring, in which surveys and evaluation forms are designed asking for feedback, results and observations, and adjustments are made in the redesigned and developing training courses and feedback is provided to the instructor, all with the goal of continuously improving training in b-learning environment.

The methodology for evaluating the training program on b-learning environment is that of Kirkpatrick (1996), which uses a variety of levels of assessment and general guidelines to ensure that the course is applicable and relevant to the objective group. It is a model widely used in the evaluation of training programs to be useful, simple, and practical in its application, and is based on 4 levels of measurement: 1. Reaction (how the participants employees feel regarding various aspects of the event), 2. Learning (knowledge of the objectives of the event), 3. Performance (vision of the transfer of learning from the classroom, virtual or physical, to the work environment) and 4. Results (specific results and goals that occur in the company resulting from the training).

CONCLUSIONS

Implementing a training program on b-learning environment in a company operating at regional, national or global level, is an important decision that will improve performance and standard of living of staff, significantly reducing staff time out of workplace / city and downtime of productive assets and the cost of training to minimize travel expenses, purchase of support materials, hiring of instructors and rental facilities. The companies may have staff trained in all kinds of concepts and techniques in a standardized and low cost, despite the high dispersal of staff in different business units, also the new staff will have a rapid induction and integration into the company. The importance of the proposed model is to provide a comprehensive solution to the problem of corporate training. The methodology and the model could be transported to large companies in various orders; the same shall be validated in a training process in a business environment.

A ROAD TO FINANCIAL STABILITY

Irfan Munawar Gill, Securities & Exchange Commission of Pakistan

Uzma Ashraf, University of Hong Kong & Federal Board of Revenue, Government of Pakistan

Douglas Arner, University of Hong Kong

ABSTRACT

This article draws a road map to financial stability. It has been done through digging into the successive episodes of the crisis that broke out during and the corresponding regulatory-cum-supervisory attempts that have been made to ensure a bulwark against any future threat to systemic failure. This article highlights the efforts of world supervisory authorities through Basle Committee in creating an effective regulatory framework for financial markets and explores the weaknesses inherent in the regulations that were in force from time to time, to anticipate and emit an accordingly effective response to help contain the crisis

BACKGROUND

The international financial markets witnessed unprecedented growth and expansion after World War II. With the establishment of cross border branches and subsidiaries of financial institutions, the international financial markets became more interconnected and dependent on each other. The financial markets continued to flourish rapidly till late sixties however it came to a halt with the collapse of Brettonwoods system of managed exchanged rates in 1973 (Kuwer LAW, 2001). The financial markets got exposed to new uncertainties arising out of hybrid transactions and new capital and interest rate risks which emanated from the collapse of managed fixed exchange rate regime. Excessive borrowing & lending fuelled by massive amounts of petrodollars coupled with interest rate hike in US led to the realization of systemic risk as a factor which may lead to systemic crisis. The situation was aggravated further with the collapse of a number of big financial institutions such as Franklin National Bank in US and Bankhaus Herstatt in Germany therefore, the Basel recommendations and Capital accords came as a response from the regulators of the world to cater for any such incidents in future.

However, the Basel capital accords and recommendations could not stop the outbreak of The Asian financial crisis in 1997-98 which in fact laid the foundations for the unprecedented 2007-09 global financial crisis. In response to Asian financial crisis, the regulatory bodies came up with amended capital accords by incorporating market risk into the risk management criteria and finally Basel II was offered as a solution to any foreseeable systemic crisis in 2006, for banks. At that time, the supervisory authorities were fully aware of the fact that the cross border exposures and inter dependency of financial institutions have given birth to a new banking model called, “universal banking” where, run on one bank in one part of the world could cause collapse of other financial institutions in the rest of the globe. We will see through this article that to what extent, the supervisory authorities through Basle capital accords have been successful in making financial markets more certain and secure and at the same time, we will identify the issues that hindered effectiveness of these controlling mechanisms thus leading to recurrence of financial crisis.

The regulation of financial markets is a continuing task; as financial markets expand, new and innovative products continue to develop therefore, it is always difficult rather impossible to apply “one size fits all” formula in regulation and supervision of international financial markets and banks. The history of financial crisis is as old as the market itself (Kindleberger, 1989) which depicts the lack of coordination between host and home country supervisors, the tendency of supervisory authorities to be more reactionary rather than proactive in their approaches and less effective enforcement mechanism as the

major factors that aggravated the crises in the financial markets. The Basle Committee was constituted to fill in these gaps by G10 Governors for setting standard for international financial markets. They established a standing committee, renamed later as Basle Committee on Banking Supervision (BCBS) for the purpose (G10 Governors, the Communiqué, September 1974).

The Basle Committee (BCBS) started its journey with the issuance of its recommendations commonly called, First Concordat in 1975 (Basel Committee, 1975). The first concordat was important in the sense that it was first time in the history of international financial regulation that the principle of joint responsibility between home and host supervisors was established for the supervision of foreign banking establishments. It was stated that the supervision of liquidity shall be the responsibility of host supervisors and the supervision of solvency of foreign branches shall be the responsibility of home supervisors and an emphasis was placed on information sharing and cooperation between home and host authorities. Following the collapse of Banco Ambrosiano in 1982 and keeping in view the problems identified in regulation of holding companies and mixed activity groups, the Basle issued the revised concordat in 1983 (Basel Committee, 1983) wherein in addition to earlier principles, it was stated that the authorities should adopt the principle of consolidated supervision and the health of financial institutions should be judged on both stand-alone and consolidated basis (Basel Committee, 1978). The revised concordat further made an important recommendation that the home and host authorities should monitor the effectiveness of supervision conducted by other and should step in to extend supervision or to take necessary action if the supervision is not properly done by the other. The 1983 revised concordat was subsequently examined by the Basle Committee to issue an information supplement (Basel Committee, 1990). The Basle Committee recommendations though had no legal status yet these were successful in creating agreement on application of minimum standards in the supervision of international financial markets.

The 1988 was an important year in the regulation and supervision of international financial markets. The Basle Committee was successful in creating an agreement among supervisory authorities on the application of minimum capital rules commonly called 1st Capital Accord or Basle I (Basel Committee, 1988). The Basle I fixed a minimum capital ratio of 8% to the total risk adjusted assets and provided a tiered definition of the capital and divided the assets of the bank in different risk buckets on the basis of underlying risks involved. The factors behind its universal acceptance and application were its relative simplicity and minimum costs however subsequently, it was subject to increased criticism as the focus of these rules was only counterparty default or credit risk and the market and operational risk have not been given any weightage in calculation of minimum capital ratios of any bank. Another point that worked to its disadvantage was its failure to create a level playing field for all international financial institutions through its classification system as it assigned a zero percent risk figure to the OECD Governments and central bank credits and 100 percent for all other claims irrespective of the credit standing of counter party concerned (Walker, 1999).

However the Basle Committee did not put full stop here and continued its efforts to fill in the gaps in the regulation and supervision of financial markets and made significant achievements in the form of establishment of minimum standards in 1992 (Basel Committee, 1992) and the core principles for effective banking supervision in 1997 (Basle Committee, 1997). Though the market charge was also included in Basle I through Market Risk Amendment in 1996 (Basel Committee, 1996) however due to its crude classification system and failure to adjust with subsequent changes in the structure and operation of financial markets, the single measurement mechanism became outdated and need was felt to overhaul the whole system. Therefore the Basle Committee started working to devise a more risk sensitive and adaptable to change mechanism. After extensive consultations, a new capital framework commonly called Basle II was introduced in 2001 (Basel Committee, 2001). The purpose of this framework was to improve the safety and soundness of financial system through three pillar structure; (i) capital adequacy, (ii) supervisory review, and (iii) market discipline through necessary disclosures (Basel Committee, 2001).

This new system is more risk sensitive as more risk buckets are included in the calculation of minimum capital requirements and new operational risk charge has been introduced to cater the losses caused due to failure of internal control systems, processes and staff corruptions. This effort to strengthen internal controls and systems has been complemented by new supervisory review mechanism and market disclosures therefore the system has been made flexible, innovative and adaptable to changing banking structures, operations and products.

However this new framework could not save the world from new crisis because the Basle Committee had limited participation with no formal status. The structure was weak in the sense that it remained ineffective in devising binding international standards in the regulations of financial markets and banks while on the other front, it worked remarkably well in developing consensus on application of minimum standards in the supervision of financial markets. Though the standards were formulated but harmonious and across the board enforcement could not be realized. This gap in implementation and discretion in adoption resulted to the outbreak of present crisis and as they call it “breaking the buck”, it triggered a run on banks and “run-like situations” (where bank withdrawals are made from core funding area of the financial system. Thus the Basel II, that was supposed to be a bulwark, could not halt the tumultuous financial fabric that was under threat from not only systemic risk factors but was suffering under pressures of financial instability and economic shocks.

The run on banks are always serious and requires immediate and effective control measures because they have the potential to spread like a contagion and could lead to systemic risks as the events following Lehman Brothers witnessed. A timely support might have avoided the loss of confidence that spread out due to the attitude of authorities (that Lehman would not be sporadic for systemic crisis, so let it be allowed to fail). There we saw, not only Basel II failure but a complete loss of faith on all the existing regulatory or supervisory bodies including G-7 ‘s comprehensive statement (Oct 2008) as endorsed by full membership of IMF and world Bank and then Financial Stability Forum (FSF) report (April 2008) focusing 5 major regulatory areas and 7 issues followed by G-20’s Declaration to support an open global economy by laying the foundations for reforms in Action Plan to ensure such crisis never to happen again (November 2008).

The year 2009 kept policy makers occupied in redesigning and modifying the financial supervisory-cum-regulatory structure that ensures transparency, accountability and across the board adoption and enforcement. There the Group of Governors and heads of supervision issues Basel III in September 2010 which enhances the minimum capital (common equity) requirements from 2% to 4.5%, along with a conservation buffer of 2.5% for the banks. These capital enhancements are supplemented by a non-risk based leverage ratio for the banks. These are the additional measures proposed and are being finalized for adoption to stop further erosion of the global financial architecture. To quote Mr. Nout Wellink, Chairman of the BCBS, “the combination of much stronger definition of capital, higher minimum capital requirements and the introduction of new capital buffers will ensure that the banks are better able to withstand periods of economic and financial stress, therefore supporting economic growth”.

FSB and BCBS provide supervisory forum for regular cooperation to design out acceptable and enforceable universal risk-based management mechanism. Unless and until a comprehensive regulatory structure prescribing market discipline, an effective corporate governance code, and an effective mechanism to protect financial institutions in the event of any failure is not materialized and adopted by all the influential market players, *the road to financial stability* would continue to provide a bumpy ride during the years to come. Thus establishing a financial code for all the major actors would ensure progress and smoother running of highly advanced and complex financial markets of today.

AN ANALYSIS OF THE RELATIONSHIP BETWEEN STORE IMAGE, SATISFACTION AND LOYALTY BEHAVIORS EXHIBITED BY OLDER SHOPPERS: THE CASE OF ENGLAND'S GROCERY MARKET

Robert J Angell, University of Plymouth, UK

Juliet Memery, University of Plymouth, UK

Phil Megicks, University of Plymouth, UK

Troy Hefferman, University of Plymouth, UK

ABSTRACT

In many of the World's developed countries, the proportion of people aged 60 years and above is growing. Research has shown that this age group is larger, healthier and more willing to spend than preceding generations (e.g. Drolet et al, 2010). Hence, it is fundamentally important that organizations adopt strategies which better reflect and satisfy the needs of this segment. This paper presents an empirical model of satisfaction with application to the grocery retail sector. The proposed model builds upon recent developments in the literature by integrating a contextually specific newly developed scale for store image with well established measures of satisfaction (i.e. Fornell, 1992; Fornell et al, 1996) and loyalty components; future intentions, word-of-mouth and price tolerance (Fullerton, 2003; Soderlund, 2005). Using data collected from 524 postal surveys the model was assessed using structural equation modelling (SEM). The findings revealed six distinct components of store image, each influencing satisfaction to varying degrees. Of the three loyalty components, satisfaction was found to have the largest effect on positive word-of-mouth. The study provides an innovative and tailored framework for both researchers and grocery retailers to follow.

KEYWORDS: Older consumers, store image, satisfaction, loyalty.

INTRODUCTION

Change is a fundamental part of life. It can be linked to behavior from an individual to a universal level. The prospect of change may appear daunting and challenging to an organisation, but it also offers the opportunity to explore new areas, develop innovative ideas and discover emerging markets.

A natural source of change that has occurred in many developed countries in recent times is the increasing growth of the 60 years+ demographic. In the United Kingdom (UK) this segment is currently growing twice as fast as the population as a whole (Office of National Statistics, 2005). It is expected to continue growing for at least twenty more years due to the post-war and 1960s 'baby boom' generations, decreased fertility and increased longevity (Angell *et al*, 2009). Researchers are aware that population change on this scale will affect social models, as an ageing population has implications for wider marketplace activity (Dodge, 1958). In the UK little research has focussed on this age group and there remains a prevalent perception that organizations lack the know-how and understanding to market products and services to this segment effectively (Carrigan and Szmigin, 1999). This has stimulated a number of calls for more research to be conducted (e.g. Ahmad, 2002; Meneely et al, 2009; Thompson and Thompson, 2009).

An important measure in contemporary marketing theory shown to influence organizational success is customer satisfaction (Fornell, 1992; Fornell, 1996; Anderson et al, 2004). Research has shown that the careful management of the satisfaction process can result in positive outcomes for organizations; for

example improved return on investment, increased customer retention, word-of-mouth and resistance to price rises (Fornell, 1992; Anderson et al, 2004; Fornell, 2007). For this to be a reality, CEO's and marketing managers require an understanding of how this process is operationalized (e.g. Johnson et al, 2001). As such, this paper presents an empirical model of satisfaction, applying it in both the context of older shoppers and grocery retail. It is suggested that retailers adopting this model will be in a stronger position to tailor more exacting strategies for satisfying their older customer base.

MODEL DEVELOPMENT

The term *satisfaction* originates from the Latin words *satis* and *facere*, meaning “enough” and “to do”. These together make *satiatio*, which loosely translates as “enough to excess” (Fornell, 2007). As an academic concept, satisfaction has been conceptualised and empirically tested in a variety of subject disciplines; for example life satisfaction (e.g. Neugarten, 1996), job satisfaction (e.g. Locke, 1976) and consumer satisfaction (e.g. Oliver, 1980). Through time, the research literature has fragmented between the broad categories of “transactional” and “cumulative” satisfaction. Transactional satisfaction refers to single-example evaluations based on a solitary experience with a product, service or organization. In contrast, cumulative satisfaction is a multi-usage evaluation based on an unlimited number of consumer experiences. It thus represents an overall assessment. This is often considered more relevant in fast moving consumer goods (FMCG) sectors such as grocery retail (Fornell, 2007). Cumulative satisfaction is therefore the basis of the model used in the current study.

Antecedents of Customer Satisfaction

Several measures have been tested as antecedents of satisfaction (e.g. Cronin et al, 2000). One of the foremost models for measuring cumulative satisfaction has been the American Customer Satisfaction Index (ACSI) pioneered by Fornell et al (1996). Fornell and colleagues suggested that satisfaction was the product of customer expectations and perceptions of quality. Despite the relative success of the ACSI, Johnson et al (2001) have called for models of satisfaction to continue evolving.

A recent advancement in the extant literature has been the embedding of store image perceptions within the satisfaction process (Gail and Scott, 1995; Bloemer and De Ruyter, 1998; Theodoridis and Chatzipanagiotou, 2009). Store image is a well-established concept in the marketing literature with seminal articles by Kunkel and Berry (1968), Lindquist (1974) and Zimmer and Golden (1988). Oxenfeldt (1974) defined store image to be an accumulation of attributes considered as salient when evaluating a store. In a contemporary article, Theodoridis and Chatzipanagiotou (2009) showed that store image factors had a positive influence on judgements of customer satisfaction. The authors implemented a store image scale finding that personnel, pricing, products and in-store convenience were all significant drivers of satisfaction in a grocery retail context. Nonetheless, to date no previous research has provided a holistic overview of store image for older shoppers. Therefore, the development of a new scale was required:

H1a,...H1n = Store image factor n, n+1... will have a significant positive influence on satisfaction.

Consequences of Satisfaction

In the past, a number of consequences relating to satisfaction have been proposed (Fornell, 2007). Possibly the foremost of these has been the loyalty construct which has been used in various satisfaction process models (e.g. Fornell, 1992; Fornell et al, 1996; Johnson et al, 2001). Loyalty has been referred to as a “deeply held commitment to re-buy or repatronize a preferred product/service” (Oliver, 1999, p34). Similarly, Bolton et al (2000) simplified it as “repurchase intentions” or “repurchase behavior”. Nonetheless, the application of repurchase intentions/behavior, or any other variable as a solitary measure of loyalty is erroneous. As such, certain researchers have argued that *loyalty* must include, but be more

than, repurchasing and retention (Chandon et al, 2005). An approach gaining more conceptual support is that *loyalty* is a continuum (Bloemer and de Ruyter, 1998), existing at different levels (Reichheld, 1996; Oliver, 1999; Griffin, 2002). Griffin (2002) has proposed that completely loyal customers will firstly make regular repeat purchases, secondly make word-of-mouth recommendations to others and, finally, show tolerance towards price changes. This conceptualisation of *loyalty* was adopted in a study by Zeithaml et al (1996), which used five measures. Similarly, authors such as Cronin et al (2000) and Andreassen and Lindestad (1998) have applied these under the guise of one wider construct of loyalty (or behavioral intentions). Although it has yet to be widely applied in the literature, researchers such as Soderlund (2006) have called for this “cocktail” approach to be dismissed. Empirically Soderlund showed that loyalty outcomes are more accurately explained when they are independently assessed. This is, in part, because a person’s propensity to undertake one of the three behaviors (e.g. future intentions to purchase) does not necessarily imply a similar application of another (e.g. word-of-mouth).

A future intention refers to the likelihood (or willingness) of a customer to continue using an organization (Griffin, 2002). The relationship between this variable and satisfaction has been widely studied. For example, Anderson and Sullivan (1993) found that satisfied customers are more easily retained. In addition, Caparo et al (2003) suggested that the more satisfied the customer becomes, the less he or she is likely to consider alternatives. It follows that:

H2 = Satisfaction will have a significant positive influence on Future Intentions.

Word-of-mouth marketing refers to the passing of information from person to person, specifically in the form of recommendations and endorsements. In an article in the Harvard Business Review, Reichheld (2003) advocated that loyalty should be measured using a single item, i.e. “intention to recommend”. Although counter arguments have suggested that he overlooked the importance of 1) repurchase intentions and 2) resistance to counter-offers (see Keiningham et al, 2007), the article illustrated its potential. This line of thought has contributed to the idea of ‘Customer Voluntary Performance’, which relates to a marketing philosophy where customers are ambassadors for the organization (Bettencourt, 1997). In his study Anderson (1998) found that more satisfied customers were increasingly likely to engage in positive word-of-mouth. He also measured how dissatisfied customers behaved. Not surprisingly, satisfied and dissatisfied customers both vocalised strongly. Therefore, it is suggested that:

H3 = Satisfaction will have a significant positive influence on word-of-mouth.

Price tolerance refers to the extent to which customers would be willing (or not) to accept a rise in prices (Griffin, 2002). In a study by Anderson (1996), using data collected from the Swedish CSB, the author found that price inelasticity (i.e. price tolerance) increased with satisfaction. The author noted that tolerance differed between markets exhibiting varying degrees of competition. As such, industries that are more competitive recorded lower price tolerance levels, presumably owing to greater customer choice. In an experimental study, Homburg et al (2005) found a similar relationship with satisfaction. They did observe, however, that this is only *linear* to a certain point whereby higher levels of satisfaction have no further influence on willingness to pay more:

H4 = Satisfaction will have a significant positive influence on Price Tolerance.

METHODOLOGY

A two-stage research design was employed to test the model. This followed the sequential transformative procedure offered by Cresswell (2002), integrating both qualitative and quantitative methods. This type of “mixed method” research has been shown as useful in studies where both exploration and confirmation of phenomena is required. Since the development of a new store image scale for older grocery shoppers was

needed, a scale development procedure was followed in line with the advice of authorities such as Hinkin (1995) and DeVellis (2003). As such, an initial stage of qualitative interviewing was used to generate a pool of items for refinement and validation (Hinkin, 1995).

Figure 1: Proposed Satisfaction Model

Qualitative Interviews

To generate the “pool” of store image items, semi-structured qualitative interviews with 36 older grocery shoppers were conducted during January 2009. Interviewees were required to be over 60 years of age and responsible for doing the grocery shopping in their household (Meneely et al, 2009). People were recruited based on their membership to social organizations specifically for older people. In total, six organizations participated in the study with a chairperson or secretary acting, in the first instance, as an intermediary between the researcher and respondents. The convenience sample generated an eclectic demographic of older people, ranging in sex, age, mobility and geographical location (Hare, 2003; Meneely et al, 2009; Thompson and Thompson, 2009).

Overall, a total of 38 store image items were found to be recurrently important to older shoppers. As an assessment of reliability, a second analyst reviewed the transcripts to test whether any major discrepancies were observable in the coding of themes (Silverman, 2006). In addition, a team of experts reviewed the pool of items to verify that content validity was evident (Hinkin, 1995; DeVellis, 2003).

Quantitative Survey

Following the qualitative research, a questionnaire survey was implemented. This used performance-based questions for the 38 store image items and scales borrowed from Fornell (1992) for satisfaction and Fullerton (2003) for future intentions, word-of-mouth and price tolerance. The items were assessed using a 7-point likert scale. For the loyalty scales Fullerton’s original item wording was modified to better represent the grocery retail context being studied (see Appendix A). A range of demographic and behavioral questions was also included.

Respondents were asked to base their answers on the grocery store in which they had spent the most money in the six months prior to data collection. The sample was derived randomly from a list of people aged 60 years and above residing in England who had agreed to be contacted for research purposes. The questionnaires were distributed as a postal survey. A modified version of Dillman’s (1978) total design method was implemented consisting of an initial questionnaire, postcard reminder and second questionnaire. A small bookmark gift was included as an incentive to encourage higher response rates.

FINDINGS

Overall a total of 524 usable surveys were returned representing a response rate of 26.2%. A selection of the demographic and behavioral characteristics is given in Table 1.

Table 1: Selected Demographic and Behavioral Characteristics of Respondents

Demographic	Respondent Composition
Sex	Male (37.4%); Female (62.6%)
Age	60-64 (26.5%); 65-74 (38.5%); 75+ (34.9%)
Geographical Location	East (11.6%); East Midlands (8.9%); London (10.9%); North East (5.3%); North West (13.7%); South East (16.8%); South West (11.8%); West Midlands (10.9%); Yorkshire (10.2%)
Household Car Ownership	Car (74.4%); No Car (25.6%)
Grocery Store Choice	Supermarket (95%); Convenience Store (5%)

Scale Purification, Modification and Validation

The store image items were subjected to exploratory factor analysis (EFA) using principal axis factoring and orthogonal rotation (Kline, 1994). Between the orthogonal methods available to researchers, varimax rotation has properties especially suited to the development of scales (Kline, 1994; DeVellis, 2003).

Of the 38 store image attributes assessed, several items loaded below the conventionally accepted level (i.e. <.40), cross-loaded on more than one factor (i.e. >.40), or loaded independently of any other items (Tabachnick and Fidell, 2007). As such, the five offending items were removed from the analysis, resulting in a clear six-factor solution. This composition of factors accounted for 61.9% of the variance in the observed items. Table 2 presents the results of this test. Factor 1 relates strongly to aspects of store environment, factor 2 to store personnel, factor 3 to merchandise, factor 4 to other clientele, factor 5 to services provided by the store and factor 6 to prices and promotions (see Table 2).

To validate each of the scales, the six-factor solution was integrated into a measurement model alongside the borrowed scales for satisfaction, future intentions, word-of-mouth and price tolerance (DeVellis, 2003). Confirmatory factor analysis (CFA) was used to test the measurement model. This is a well-practiced procedure in the scale development and model testing literature (Anderson and Gerbing, 1988; Hinkin, 1995; DeVellis, 2003; Brown, 2006). To eliminate any possible issues with non-normal data, the robust maximum likelihood estimation procedure within the Mplus 5.21 software was used. When estimating a CFA model, Mplus provides an assessment of fit as well as Lagrange modification indices that identify areas in which changes could improve the quality of the model. In the first assessment, the model fitted the data at levels below commonly accepted thresholds ($\chi^2 = 19470$, $df = 990$; $p < .001$; CFI = .90; TLI = .89; RMSEA = .062). Whilst chi-square statistics have been widely considered as sensitive to sample size and less useful in applied research, Hu and Bentler's (1999) suggestion that CFI and TLI should be closer to .95 and RMSEA <.06 indicated that the model, in its current state, was not a good fit for the data. The modification indices suggested issues with five items in the store image scale. High modification indices should be assessed one item at a time and should not contradict substantive reasoning (Boomsma, 2000). In this analysis each of the five items was found to violate the condition of unidimensionality outlined by Anderson and Gerbing (1988), loading significantly on more than one factor. Following the advice of Anderson and Gerbing the items for *spacious layout*, *product information*, *employee helpfulness*, *non-grocery products* and *parking facilities* were all removed from the scale. A second CFA received significantly higher model fit scores ($\chi^2 = 17955$, $df = 695$, $p < .001$; CFI = .93; TLI = .92; RMSEA = .056).

Each of the constructs was assessed for construct validity in line with the advice afforded by Fornell and Larcker (1981). Convergent validity was attained since the average variance explained (AVE) by each factor exceeded 50%. Discriminant validity, which assesses whether constructs are sufficiently distinct from each other, was also achieved (see Fornell and Larcker, 1981). Scale reliability using Cronbach Alpha coefficient was in excess of the .70 threshold suggested by Nunnally (1978).

Table 2: Rotated Component Matrixes for the Six-Factor EFA Solution

	<i>Store Env</i>	<i>Personnel</i>	<i>Merchandise</i>	<i>Clientele</i>	<i>Services</i>	<i>Price/ Promotion</i>
Spacious layout	.714					
Aisle width	.676					
Store lighting	.647					
Easy-to-navigate	.643					
Pleasant smells	.611					
Reachable shelf height	.529					
Trolley & Basket quality	.517					
Pleasant sounds	.490					
Approachable employees		.835				
Polite employees		.819				
Friendly employees		.815				
Helpful employees		.785				
Knowledgeable employees		.676				
Product availability			.659			
Product variety			.658			
Product freshness			.629			
Product quality			.622			
Product sizes			.583			
Branded products			.573			
Product info			.500			
Helpful shoppers				.880		
Friendly shoppers				.858		
Likeminded shoppers				.796		
Returns policy					.632	
Complaints handling					.526	
Additional facilities					.506	
Non grocery products					.439	
Parking					.435	
Efficient checkouts					.426	
Price discounts						.849
Reduced to clear discount						.655
Multi-buy discount						.583
Competitive pricing						.435
Variance Extracted	13.08	12.98	11.50	8.71	7.98	7.66

This table provides the results of the modified exploratory factor analysis using principal axis factoring and varimax rotation. The six-factor solution is presented and the variance extracted in each is given.

Model Testing

To test the specified hypotheses, the proposed model was assessed using structural equation modelling. As a technique, structural equation modelling (SEM) extends the CFA procedure by including structural parameters between relevant factors (Schumacker and Lomax, 2004). The estimated model demonstrated

an acceptable level of model fit - $\chi^2 = 1842$, $df = 713$, $p < .001$; CFI = .93; TLI = .92; RMSEA = .05 (Hu and Bentler, 1999). The structural relationships between each of the store image factors, satisfaction and loyalty behaviors (future intentions, word-of-mouth, and price tolerance) are provided in Table 3.

Table 3: Evaluation of Structural Parameters in the Proposed Model

Independent Variables	Satisfaction	Future Intentions	Word-of-Mouth	Price Tolerance
Store Environment	.24***			
Personnel	.15***			
Merchandise	.35***			
Clientele	.05			
Services	.13**			
Prices & Promotions	.06			
Satisfaction		.55***	.74***	.51***
R ²	.69	.30	.54	.26

*This table presents the structural parameters of the hypothesized relationships in the structural model. ***Significant at the $p < .001$; **Significant at the $p < .05$ level*

The results revealed that the six store image factors explained 69% of the variance in customer satisfaction. Of these, store environment (.24), personnel (.15), merchandise (.35) and services (.13) all had a positive and significant influence on the dependent variable. As such, a 1-point increase in merchandise had a .35-point increase in satisfaction. Store environment had the second largest effect on satisfaction with personnel and services having a considerably smaller influence. Two of the store image factors, i.e. clientele and prices and promotions, were found to have a non-significant relationship with satisfaction. This infers that improvements in the performance of these two factors would not increase the satisfaction exhibited by older grocery shoppers.

Satisfaction was found to have a positive and significance in all three of the loyalty behaviors; future intentions (.55), word-of-mouth (.74) and price tolerance (.51). This suggests that increases in satisfaction would have the largest influence on positive word-of-mouth, followed by future repurchase intentions. Although price tolerance had the lowest standardized estimate, the strength of the relationship still indicates that older people are increasingly happy to pay more at stores in which their satisfaction is higher. The following section presents a discussion of these findings.

DISCUSSION

In the development of the tested model, a series of specific hypotheses were formulated. In the first instance, the model was organized to assess the relationship between store image factors and customer satisfaction. For this, a new scale of store image for older grocery shoppers was needed. In so doing a list of 38 attributes were identified through qualitative research. These items represented aspects in a grocery store considered most important by older people. Following purification and validation of the scale, 28 store image attributes were retained, represented by six underlying factors.

Following development of the scale, the six store image factors were tested as antecedents of satisfaction. As such, the findings indicated that H1 was only partially accepted. Of the four store image factors, store environment, personnel, merchandise and services were found to positively and significantly influence the satisfaction of older shoppers. Both clientele and prices and promotions were found to have a non-significant effect. This is surprising given that past research by Theodoridis and Chatzipanagiotou (2009) found that pricing policies relating to the economic aspects of the store had a strong positive influence on satisfaction. It should be noted, however, that their study was undertaken in Greece and draws upon potential cultural differences as well as those because of age. With the latter, this finding suggests that older grocery shoppers are no more satisfied with product discount and promotional improvements. A

potential explanation might be that older people are expert as seasoned purchasers of food and are in a strong position to gauge what price is fair for various products.

Merchandise was found to have a strong positive effect on customer satisfaction. Of the store image factors, aspects relating to products had the largest influence. This re-enforces the findings of Theodoridis and Chatzipanagiotou's (2009) store image study. Hare (2003) and Meneely et al (2009) also found products to be important in the grocery store decisions made by older people. In the Theodoridis and Chatzipanagiotou (2009) study, the authors found that store atmosphere was not a significant driver of satisfaction. This was not replicated in the current study, which found that older people considered the store environment to have the second largest influence on satisfaction. A possible explanation might be that assessment of the store environment encourages parallels to be drawn with perceptions of sanitation and hygiene (Petermans and Van Cleempoel, 2010).

Three loyalty behaviors were hypothesized as consequences of satisfaction in the structural model; namely future intentions, word-of-mouth and price tolerance. In the past, one or more of these constructs have tended to be 'wrapped up' as loyalty and measured as a direct consequence of satisfaction (see Fornell, 1992; Fornell et al, 1996; Johnson et al, 2001). The findings in this study support the hypotheses (H2, H3 & H4), but suggest that older people clearly make a distinction between the three as satisfaction has varying degrees of influence. As such, satisfaction had the largest effect on word-of-mouth, explaining 54% of its variance. This corroborates more general research (e.g. Anderson, 1998) in which a strong link has been identified between these variables. Possibly, the most interesting finding in this regard is that satisfaction has a greater influence on word-of-mouth than both future intentions and price tolerance. A possible explanation might be that older people are less sure of what the future holds in store for them. They might, therefore, be less able to make these types of decision based on satisfaction alone. Other influences such as mobility and financial constraints may therefore play a greater role. As such, whilst satisfaction is a strong predictor of word-of-mouth, it may not be sufficient to explain future repurchase intentions and price tolerance.

CONCLUSIONS

This study presents an empirically tested model of customer satisfaction for the relatively under researched older consumer segment (60+). As such, the model integrates both store image and loyalty behaviors; i.e. future intentions, word-of-mouth and price tolerance, into a full structural equation model. This presents a unique compilation of variables, building upon recent advancements linking store image with satisfaction (Gail and Scott, 1995; Bloemer and De Ruyter, 1998; Hackl et al, 2000; Theodoridis and Chatzipanagiotou, 2009) and satisfaction with the three components of loyalty (Soderlund, 2005). As such, the research answers the call of Johnson et al (2001) for satisfaction models to continue evolving.

One of the main contributions of this paper is the development and presentation of a new scale of store image for older grocery shoppers. This grants the model a more contextualised function with factors specific to the sample. Given that the model was developed using the advice provided by experts such as Hinkin (1995) and DeVellis (2003), with validity and reliability above accepted thresholds, the scale is suitable for adaptation and use in other research with older people. The model shows that this segment does not base their satisfaction judgements on store factors such as price and promotions and clientele. As such, the merchandise and store environment should be of more pressing attention for grocery retail managers. Investment in these areas will have the greatest influence on satisfaction.

With regard to the consequences of satisfaction, the study presents future intentions, word-of-mouth and price tolerance as separate outcomes. This moves away from the "cocktail" approach used in many previous studies (Soderlund, 2005). The results indicate that this strategy is justified since older people were shown to operationalize different levels of each variable because of changes in satisfaction. In

isolation, satisfaction was shown to have the largest effect on word-of-mouth. As such, future repurchase intentions and price tolerance were influenced to a lesser degree. This infers that treating these three variables as composites of loyalty is poorly conceived and that using independent measures provides a more accurate understanding of intended behaviors. The model also provides some important implications for grocery retailers. For instance, depending on the strategy being pursued by a store, managers might choose to invest in improving satisfaction. For example, a grocery retailer may wish to grow its customer base but does not have resources needed for advertising. In this situation, Reichheld (2003) would advise investing in word-of-mouth. This can be achieved by raising customer satisfaction. In other scenarios, the grocery retailer may wish to increase customer retention or price tolerance. In these instances, improving satisfaction might have a more restricted influence with outside factors potentially having a greater effect. Depending on the outcome retailers wish to pursue, careful consideration is needed to determine the extent that investment in satisfaction is beneficial.

Limitations and Future Research

Despite the theoretical and practical contributions of the study, there are some notable limitations providing scope for future research. In the first instance, the study utilised a convenience sampling procedure when recruiting participants for the qualitative interviews. Whilst steps were implemented to ensure a wide composition of demographic characteristics were evident in those recruited, it should be acknowledged that random samples are preferable, especially in the item generation stage of scale development. As such, future research will need to test the transferability of the scale in a range of contexts. It should also be noted that satisfaction explained only a limited amount of variance in the future intentions and price tolerance constructs (30% and 26% respectively). This was significantly lower than the same relationship with word-of-mouth (54%), suggesting that the use of additional explanatory variables might improve overall model fit.

APPENDIX

Appendix A: Scale Items

Variable	Scale Items
Store Environment (Store Image 1)	On a scale of very good to very poor how would you rate your store in the following: <i>Aisle Width; Store Lighting; Navigation Ease; Pleasant Smells; Reachable Shelf Height; Trolley & Basket Quality; Pleasant Sounds</i>
Personnel (Store Image 2)	On a scale of very good to very poor how would you rate your store in the following: <i>Knowledgeable staff; Friendly staff; Polite staff; Approachable staff</i>
Merchandise (Store Image 3)	On a scale of very good to very poor how would you rate your store in the following: <i>Available produce; Variety of produce; Freshness of produce; Size Assortment of produce; Branded Ranges; Product Quality</i>
Clientele (Store Image 4)	On a scale of very good to very poor how would you rate your store in the following: <i>Friendly Shoppers; Helpful Shoppers; Likeminded Shoppers</i>
Services (Store Image 5)	On a scale of very good to very poor how would you rate your store in the following: <i>Returns Policy; Complaints Handling; Additional Facilities; Checkout Efficiency</i>
Prices/Promotions (Store Image 6)	On a scale of very good to very poor how would you rate your store in the following: <i>Price discounts; Reduced-to-clear Items; Multi-buy Promotions; Competitive Pricing (q14a)</i>
Satisfaction	<i>a) Considering all your dealings to date with ABC, how satisfied are you with them overall? b) Considering all of your prior expectations of ABC, to what extent has fallen short of this? c) Consider your ideal ABC, how close does ABC match with your ideal?</i>
Future Intentions (Loyalty 1)	To what extent do you agree with the following statement (7-point scale): <i>a) Do less (more) business with ABC in the next year b) Wont take my business to a competitor of ABC c) (Wont) switch from ABC to another service provider</i>
Word-of-mouth (Loyalty 2)	To what extent do you agree with the following statement (7-point scale): <i>a) Say positive things about ABC to other people b) Recommend ABC to someone who seeks my advice c) Encourage friends and family to do business with ABC</i>
Price Tolerance (Loyalty 3)	To what extent do you agree with the following statement (7-point scale): <i>a) Continue to do business with ABC if its prices increase b) Pay a higher price than competitors charge for the benefits of using ABC c) Accept higher prices if ABC raises its prices</i>

PROBLEMS AND PROSPECT OF INDIAN THERMAL POWER SECTOR IN THE PERSPECTIVE OF DEPLETING COAL RESERVE

Sukanya Ghosh, Meghnad Saha Institute of Technology

Biman Maity, Meghnad Saha Institute of Technology

ABSTRACT

Increasing industrial growth all over the world including of India largely depends on availability of electricity. Apparently, the situation in power sector gives us an optimistic look. However, an insight in thermal power gives us a bleak picture as thermal power stations mostly depend upon coal as basic raw material where economists have projected that the country has little over 250 billion metric tonnes of coal reserve that can sustain continued and progressive demand for generation of thermal power in the next 40-50 years. Indian thermal stations have already started importing coal at an exorbitant price from other countries to maintain generation and supply. Besides, every thermal power station emits CO₂, Suspended Particulate Matter (SPM), fly ash and effluents that creates health hazards, also contribute to global warming. Keeping all these factors in mind, researchers have developed a model based on Auto Regressive Integrated Moving Average (ARIMA) to depict the future prospects of coal based thermal power sector of India. The model concludes that India needs to identify alternative sources of power generation other than coal to find out a path of development to grow without damaging world and maintaining sustainability.

INTRODUCTION

Since independence, India's population has grown from 300 million to more than a billion today. Increased population and changing lifestyle along with rapid economic growth has demanded accelerated energy requirement of the country. Ever since 1990s, India's Gross Domestic Product (GDP) has been increasing rapidly and it is estimated to increase in the same pace in next couple of decades. It is also estimated that the rise in GDP should be followed by an increase in the expenditure of key energy sector, namely electricity. Thermal power is the basis source of country's energy production. In the beginning of 2010 the country produces 1,57,229.48 MW of electricity out of which 1,00,598.40 MW was generated from thermal plant. Coal is the basic primary fuel in thermal power plants, although there are other natural resources like hydro-electricity, nuclear, solar and wind power which could be utilized.

These alternative sources of power are either highly technology oriented or capital intensive or demand highly skilled human capital. Moreover, commissioning a power plant based on these alternative sources of energy is time consuming. As an alternative to the critical demand for power, the Planners of the country have concentrated more on commissioning of thermal power plants. Coal happens to be the basic fuel of any thermal power plant and India had no worry regarding supply of this basic raw material till recently. Unfortunately, the stock of coal in India is not unlimited like any other countries in the world. The share of coal in electricity generation declined from 98% in 1950-51 to 62.3% in 2009-10. Even then, it accounts for more than one-half of the electricity generation of the country. Coal mining in India commenced way back in the 18th century when much of the stock was exported to UK mainly due to limited requirement of thermal power in industries and in domestic sector. This industry, in those days

was in the hands of private entrepreneurs. In 1923, the then Government of India, conceived regulatory framework and in 1972-73, the Indian government nationalized the coal industry. Coal India Ltd (CIL) was incorporated as a holding company for seven coal-producing subsidiaries. Today CIL is engaged in mining of coal from total of 495 working coal mines which account for nearly 88% of total coal production of the country. It is estimated that total coal reserve in India is 267 billion tons. At present, the Government of India has tentative plan to add more than 50 gigawatts of new coal-fired generating capacity during its 11th power plan. In the recent five year plan ending in March 2007, only about 12 gigawatts out of 20 gigawatts of new coal-fired generating capacity were planned and completed.

India happens to be third largest coal producing country. Unfortunately, Indian coal is of poor quality with high ash content and low caloric value i.e. gross heat of combustion. A major portion of this ash is inherent in the coal, aggravating the difficulty in removing it before combustion. High ash content of Indian coal and inefficient combustion technology contribute to emission of suspendable air particles and other trace gases which are responsible for greenhouse effect. Thus, the vicinity of a thermal power house is highly polluted causing health hazards and damage to agriculture. In consideration of depleting stock of quality coal, India has already started importing coal from countries like Indonesia, Australia and South Africa. However, import cost of such coal is high and continuity of import of coal from these countries may be uncertain, as there is likely to be worldwide shortage of availability of coal in near future. The remainder of the paper is organized as follows. Section 2 briefly discusses the relevant literature. Data selection, research methodology, and empirical models are described in Section 3. Section 4 provides analysis and interpretations of the empirical findings and Section 5 concludes the paper.

LITERATURE REVIEW

According to Dresner (2002), "Sustainability is a concept which combines post-modernist pessimism about the domination of nature with almost Enlightenment optimism about the possibility to reform human institutions." Since the conclusion of the Brundtland Commission (World Commission on Environment and Development, 1985), in itself something of a political compromise, the two competing notions of *strong* and *weak* sustainability have dominated the theoretical debate on sustainable development. Loosely speaking, *strong* sustainability argues that we must live within the environmental and ecological limits that the planet clearly has. *Weak* sustainability argues that humanity will replace the natural capital we have use, and that we depend on, with human-made capital. Theorists virtually unanimously agree that the latter has formed the conceptual basis for sustainable development.

The all-pervasive nature of neo-classical economics has also come to permeate throughout thinking on sustainable development, with a broad acceptance that intra-generational and inter-generational equity can only be achieved within the confines of economic growth. Brandon and Lombardi (2005) also focus on policy integration, as a central tenet for the evaluation of sustainable development. They claim that what is required is an integrating mechanism or framework to obviate the interconnectedness and interdependence of systems. In the existing literature of Econometric models and forecasts on coal consumption and production, a single equation time series model is frequently used choice.

In economic data commonly used in forecast are normally non-stationary and it has high value of correlation coefficient(R²) due to the presence of the trend between dependent and independent variable, not to a true relationship between them. In coal stock forecast model literature, Huntington (1994) shows that the forecasting performance of ten structural models was problematic since the errors in structural models were due to factors such as exogenous GNP assumptions, resource supply conditions outside OPEC, and demand adjustments to price changes. Lynch (2002) arrives to similar conclusions by comparing the theory and practice of oil supply forecasting. Koomey et al (2003) point out that factor like technological innovation and inaccuracy of coal reserve forecasts may also contribute to forecast errors. Pindyck (1999) points out that structural model may not be always accurate in long run forecast, but they are better to understand the short run fluctuation of dependent variable and other variables. Areepong

(1999) purposed of methods to forecast the nonrenewable product by using forecasting techniques of regression analysis, exponential smoothing method. The forecasting technique is used to be Regression Analysis or Moving Averages. For Moving Averages can work better with stationary data. For a time series that contains a trend or seasonal or non-stationary data, the forecasting technique that should be considered is Auto Regressive Integrated Moving (ARIMA). ARIMA models have been already applied to forecast commodity prices, such as oil ARIMA model has been used in different applications and has been demonstrated more flexible than other simple models. The purpose of ARIMA analysis is to find a model that accurately establish the past and future patterns of the time series data and it is able to capture then a wide variety of realistic phenomena regarding the uncertainty about the future risk.

DATA AND METHODOLOGY

The present research will focus on time varying trend on future projection of coal with the help of a bench-mark time series Auto Regressive Integrated Moving Average (ARIMA) model. Based on past twenty-six years secondary data on coal consumption and production of world as well as of India published by Energy Information Administration, International Energy Annual 2006, etc. we analyze the result by using ARIMA model to predict the future coal production and consumption in Indian economy as well as in World economy. After describing the ARIMA (p, d, q) where p is the order of the auto-regressive model, d is the number of differentiations to accomplish stationary; q is the order of moving average, we follow a parameter estimation procedure for the ARIMA model and an adaptive prediction scheme is then used to allow capturing the non-stationary characteristics. Based upon their work, the authors expect that electricity demand will continue to grow at high rates as a natural consequence of industrialization in India, which will require alternative sources of fuel other than coal in order to expand the country's power generation capacity and maintain sustainability.

EMPERICAL RESULTS

Future Projection of Coal Consumption and Production in World and India

Coal is a nonrenewable resource for thermal power production. It has depleted over time with an increasing rate and its demand also increasing over time with an increasing rate. Therefore, future projection of coal production and its demand become a necessary homework for decision maker to achieve a sustainable devolvement in respect of energy production. On the basis past 26 years(1980 to 2006)data collected from Energy Information Administration, International Energy Annual 2006 we are analyzing the future trend of coal demand and supply and find out a situation where coal production will saturated with its demand. We apply a general time series regression model which describes as:

$$Y_t = X_t\beta + \varepsilon_t$$

Where Y_t = production of coal, X_t = Year, ε_t = White noise, with zero mean and constant variance.

We estimate the time series regression equations for world coal consumption and production are as follows:

$$\text{World Coal Production: } Y_t = 4301.36 + 59.36X_t$$

$$\text{World Coal Consumption: } Y_t = 4280.63 + 60.94X_t$$

On the basis of the above time series regression equation we predict the future trend of production and consumption of coal and draw a diagram which gives us a saturation point where supply and demand intersect each other. After that point of saturation we will have a big question mark for coal supply and also the alternative sources of energy. This is a basic time series regression model where we do not consider the random walk model as well as the stationary property of time series that is the problem of

moving average and autoregressive problem. In order to avoid the problem of autoregressive and moving average we consider the ARIMA (autoregressive integrated moving average) model for prediction of consumption and production of coal.

AR-model: $y_t = \rho y_{t-1} + \varepsilon_t$.

It can be shown that $E(y_t) = 0$; $V(y_t) = \frac{\sigma^2}{(1-\rho^2)}$; $\text{corr}(y_t, y_{t-k}) = \rho^k$.

MA-models: $y_t = \varepsilon_t + \theta \varepsilon_{t-1}$.

It can be shown that

$$E(y_t) = 0; V(y_t) = \sigma^2(1 + \theta^2); \text{corr}(y_t, y_{t-1}) = \frac{\theta}{(1 + \theta^2)},$$

$$\text{corr}(y_t, y_{t-k}) = 0, k > 1.$$

ARIMA Model

$$y_t = \alpha x_t + \rho_1 y_{t-1} + \dots + \rho_p y_{t-p} + \varepsilon_t + \theta_1 \varepsilon_{t-1} + \dots + \theta_q \varepsilon_{t-q}.$$

Here x_t is the value of time period. ε_t Error term at time t. $\varepsilon_{t-1}, \dots, \varepsilon_{t-q}$ errors in previous time periods that are incorporated in the response y_t . We estimate the ARIMA model for production of coal and consumption of coal, where we apply Box-Jenkins methodology for ARIMA (p, d, q) models with time series data. In practical applications of B-J procedure, the most difficult part is the decision on the values of p, d, q. According to the Box-Jenkins method we determine whether the series is stationary or not by considering the graph of ACF. If a graph of ACF of the time series values either cuts off fairly quickly or dies down fairly quickly, then the time series values should be considered stationary. If the graph of ACF dies down extremely slowly, then the time series values should be considered non-stationary. If the series is not stationary, it can often be converted to a stationary series by differencing. In B-J procedure p and q can be determined by the ACF and PACF. From the characteristics of the ACF, it describes the correlation between the current states of the time series with the past. Using ACF, we can determine the moving average (MA) parameter's order q straight. From the characteristics of the PACF, it describes the correlation between the current states' innovation of the time series with the past. Using ACF, we can determine the auto-regressive (AR) parameter's order p directly. In such model, we use maximum likelihood method (MLE) to estimate the parameters. After estimate the model, we should checked for adequacy by considering the properties of the residuals whether the residuals from an ARIMA model must has the normal distribution and should be random. An overall check of model adequacy is provided by the Ljung-Box Q statistics. The test statistic Q is

$$Q = n(n+2) \sum_{k=1}^m \left(\frac{\hat{\rho}_k^2}{n-k} \right)$$

The model with the highest value of Q is preferred. The estimate ARIMA equations are as follows:

World Coal Production:

$$y_t = 4158.57 + 71.22x_t + 1.87y_{t-1} - 0.97y_{t-2} + 0.92\varepsilon_{t-1}$$

World Coal Consumption:

$$y_t = 4199.66 + 69.66x_t + 1.68y_{t-1} - 0.88y_{t-2} + 0.12\varepsilon_{t-1}$$

India Coal Production:

$$y_t = 103.45 + 13.94x_t + 0.87y_{t-1} + 0.13\varepsilon_{t-1}$$

India Coal Consumption:

$$y_t = 94.46 + 15.85x_t + 0.14y_{t-1} + 0.68y_{t-2} - 0.45\varepsilon_{t-1}$$

On the basis of Akaike Information criteria and Ljung –Box statistics, (where all t values for different regression parameter are statistically significant) we can accept the ARIMA model for different dependent variable such as: ARIMA (p=1, d=0, q=1) model: for World Coal Production, ARIMA (p=2, d=0, q=1) model: for World Coal Consumption, ARIMA (p=1, d=0, q=1) model: for India Coal Production, ARIMA (p=2, d=0, q=1) model: for India Coal Consumption. It can be used for predict the future trend on the basis of past data.

Figure 1: Partial Autocorrelation Function of the Differentiated Time Series of World Coal Production

The analysis of partial auto-correlation function (PACF) depicted in figure 1 demonstrate that the ARIMA model for World Coal Production to be evaluated by (p=1, d=0, q=1) as PACF exhibits a peak much different than zero.

Figure 2: Partial Autocorrelation Function of the Differentiated Time Series of World Coal Consumption

The analysis of partial auto-correlation function (PACF) depicted in figure 2 demonstrate that the ARIMA model for World Coal Consumption to be evaluated by (p=2, d=0, q=1) as PACF exhibits a peak much different than zero and exponential fall in negative values.

Figure 3: Partial Autocorrelation Function of the Differentiated Time Series of India Coal Production

The analysis of partial auto-correlation function (PACF) depicted in figure 3 demonstrate that the ARIMA model for Indian Coal Production to be evaluated by (p=1, d=0, q=1) as PACF exhibits a peak much different than zero.

Figure 4: Partial Autocorrelation Function of the Differentiated Time Series India Coal Consumption

The analysis of partial auto-correlation function (PACF) depicted in figure 4 demonstrate that the ARIMA model for Indian Coal Consumption to be evaluated by ($p=2$, $d=0$, $q=1$) as PACF exhibits a peak much different than zero and exponential fall in negative values.

Figure 5: Prediction of World Coal Production and Consumptions

Figure 5 shows the prediction results of World Coal Production and Consumption, and it is observed that after the 2050 we will reach a saturation pointing coal demand and supply in world.

Figure 6: Prediction of Indian Coal Production and Consumptions

Figure 6 shows the prediction results of India Coal Production and Consumption, and it is observed that after the 2055 we will reach a saturation pointing coal demand and supply in India.

Figure 7: Coal Consumption by Different Industries in India ('00000 tonnes)

Figure 7 shows the consumption of coal by different Indian industry and it is observed that the demand of coal as a raw materials for power sector increased over time where as the demand of coal as raw materials for others industry constant but at a high rate.

CONCLUSION

Indian economic growth has now stabilized at around 8 to 9 percent per annum, contributed largely by the industrial sector. We observe from Figure 7 that thermal power generating units use significant percentage of coal. Further, consumption of coal has increased, as other major industries are also dependant on coal. While consumption of coal in thermal power sector is increasing day by day, it is more or less stable in other industries. In this scenario if the trend of coal consumption in power sector continues to increase, other industries will starve for want of coal. The shortage of coal will push the raw material cost of other industries high and they will face the question of survival or growth. Therefore, in order to maintain the sustainable development and economic growth of the country, we need to reduce the use of coal by power sector. This also leads us to the conclusion that the country must look for alternative sources of power generation otherwise time will come when we will be in a situation where nothing will be left for us to produce and survive.

Further, as we are aware, in the context of Globalization of economy, no country has any boundary with the neighboring country. Every country is looking towards foreign market to achieve its target and combat international competition. Competition never leaves the price war between the price tag by competing companies which is by and large affected due to cost of raw material. Therefore, to be a market leader in both domestic and global market, the Indian government should come forward to the aid of industry in terms of cost of basic raw material at an affordable cost. One of the basic cost of production is electricity for which the country largely depends upon thermal power. The cost of thermal power being high due to factors discussed above, we need to explore alternative sources of energy.

The study also indicates that consumption of coal will exceed coal production and the saturation point of coal consumption and production will reach by mid 21st century not only in India but also all over the world. Therefore, the decision makers must be concerned with uncertainty and non-availability of coal for generation of electricity. We need to explore avenues for generation of electricity through alternative sources for sustainability of country's economy.

APPENDIX

Appendix A: An Akaike Information Criterion

It is defined as $\ln AIC = \left(\frac{2k}{n}\right) + \ln\left(\frac{RSS}{n}\right)$. In comparing two ARIMA models, the model with the lowest value of AIC is preferred.

Appendix B: Autocorrelation Function

The autocorrelation function is defined as $\rho_k = \frac{\gamma_k}{\gamma_0} = \frac{\text{covariance at lag } k}{\text{variance}}$. On the basis of autocorrelation function we can determine the lag length and the value of p, q and d.

MEAN-REVERSION OF NET PROFITABILITY AMONG POLISH PUBLIC COMPANIES

Jacek Welc, Wroclaw University of Economics

ABSTRACT

Abundant research shows that corporate financial results are characterized by the long-term reversion toward the levels average for the whole economy. In the case of earnings this means that companies which in a given year show above-average profitability in the following periods express the tendency to show decreasing profitability and companies which in a given year show below-average profitability in the following periods express the tendency to show increasing profitability. In the paper we explore the reversion toward the mean of the net profitability of companies listed on the Warsaw Stock Exchange in the period of 2000-2009 years. The research confirmed the strong tendency of net profitability to revert toward the economy-wide mean.

INTRODUCTION

Abundant research shows that corporate financial results (measured e.g. by sales growth, profitability, earnings growth, leverage, etc.) are characterized by the long-term reversion toward the levels average for the whole economy. In the case of earnings this means that companies which in a given year show above-average profitability in the following periods express the tendency to show decreasing profitability and companies which in a given year show below-average profitability in the following periods express the tendency to show increasing profitability. These findings are very important for long-term financial forecasting, performance analysis, planning capital expenditures and in making strategic decisions within organizations. Knowledge about the time-series properties (including mean-reversion) of corporate financial results can be very helpful especially in preparing forecasts necessary for making valuations and credit-risk analyses. This paper explores the phenomenon of mean-reversion on the basis of data concerning net profitability of companies listed on the Warsaw Stock Exchange in 2000-2009 years.

The remainder of the paper is organized as follows. In the next section we discuss the relevant literature. Next the data and methodology used in the study are described. Then the section that presents the empirical results follows. The paper closes with concluding comments.

LITERATURE REVIEW

Forecasting corporate earnings constitutes an essential element of most models of corporate financial analysis and valuation (Moyer, McGuigan, Kretlow, 1995; Penman, 2007; DePamphilis, 2008). Analysts, when making forecasts, usually exploit a wide range of available information concerning the company under investigation (e.g. planned marketing activities, sales breakdown, employment, fixed-assets investment, etc.) as well as its economic environment (e.g. business climate, competitors' behavior, customer' preferences, exchange rates, etc.). The second approach to forecasting earnings is based solely on corporate historical financial results and the predictions are made with the use of mechanical methods (e.g. autoregressions) and/or on the basis of the knowledge of general time-series properties of corporate financial results. Despite the use of wide range of information the quality of analysts' forecasts is controversial and the research on analysts' forecasts relative accuracy is not unequivocal. Some research, conducted for the companies listed on American stock exchanges, points to the superiority (as regards accuracy) of analysts' forecasts over mechanical predictions (White, Sondhi, Fried, 2003; Brown, Lawrence, 1996; Chatfield, Moyer, Sisneros, 1989), but other research indicates a higher accuracy of simple (in some cases even naïve) forecasting methods in comparison with analysts' predictions (Dreman,

1998; Malkiel, 2007). Other research points to the analysts' superiority in forecasting with one-quarter ahead to two-quarter ahead horizon, comparable accuracy in forecasting with three-quarter horizon and the superiority of mechanical methods in the case of longer horizons (O'Brien, 1988; Rothovius, 2008).

Given the fact that in the case of long-term earnings predictions the analysts and their detailed forecasting approaches seem to be no significantly better than simple mechanical methods, knowing long-term properties of corporate financial results can be extremely helpful in forecasting these results. Abundant research shows that the characteristic feature of corporate financial results (measured by e.g. sales growth, profitability, etc.) is a long-term reversion of those results toward the economy-wide average levels (Fama, French, 1999; Hwang, Keil, Smith, 2005; Bajaj, Denis, Sarin, 2000; Murstein, 2003). One research found that from 1960 through 1999 only 8 of the largest 150 companies on the "Fortune 500" list managed to increase their earnings by an annual average of at least 15% for two decades (Loomis, 2001). The other research, based on five decades of data, showed that only 10% of large U.S. companies had increased their earnings by 20% for at least five consecutive years, only 3% had grown by 20% for at least 10 years straight, and not a single one had done it for 15 years in a row (Zweig, 2001). This means that maintaining above-average pace of corporate earnings growth is extremely difficult in the long-run. This mean-reversion of earnings is partially caused by mean-reversion of corporate profitability (i.e. ratio of net earnings to revenues or to total assets or to shareholder's equity). This means that the companies that in a given period show above-average (below-average) profitability in the following periods express the tendency to experience decrease (increase) of this relative (i.e. compared to the wide-economy average) profitability. Palepu, Healy and Bernard confirm this on the basis of the American data, stating that "firms with abnormally high (low) ROE (i.e. return on equity) tend to experience earnings declines (increases)" (Palepu, Healy, Bernard, 2004). Nissim and Penman also state that firms with high current core return on assets tend to have declining profitability in the future and firms with low return on assets tend to have increasing profitability in the future (Nissim, Penman, 2001).

However, despite its high importance for earnings forecasting, reversion toward the mean seems to be neglected or even unknown by most financial analysts. One research found that the consequence of this neglect is the fact that the most optimistic and most pessimistic earnings forecasts are usually too optimistic and too pessimistic and the forecasts' accuracy can be improved by shrinking them toward the mean (Hwang, Keil, Smith, 2004). This is strongly confirmed by other research, made on the basis of data covering 1985-2007 years, according to which analysts expect U.S. growth companies to increase earnings in the future by about 17% per annum on average (against 16% per annum on average in the past), while the actual delivered growth averages only about 7% per annum (Montier, 2009). Similar findings were obtained for European public companies, in which case analysts expect the growth stocks to deliver around 16% p.a. (close to the historical performance of 17% p.a.), while the actual delivered earnings growth averages around 5% p.a. over the long term.

In the previous research we examined the presence of mean-reversion in the case of the sales growth of Polish public companies (Welc, 2010). That research strongly confirmed the tendency of corporate sales growth to revert toward the mean (within 3 to 4 years). However, the hypothesis of mean-reversion of Polish companies' profitability hasn't been tested so far. Therefore in this paper we explore the long-term properties of net profitability (measured as the ratio of net earnings to revenues) of the companies listed on the Warsaw Stock Exchange.

DATA AND METHODOLOGY

In the research the data concerning yearly net profitability of companies listed on the Warsaw Stock Exchange were used. The historical financial results were obtained from *Notoria Serwis* database. In the sample we included the companies for which all the necessary data were available. Due to significant accounting differences we omitted all the financial companies (mostly banking and insurance

corporations) as well as The National Investment Funds. The analysis comprised the period between the 2000 and 2009 (the earlier periods were omitted due to quite a small number of then listed companies). The only analyzed variable was the corporate net profitability defined as follows:

$$NP_t = \frac{E_t}{NS_t}, \quad (1)$$

where:

NP_t - net profitability of a given company in year t ,

E_t - net earnings of a given company in year t ,

NS_t - net sales of a given company in year t .

The summary statistics of the data used are presented in the table below.

Table 1: Summary statistics computed for net profitability* in the analyzed samples.

Year	Arithmetic average	Median	Standard deviation**
2000	-3.2%	1.9%	33.0
2001	-4.8%	0.5%	28.9
2002	-3.7%	1.1%	35.8
2003	-1.2%	2.1%	29.8
2004	4.2%	4.0%	14.9
2005	5.5%	4.6%	30.2
2006	-0.2%	5.1%	128.2
2007	6.2%	5.9%	46.7
2008	-6.3%	3.0%	115.4
2009	-11.4%	1.9%	70.5

* net profitability as defined by equation (1)

** in percentage points

This table shows the summary statistics computed for net profitability of companies listed on the Warsaw Stock Exchange.

Source: Notoria Serwis; author's calculations.

The whole sample under investigation was divided into five moving sub-samples (each sub-sample comprised six years). The first sub-sample embraced the period between 2000 and 2005, the second one embraced 2001-2006 period, etc. The last sub-sample embraced the period between 2004 and 2009. In each of the sub-samples we visually analyzed the reversion toward the mean of the corporate net profitability.

In the case of the first sub-sample all the companies under investigation were sorted in order of decreasing profitability in the 2000 (from the company with the highest profitability to the company with the lowest profitability in 2000). The net profitability data computed for the individual companies were then normalized with the following formula:

$$NNP_t^i = NP_t^i - MedianNP_t^n, \quad (2)$$

where:

NNP_t^i - normalized net profitability of i -th company in year t ,

NP_t^i - net profitability of i -th company in year t (as defined by formula 1),

$Median NP_t^n$ - median net profitability of all n companies in year t ,

n – number of companies included in the sample in year t .

Then the sorted companies were divided into ten deciles so that the first decile embraced 10% of companies with the highest net profitability in 2000 and the last decile embraced 10% of companies with the lowest net profitability in 2000. Because total number of observations cannot be divided equally into ten deciles we omitted from the computations the proper number of the observations with the lowest profitability. For each of the deciles constructed in this way the median normalized net profitability in 2000 was computed. Then the median normalized net profitability in the following five years was computed for the same deciles. Analogous computations were made for the remaining four sub-samples (comprising 2001-2006, 2002-2007, 2003-2008 and 2004-2009 sub-periods). Then the results obtained in all the sub-samples were averaged.

The methodology described above enabled visual inspection of the mean-reversion of the corporate net profitability. It enabled observation of the path and the pace of the decrease / increase of the median profitability in the deciles with the highest / lowest initial net profitability.

THE RESULTS

Figure 1 presents the phenomenon of reversion toward the mean in the case of normalized net profitability in the first sub-sample (comprising 2000-2005 years). The figure shows the medians of normalized net profitability in ten deciles formed on the basis of the data for 2000 year. As can be seen, there was the tendency of reversion toward the mean of normalized net profitability in the period under investigation (especially in the case of the two extreme deciles).

Figure 1: Medians of normalized net profitability* in ten deciles of companies in 2000-2005 sub-sample.

* normalized net profitability was computed as the difference (in percentage points) between net profitability of a given company and the median net profitability among all the listed companies in the same period

** 10% of companies with the highest net profitability in 2000

*** 10% of companies with the lowest net profitability in 2000

2000 is the year for which the initial sort of all the companies is made.

This figure presents the relative net profitability in ten deciles of companies listed on the Warsaw Stock Exchange in 2000-2005 years.

Source: Notoria Serwis; author's calculations.

The data shown in Table 2 and on Figure 2 present the averaged numbers for all five sub-samples. For example, the value for the first decile in year T (equaling 0.13), where T is the year for which the initial sort of all the companies is made, constitutes the arithmetic average of the five values of medians of normalized net profitability obtained for the first decile in the first year of all five sub-samples. This number (equaling 0.13) means that the median net profitability in the group of 10% of companies with the highest profitability in any given year is on average about 13 percentage points higher than the median net profitability in the group of all the companies listed on the Warsaw Stock Exchange in the same year. Analogously, the value for the first decile in period T+1 (equaling 0.12), where T+1 is the year following the year for which the initial sort of all the companies is made, constitutes the arithmetic average of the five values of medians of normalized net profitability obtained for the first decile in the second years of all five sub-samples. This number (equaling 0.12) means that the median net profitability in the group of 10% of companies with the highest profitability in period T, which in period T is on average about 13 percentage points higher than the median net profitability in the group of all the companies, in the following year (i.e. T+1) is on average about 12 percentage points higher than the median net profitability in the group of all the companies.

As it can be seen on the Figure 2, the 2000-2009 years were characterized by a significant reversion toward the mean of net profitability of companies listed on the Warsaw Stock Exchange. In the periods under investigation the median normalized net profitability in the first decile in period T averaged 0.13. That means that the median profitability in the first decile exceeded the median profitability among all the companies by about 13 percentage points on average. The analogous value for the tenth decile averaged -0.18. That means that the median net profitability in the tenth decile in period T was lower than the median net profitability among all the companies by about 18 percentage points on average. However, this difference starts to diminish as soon as in the following year. The distance between the highest and the lowest value of median normalized profitability (i.e. between the medians in the first and the last decile), that in year T averages 32 percentage points, in the following year declines to 20 percentage points, and in years T+2, T+3, T+4 and T+5 declines further to 12, 9, 6 and 3 percentage points, respectively. The observation of the median normalized net profitability in the remaining deciles brings similar findings. The distance between the second highest and the second lowest value of median normalized net profitability (i.e. between the medians in the second and the ninth decile), that in year T averages 14 percentage points, in the following year declines to 8 percentage points, and in years T+2, T+3, T+4 and T+5 declines further to 7, 5, 3 and 4 percentage points, respectively. However, it should be noticed that despite the discernible reversion toward the mean, in all the periods between T+1 and T+5 the relative net profitability in the first two deciles remains on the above-average levels. Despite the evident mean-reversion, the distance between the median profitability in the first two and the last two deciles doesn't converge to zero within the analyzed five-year timeframe (regrettably we don't have time-series of data long enough to enable conducting the research within the longer timeframes).

The visual inspection conducted so far showed that the reversion toward the mean was evidently present in net profitability of the companies listed on the Warsaw Stock Exchange in 2000-2009 years. It means that if in any year any company experiences above-average (below-average) net profitability, this relative profitability usually declines (rises) in the following years toward all-the-companies average level. Given the fact that the total reversion toward the mean seems to take more than 5-6 years (at least in the case of the extreme deciles), the quantification of the average pace of this reversion was conducted. In order to evaluate the average pace of reversion toward the mean we computed, for all the deciles, the difference between the average median normalized net profitability in the year T+1 and the average median normalized net profitability in the year T. These computations are shown in the Table 3.

Table 3: Averaged medians of normalized net profitability in T and T+1 years and changes of those medians in year T+1 relative to year T.

	Period		Change from T to T+1*
	T	T+1	
Decile 1	0.13	0.12	-0.010
Decile 2	0.07	0.04	-0.023
Decile 3	0.03	0.02	-0.009

Decile 10	-0.18	-0.07	0.111

* median normalized net profitability in a given decile in year T+1 subtracted from median normalized net profitability in the same decile in year T

This table shows the changes (between T and T+1) of relative net profitability in ten deciles of companies listed on the Warsaw Stock Exchange in 2000-2009 years.

Source: Notoria Serwis; author's calculations.

In the analyzed 2000-2009 years the median net profitability of companies making the first decile exceeded the median net profitability of all the companies in the period T by about 13 percentage points. However, after one year the median normalized profitability in this decile decreased by the average of 1 percentage point. Similar situation occurred in the case of 2nd, 3rd, 4th and 5th decile (i.e. the deciles composed of companies with the above-average net profitability in year T) and a bit surprisingly in the case of 6th and 7th decile. The opposite situation occurs in the case of 8th, 9th and 10th deciles (i.e. the deciles composed of companies with the below-average net profitability in year T). The median normalized net profitability of companies making the 10th decile was lower than the median net profitability of all the companies in year T by 18 percentage points on average. However, in the following year the significant reversion toward the mean occurs (median normalized profitability in the last decile rises by an average of 11.1 percentage points). However, despite the evident reversion toward the mean it should be noted that the changes of the median normalized net profitability in the deciles (shown in the last column of Table 3) do not rise monotonically with the movement from the highest deciles to the lowest deciles.

The data from the second and the last column of Table 3 enabled the quantification of the pace of reversion toward the mean. Figure 3 presents the relationship between the averaged values of median normalized net profitability in individual deciles (these are data from the second column of Table 3) and the changes of those medians ensuing in the following year (these are the data from the last column of Table 3). Because we approximated this relationship with the assumption of non-linearity (which requires all the observations to have non-negative values when estimating regression coefficients), we modified all the observations (regarding both variables under investigation), so that the lowest original observation among both variables (equaling -0.18 in this case) now has the value of unity and all the other observations equal:

$$MV_k^i = OV_k^i - OVMIN + 1, \quad (3)$$

where:

MV_k^i - modified value of i -th observation of k -th variable,

OV_k^i - original value of i -th observation of k -th variable,

$OVMIN$ - minimal value among the original observations of both variables (-0.18 in this case).

Thanks to this modification of the observations' original values the distances between the individual observations are the same (as between the original observations) but now all the observations have positive values. This enables estimation of the non-linear regression shown on the Figure 3.

In the analyzed periods there was the statistically significant negative relationship between the companies' relative net profitability in period T and later (in period T+1) changes of this relative profitability. This negative relationship is statistically significant with F statistic equaling 36.8 (indicating statistical significance on 1% significance level) and quite strong (given the coefficient of determination equaling 0.821). This confirms that companies with the above-average (below-average) net profitability in any given year tend to experience the decrease (increase) of this relative profitability toward all-the-companies average levels in the following year.

Figure 3: The relationship between the medians of normalized net profitability in ten deciles of companies in year T and the changes of these medians in the same deciles in year T+1.

* median normalized net profitability in a given decile in year T+1 subtracted from median normalized net profitability in the same decile in year T

This figure presents the relationship between the relative net profitability in period T and the changes of this relative profitability in the following year.

Source: Notoria Serwis; author's calculations.

The log-linear regression shown on Figure 3 enabled the simulation of the path of relative net profitability of companies from different deciles in a ten-year timeframe. The estimated regression enables the calculation of the expected scope of next-year (i.e. T+1) reversion toward the mean for any initial (i.e. in year T) value of normalized net profitability. Recalculation (on the basis of the same regression coefficients) made for the further years (after year T+1) permits obtaining a long-term reversion-curves (on the assumption that in all those years the regression coefficients are constant).

Figure 4 presents the paths of the reversion of corporate relative net profitability simulated for the ten initial values (these were the actual values of the medians for the ten deciles shown in the second column of Table 3). The figure shows that according to the estimated regression (describing reversion of corporate net profitability toward the mean) this reversion takes on average 8-9 years in the case of companies listed on the Warsaw Stock Exchange (on the assumption, that the regression coefficients are stable). Companies with above-average (below-average) net profitability in any given year tend to show lower (higher) relative net profitability in the following years. The initial above-average (below-average)

net profitability in the following years systematically approaches all-the-companies average levels. However, according to the estimated log-linear regression, this process takes on average about 8-9 years.

Figure 4: Ten-year reversion curves of normalized net profitability* of the companies listed on the Warsaw Stock Exchange simulated on the basis of estimated log-linear regression.

* the difference between net profitability of a given company and median net profitability among all the companies listed on the Warsaw Stock Exchange

CONCLUSIONS

The research presented in this paper (based on the data concerning net profitability of the companies listed on the Warsaw Stock Exchange in 2000-2009 years) found that the relative corporate net profitability tends to revert toward the mean. In the analyzed sample of public companies the statistically significant negative relationship between the relative (i.e. in relation to the average for all the companies) net profitability in a given year and the changes of this relative profitability in the following years was detected. It means that companies characterized by above-average (below-average) net profitability in any year usually experience significant decrease (increase) of this relative profitability toward the economy-wide levels in the following years. However, according to the obtained estimates, the process of total reversion to the mean takes about 8-9 years.

ABSTRACT

In the turbulent global economy, mergers and acquisitions of industries are taking place between the investors with a view to protect the business. Such mergers & acquisitions are not only taking place in Heavy Industries like Iron & Steel, Pharmaceutical sector but also in major service industries. This paper aims at investigating the context, process and consequences of merger of State Bank of Indore with largest nationalized banking industry i.e. State Bank of India. The researchers strongly felt that due to inadequate emphasis on human resource aspect, employee resistance acted as impediment to merger of these two banks and delayed the process though, in fact it was done in financial interest and administrative convenience of the stakeholders and service holders. This paper has developed a model, which can help the industry, both in manufacturing and service sector for smooth change over without employee resistance.

JEL: G34; C38

KEY WORDS: Turbulent global economy, Mergers and Acquisitions, Impediment to merger

INTRODUCTION

Mergers and acquisitions had a significant impact on the banking industry in India and around the world, in the global regime. As a result, many bank employees have experienced numerous psychological effects of mergers and acquisition. Acquisitions are often seen to have negative impacts on employee's behavior, resulting in counter productive practices, absenteeism, low morale and job dissatisfaction. During the last few years, few acquisitions took place. Important mergers and acquisitions in India in recent years include the merger between IDBI (Industrial Development bank of India) and its own subsidiary IDBI Bank. The deal was worth \$ 174.6 million (Rs. 7.6 billion in Indian currency) . Another important merger was that between HDFC and Centurion Bank and Bank of Punjab worth of \$ 82.1 million (Rs. 3.6 billion in Indian currency). This merger led to the creation of the Centurion Bank of Punjab with 235 branches in different regions of India. ICICI bank took over Bank of Rajasthan for \$ 325 million . State Bank of India took over State Bank of Indore. The State Bank of India itself has huge international network, including, global operations contributing to 14 per cent to the top line .

In this paper, authors have examined the effects of merger and acquisition on the morale and psychology of employees in the State Bank of Indore. It identified the different stages of mergers and acquisition and the problems arising out of the exercise; various factors related to post merger and acquisition namely openness, timely, and accurate communication with employees, which could reduce the negative psychological and behavioral burden, thereby reducing employee's anxiety, uncertainty, confusion, grapevines and labor turnover. Through factor Analysis, the researchers attempted to identify the most important factors, which encouraged the employees to accept mergers & acquisitions without resistance. In this study, Section 2 briefly discusses about literature survey. Section 3 refers to the data selection,

research methodology and empirical models. Section 4 provides analysis and interpretations of the empirical findings and section 5 presents the conclusion.

Merger Defined: Merger can be defined as combination of two or more companies into a single company where one survives and the other lose their corporate existence. The survivor acquires the assets as well as liabilities of the merged company or companies. Generally, the company, which survives, is the buyer, which retains its identity and the seller company is extinguished.

Acquisition Defined: A corporate action in which a company buys most, if not all, of the target company's ownership stakes in order to assume control of the target firm. Acquisitions are often made as part of a company's growth strategy whereby it is more beneficial to take over an existing firm's operations and niche compared to expanding on its own. Acquisitions are often paid in cash, the acquiring company's stock or a combination of both.

Indian Scenario: Indian companies have already started the acquisition of industries in the international market. For example, Wipro and Infosys in IT sector, the steel magnets like L.N.Mittal took over Arcelor and Tata Steel took over Corus¹⁰. Hutch was taken up over by Vodafone.

Purpose Of Mergers & Acquisitions: Purpose of Mergers & Acquisitions are procurement of suppliers through safeguard the source of suppliers of raw materials, obtain economies of scale. Market expansion strategy through eliminate competition and protect existing market, diversification of product, strategic control of patents and copyrights. Financial strength through improve liquidity and have direct access to cash resources, enhance gearing capacity, borrow on better strength and greater asset backing, improve EPS.

Types Of Mergers: There are various types of mergers are vertical merger i.e. a company would like to takeover another company or seek its merger with that company to expand espousing backward integration to assimilate the sources of supply and forward integration towards market outlets. Horizontal merger i.e. merger between two competing firms which are at the same stage of industrial process. The acquiring belongs to the same industry as the target company. Circular merger i.e. companies producing distinct products seek amalgamation to share common distribution and research facilities to obtain economies by elimination of cost on duplication and promoting market enlargement. The acquiring company obtains benefits in the form of economies of resource sharing and diversification. Conglomerate merger i.e. amalgamation of two companies engaged in unrelated industries. Within stream merger i.e. when subsidiary company merges with parent company or parent company merge with subsidiary company. Defensive merger i.e. the directors of a threatened company may acquire another company for shares as a defensive measure to forestall the unwelcome takeover bid.

Types of Acquisitions or Takeovers: There are two types of takeover bids. Friendly takeovers i.e. mergers and acquisition take place through negotiation between two companies. Hostile takeovers i.e. an acquirer company may not offer to target company the proposal to acquire its understanding but silently and unilaterally may pursue efforts to gain controlling interest in it against the wishes of the management. The economic history of mergers has been divided into *Merger Waves* based on the merger activities in the business world (Tabla1).

Laws Governing Mergers & Acquisitions In India: There are various laws govern mergers & acquisitions in India. They are Companies Act, 1956; Industrial (Development & Regulation) Act, 1951; Monopolies & Restrictive Trade Practices Act, 1969; Competition Act, 2002; Foreign Exchange Management Act, 1999; Sick Industrial Companies (Special provisions) Act, 1981; Income Tax Act, 1961; Securities Contract (Regulation) Act, 1956; Securities & Exchange Board of India Act, 1992; SEBI (Substantial Acquisition of shares & Takeovers) Regulations, 1997.

Table: 1 Merger Waves

Period	Name	Facet
1889–1904	First Wave	Horizontal mergers
1916–1929	Second Wave	Vertical mergers
1965–1989	Third Wave	Diversified conglomerate mergers
1992–1998	Fourth Wave	Conglomerate mergers; Hostile takeovers; Corporate Raiding
2000 onwards	Fifth Wave	Cross-border mergers

Source: http://en.wikipedia.org/wiki/Mergers_and_acquisitions

Impact Of Mergers & Acquisitions In Indian Context: The impact of the M & A process on the employees is found to be similar irrespective of the geography and location of these Mergers activity. In India, the effect and defects of the merger process have been experienced as below:

The joint venture between Proctor & Gamble and Godrej collapsed due to the lack of HR synergies in the two organizations. When Sify's e-business division was merged with Satyam, the merger created a whole lot of technical confusion, which was caused because of differing views of the employees on issue related to technology integration and development practices. The HR department was found to be clueless about solution. The Grasim and L & T merger also threw up interesting HR issues.

LITERATURE REVIEW

Weston and Mansingka: studied the pre and post-merger performance of conglomerate firms, and found that their earnings rates significantly underperformed those in the control sample group, but after 10 years, there were no significant differences observed in performance between the two groups. The improvement in earnings performance of the conglomerate firms was explained as evidence for successful achievement of defensive diversification.

As per McKinsey & Company, India Banking 2010 report, though policy have been made, but still there are some constraints to reach the high performance in the Indian banking sector. In public sector banks, policy should be redrafted to make them competitive in the global exposure. Due to Merger & Acquisition there are 35 % significant growth has seen in Indian private banks. Foreign banks also grow faster at 30 per cent due to a relaxation of some regulations. The shares of banking sector value add to GDP increases to over 4.7 per cent.

Basant (2000): suggests that economic reform in the Indian economy has significantly reduced micro-economic rigidities and enhanced competitive pressures. In response, firms have undertaken corporate restructuring activity in order to retain competitiveness and increase their value.

Beena (2004): finds evidence of mergers within the same group with the motive of consolidation of control to protect against takeovers but does not find any role of Efficiency-related parameters in determining merger activity in India. The author instead suggests a merger motive of growth in size by acquiring higher equity.

In a paper, Andrade and Stafford (2004) determine motivating factors for mergers both at industry and firm levels. The authors investigate the economic role of mergers in the US by performing a comparative study of mergers and other forms of corporate investment at both industry and firm levels. They find that industry capacity utilization has opposite effects on merger and non-merger investments particularly during the 1970s and 1980s. While excess capacity drove industry consolidation through mergers, peak capacity utilization induced industry expansion through non-merger investment..

Maquieira, Megginson, and Nail (1998): examine 260 mergers in the US between 1963

Moreover, 1996 and record significant net synergistic gains in non-conglomerate mergers and insignificant net gains in conglomerate mergers.

Rhodes-Kropf, Robinson & Vishwanathan (2004): merger waves occur when the aggregate industry market valuation, measured as market to book value ratio, is higher compared to various estimates of true valuations. The authors note that these valuations could be both due to misplacements and actual presence of growth opportunities.

DATA AND METHODOLOGY

The data for this research has been collected both from primary and secondary sources. Primary data has been collected through a survey of 58 employees of State Bank of Indore in different branches in Kolkata, West Bengal. The questionnaire consisted with 20 close-ended questions where the respondents have given their view against the scale of 1 to 5 where 1 was strongly disagree, 2 was disagree, 3 was somewhat agree, 4 was agree & 5 was strongly agree. The secondary data has been collected from the published data & the report of State Bank of India. Different books, journals and electronic data have also been used. Using the concept of Factor Analysis has tested the hypothesis.

A Case From Indian Banking Sector

The Union Government approved the acquisition of the State Bank of Indore by the State Bank of India through amendments in the State Bank of India (Subsidiary Banks) Act, 1959. Following the acquisition, all branches of the State Bank of Indore came under control of State Bank of India branches in the respective states thereby saving substantial administrative cost. The acquisition helped in spreading the credit risk of the State Bank of Indore as the concentration risk to which the bank was exposed. Keeping in view the growing economy, State Bank of Indore required larger equity capital to support a growing balance sheet. State Bank of India raised equity capital, as State Bank of Indore did not exist effective 26.08.2010. Merger was expected to avoid competition between two entities and lead to easy access to funds at competitive rates in the banking sector. Customers, including depositors of the State Bank of Indore were able to operate their accounts as customers of State Bank of India effective the same date. Trade union leaders of State Bank of Indore protested the merger of State Bank of Indore with State Bank of India highlighting the loss of benefits in terms of housing loan, car loan, personal loan etc. However, with the passage of time, the union lost its significance and the issues of employee benefits in post merger period are currently under discussion. Since mergers & acquisitions are regular in Indian industries, the researchers have developed a model for smooth transition of business arising out of this exercise.

The Model

As the purpose of this paper is to show and explain the use of factor analysis in decision making of merger and acquisition, the theoretical aspects of merger and acquisition are discussed from a practical, applied perspective.

The underline assumption of factor analysis is, all variables within a particular group are highly correlated among themselves but have relatively small correlations with variables in a different group.

An orthogonal factor model with 'n' common factors is representing as:

$$X_{(p \times 1)} = \mu_{(p \times 1)} + L_{(p \times n)} F_{(n \times 1)} + \varepsilon_{(p \times 1)}$$

Where X is the observed random factor, with p components, has mean μ and covariance matrix Σ .

The factor model X is linearly dependent upon a few numbers of observable random variables $F_1, F_2,$

F_3, \dots, F_n , called common factors and p additional sources of variation $\varepsilon_1, \varepsilon_2, \varepsilon_3, \dots, \varepsilon_n$, called error.

In practical, the factor model can be written as:

$$X_1 = \mu_1 + l_{11}F_1 + l_{12}F_2 + + l_{1n}F_n + \varepsilon_1$$

$$X_2 = \mu_2 + l_{21}F_1 + l_{22}F_2 + + l_{2n}F_n + \varepsilon_2$$

.....

.....

$$X_n = \mu_n + l_{n1}F_1 + l_{n2}F_2 + + l_{nn}F_n + \varepsilon_n$$

The coefficient l_{ij} is called the loading of the i -th variable on the j -th factor, so the matrix \mathbf{L} is the matrix of factor loadings. We apply the concept of principal component and the varimax procedure to get an appropriate result of factor analysis. The principal component factor analysis of the sample covariance matrix is specified in terms of eigenvalue-eigenvector pairs. In principal component analysis, it is assumed that the communalities are initially 1. In other words, principal component analysis assumes that the total variance of the variables can be accounted for by means of its components (or factors), and hence that there is no error variance.

The extraction of principal components or factors in principal component analysis takes place by calculating the eigenvalues of the matrix. The number of positive eigenvalues determines the number of dimensions needed to represent a set of scores without any loss of information. Hence, the number of positive eigenvalues determines the number of factors/components to be extracted. The construction of the factor itself is then calculated via a transformation matrix that is determined by the eigenvectors of the eigenvalues. After constructing the factors, it is possible to determine the factor loadings simply by calculating the correlations between the original variables and the newly obtained factors or components. It is furthermore always important to check the communalities after factor extraction. If the communalities are low, the extracted factors account for only a little part of the variance, and more factors might be retained in order to provide a better account of the variance. A convenient way to check whether the sample is big enough or not to apply a factor analysis we used Kaiser-Meyer-Olkin measure of sampling adequacy (KMO-test). The sample is adequate if the value of KMO is greater than 0.5.

In factor analysis the variables have to be inter correlated, but they should not correlate too highly (extreme multi-co linearity and singularity) as this would cause difficulties in determining the unique contribution of the variables to a factor . The inter-correlation can be checked by using Bartlett's test of sphericity, which "tests the null hypothesis that the original correlation matrix is an identity matrix" . This test has to be significant: when the correlation matrix is an identity matrix, there would be no correlations between the variables. If the determinant is greater than 0.05, then there is no multi-co linearity.

EMPIRICAL RESULTS

The first factor consists mainly of degrees of awareness for future growth and prospect of an employee after the merger and acquisition i.e. Loss of self Actualization, Increased work pressure after acquisition, Complicated Process of service, Employee Consultation, Change of hierarchy. The second factor consists mainly of degrees of uncertainty of an employee after the merger and acquisition i.e. loss of identity, New rules and regulations, Work culture, Restructuring of key positions.

The third factor consists mainly of degrees of future growth of industry after the merger and acquisition i.e. Prestige, power and status, Bank can compete with global banks, Improved service quality, HR's role in acquisition, Future benefit

Based on Primary Data on State Bank of Indore

In the global economic context, merger and acquisition of new and related industries are common phenomenon. Employees are generally apprehensive of loss of job or stagnation in the job or new policies and procedures adopted by the organization acquiring another organization or one company merging with another company. Employee resistance in this situation often delays the process and adversely affects the business for the investors. While the investors pay adequate attention towards compliance of the provisions of various Indian Laws as mentioned earlier, changing business scenario and turnover arising out of such mergers and acquisitions, little attention is paid towards emotional and psychological aspects of the employees at all levels. This paper recommends that HR have a critical role to play in maintaining transparency in communication regarding the need for merger & acquisition and its effect on working and

service conditions of the employees. The major three factors as revealed from the study are: degree of awareness for future growth & prospect of employees, degree of uncertainty of the employees and degree of future growth of the industry. This paper recommend that a pre merger task force should be prepared, to take the feedback from the employees and make them understand the effects and the benefits of Mergers & Acquisitions in formal and informal platforms.

BIAS IN COMMUNICATION: A STUDY IN THE CONTEXT OF INDIA'S BUSINESS WORLD

Minakshi Pal, Techno India Institute of Technology, India

Sukanya Ghosh, Meghnad Saha Institute of Technology, India

Partha Pratim Sengupta, National Institute of Technology, Durgapur, India

ABSTRACT

Effective communication is an integrated part of any successful business. Reading, writing, speaking, listening and interpersonal communication are the five top criteria in defining effective communication. However, any bias in communication can adversely affect a business. In this paper, we discuss speech bias in verbal communication. We also focus on the positive and negative aspects of such communication and suggest ways of improving one's skills in speech.

INTRODUCTION

In today's dynamic world of business, communication plays a very vital role in the success of an organization. People with diverse backgrounds, different cultures, varied qualifications, contrasting experiences and unique skills form the greatest assets of an organization, or rather the organization itself. The force that can hold them together and pave the path to success is Effective Communication. It binds every single employee with every other employee, every employee with his superiors and all the employees with the organization. Earlier, communication was considered as a source of control and power, but today it is more liberal; every employee has the right to access the information he needs.

In the multicultural and pluralistic business world of India, it is significantly important to understand the importance of communication as a skill requirement for business success. A look at the demographic makeup of most of our companies confirm that there are representatives from different cultures, religion, languages, customs and traditions inside, as well as outside, the company walls. Bias in communication can cause misunderstanding and potential disruption in productivity, which can have a very long lasting adverse effect. It can also have a negative effect on employee morale, which in turn affects the organization. Due to mergers and acquisitions and huge layoffs, employees these days feel more disconnected from their employers.

In this paper, we study one such bias in communication that is observed in India's present business world, and discuss in details the possible solutions to it.

LITERATURE SURVEY

The literature on business communication is vast. Some of the recent studies carried out have taken into consideration the different aspects of effective interaction within and between organizations. Jabs (2005)⁷ discussed the rules of communication and methods of decision making in organizations. Singh (2007)¹¹ investigated a conceptual model to study the effect of managerial communication styles on employee outcomes. Lan (2007)⁴ indicated the problems of intercultural business communication when a disaster hits, and also focused on the positive and negative experience and the pros and cons. Madlock (2008)⁸ studied the link between leadership technique and competence of the communicator and employee satisfaction. A thematic analysis of US and Latin American CEO letters have been carried out by Conaway and Wardrope (2010)¹⁰ to investigate whether choice of words really matter. The effect of verbal aggressiveness and mentoring of the supervisor on the subordinates have been studied by Madlock and Kennedy-Lightsey (2010)⁹.

THE INDIAN SCENARIO

India being a multi cultural, multi linguistic country has given birth to innumerable attitudinal approaches to life which are reflected not only in personal but also professional interactions. However, this is not true of all professionals. In pursuit of sound academics boys and girls have moved to other cities, stayed in boarding accommodations or as paying guests or just renting an apartment in a group. Whenever living has been intercultural the young minds eager to learn new things have learnt to adopt and accept the cultural differences. As a result tolerance and in many cases even liking of the different cultures and regional languages has developed. When these boys and girls as young men and women have joined the big business world they did not suffer cultural shocks from fellow colleagues rather were well equipped to deal with it as familiarity had already sowed its seeds. Biases in these cases were least.

The other side of the curtain has a diametrically different story to relate. Even to this day there exists in certain parts of India the feudal mentality and conservativeness. In this domain we find strict adherence to cultural and societal norms. Here the percentage of participation of the fairer sex in the corporate world is comparatively rather low. In fact, according to the Corporate Gender Gap report brought out by the World Economic Forum on 8 March, 2010, India has the lowest percentage of women employees as compared to USA, Spain, Canada, Finland, Austria, Turkey and Japan. The following figure makes a comparative study based on the figures given by the said report.

Figure 1: Bar diagram indicating percentage of women employment in different countries

In these parts of India women are neglected at the helm of a male dominated society, where submissiveness is the order of the day. The male members, on the other hand, are born and brought up with the concept that they are the most eligible and worthy decision makers and the women should obey them, opposing being almost a sin. This reflects heavily in their communication pattern. When such males ingrained with an unhealthy attitude enter the corporate world biases rule strongly and bias in communication is inevitable.

BIAS IN COMMUNICATION – A STUDY

Bias in communication originate mainly from culture, religion, upbringing, mindset and the like leading to semantic problems, socio-psychological problems, selective perception, hindrance to effective listening and many more. For our study we shall consider bias in speech delivery in communication. Today's highly competitive business scenario has escalated the importance of communication, to be more precise effective communication, a terminology that is now the staple food in all academic areas as well as the

corporate world. However the success of effective communication is dependent on doing away with communication blocks and biases.

We begin our study by defining the three key words of this paper: communication, bias, and biased language. It has been observed that that almost every problem, every conflict, every mistake, and every misunderstanding has at its most basic level a communication problem. **Communication** has thus been defined as a meaningful interaction among people so that the thoughts are transferred from one person to another in such a manner that the meaning and the value of such thoughts are same in the minds of both - the sender of the communication and its receiver. It is the art of getting others to adopt and adapt to your viewpoints, to help them understand why you are excited and optimistic; sad and pessimistic; loving and acceptable; irritated and detestable; or whatsoever may be your emotional state of mind. Communication thus also essentially deals with the transfer of emotion.

Bias: is a term used to describe a tendency or preference towards a particular perspective, ideology or result, and the interference of the tendency with the ability to be impartial, unprejudiced, or objective towards an issue or situation. A bias could, for example, lead one to accept or not-accept the truth of a claim not because of the strength of the claim itself, but because it does or does not correspond to one's own preconceived ideas.

Biased language: is defined as "words and phrases that assign qualities to people on the basis of their gender, race, religion, or physical ability". Beyond the inadvertent use of sexist language, meaning the common practice of using "he" and "man" to refer to men and women, biased language includes "language that denigrates people." Businesses that fail to carefully audit their communications of the presence of biased language risk productivity problems.

The obvious question now is how speech delivery is affected by our bias in communication. For this we will consider few hypothetical situations which nevertheless are true to the Indian business world. In India it is commonplace that the post of Front Office Executive is dominated by the fairer sex. Almost all advertisements with regard to the mentioned post cite their gender criteria. The table below gives few such ads from the internet Google search.

Table 1: Job advertisements for the post of receptionist / front office executive

Ad. No.	Company Name	Post	Location	Required Qualifications	Applications invited from
01	Reliance Industries Limited	Receptionist / Front Office Executive	Offices at Nariman Point, Ballard Estate, Worli, Bandra, Santa Cruz, Reay	Graduate, under 30 years, with a pleasant personality, good	Young, smart lady candidates
02	Manivannan Chit (P) Limited	Front Office Executive	270,KARUPPAIA STREET,NEAR THERMUTTI,	+2 or any degree Key Skills - Office Maintenance	Females
03	Ambest Media, Mumbai	Receptionist	Not mentioned	Handling the entire front office	This is a women only job
04	(Company name not specified)	Front Office Executive	Gurgaon,NCR,Haryana,India	Excellent Communication and Verbal Skills -Should	Only female candidates with pleasing
05	Through TimesJobs.Com	Receptionist	Kolkata	Smart, energetic & motivated female candidates with good	Female

Such job opportunities are flooded on the internet where the position and gender choice of the companies almost always match. Are men not good enough for such jobs? Is there a dearth of good looking men fluent in spoken English? Are men not interested in such jobs? The answer to the first two questions is a

definite “No”. With regard to the third, taking into consideration unemployment status (recorded as 10.7% in 2009) and the insecurity of the taxing jobs in the private sector where each employee is expected to be the knight in shining armor adorned with feathers of success the probable answer to the third question is also “No”. Why then the preference? Choices are many: women may be considered to be more organized in their work; probably exhibit higher patience level; are more courteous; if we desire to be more inclined to the fairer sex then the list is endless. But how does bias in speech delivery in communication feature here. India still being male dominated the male ego is secure in the expectation that the tone of speech though may sound commanding the work will be performed meticulously; ambiguous words would be understood and acted upon failure of which could easily be assigned to inefficiency. Further, the gender and the position both demand submissiveness. With a male in the similar position the threat of being opposed always lingers even though the strings of layoff may be manipulated. But a confrontation would nevertheless create an embarrassing situation. The important C’s of speech *Correct* (correct facts, appropriate time and suitable style), *Clear* (convey clarity of thought and expression), *Complete* (full details), *Concise* (just necessary and sufficient), *Coherent* (well organized), *Courteous* (use of polite words), *Credible* (believable) may be conveniently avoided. Also on an average, women are still paid less than men in the same job.

2. The sales manager of an air conditioning company addresses his team, consisting of men and women, about the winter target.

“Hey guys, winter is setting in and we need to pull up our socks not to beat the winter but to achieve our winter targets. So guys get going. Know your marketing lines and explain to Rajesh he’s rather dull headed”.

In all probabilities such casual approach in manner and speech speak of total breakdown of the corporate decorum. Gender biased words like “guys” are totally unacceptable so also personal comments like “dull headed”. Language should be carefully chosen when communicating to a group. We must avoid words that reflect unfavorably on any group or individual. The use of such language will offend not only the person referred to in the message but also those who respect people, regardless of differences. Inclusive language like “we” should be used instead of gender biased word like “guys” and instead of direct personal attack we must change the language to plural construction such as “we may have our doubts cleared”. Further, commonly used words in the business world that are gender neutral should be replaced to include all people like human resources instead of manpower, staff hours instead of man hours, manufactured instead of manmade, businessperson instead of businessman, sales representative instead of salesman, ordinary terms instead of layman’s terms, to cite a few examples.

3. The superior is approached by an employee for approval of annual leave. Though the employee is eligible to avail the leave the response from the superior is that if work is completed within the target time frame the employee may go on leave. When we consider the response, apparently it sounds absolutely perfect. However, on review it may be observed that the communication though concise, is not clear. Does work completed refer to completion of the particular employee’s assigned work or the department’s completion of the particular work? In this case though no ambiguous word has been used yet the meaning is highly ambiguous. And in most of the situations superiors indulging in such speech style often maintain a distance with their team mates and are not easily approachable. Such style results in an extremely formal work culture where oneness with the superior is not shared by the team members. In all likelihood the required team spirit would be missing and team members would not be performing to the best of their potential as the feeling of well being is absent. However, from the superior’s point of view such purposeful ambiguity is justified to accomplish goals. Such intentionally ambiguity allows divergent interpretations to coexist and are effective in allowing members of diverse backgrounds to work together. However, this cannot call for a healthy working environment as diverse interpretations lead to confusions. Thus speech delivery should be direct and clear and offer no scope for doubts.

4. Such examples are innumerable. However, we need to draw a line and proceed to the findings of the survey conducted on the basis of a questionnaire (see Annexure). The respondents were 30 instructors of different MBA institutions in the country. The main reasons for choosing them were that (i) the management institutions are instrumental in shaping the future of the business world, and (ii) the instructors are in very close proximity to the industries. The questionnaire was based on a scale of 1 to 5 wherein 1 denoted Marginally Agree, 2 Moderately Agree, 3 Considerably Agree, 4 Strongly Agree, and 5 Extremely Agree.

The findings of the survey are given in the following table:

Table 2: Showing the percentage of responses to the different questions

Sl No	Question	1	2	3	4	5
1	Bias in Speech is commonly observed in today's corporate world				87%	13%
2	Females are considered to males in front office jobs			83%		17%
3	Males are also efficient in front office jobs				87%	13%
4	Superiors tend to use ambiguous language to get the job done			50%	33%	17%
5	It is confusing for subordinates when superior's language is ambiguous					100%
6	Healthy transparent communication encourages congenial work atmosphere					100%
7	Often groups are addressed without using inclusive language				83%	17%
8	Casual speech approach spoils the work environment					100%
9	Denigrating remarks by superior is common		33%	33%	17%	17%
10	Coworkers need to be tolerant of cultural and linguistic bias to perform as a team					100%

The study reveals that

- bias in speech is commonly observed in India's business world;
- females are preferred to males in front office jobs, though males are equally efficient;
- the superior's language should be unambiguous to avoid misunderstanding;
- transparency in communication is essential for a healthy, conducive work environment;
- cultural and linguistic bias has a detrimental effect on the team spirit.

CONCLUSION

For a smooth and efficient running of a business it is essential to create a congenial work environment. Communication, especially verbal, plays a major role in achieving the same. Suggestions of ways to improve verbal communication, which can help business people improve their interaction ability, are enumerated below:

- ✚ Use gender neutral words and inclusive language
- ✚ Avoid use of technical jargons. Use easy words for better understanding
- ✚ Establish a common comfortable platform to support effective communication
- ✚ Effective listening should be practiced as opposed to pseudo listening to improve speech delivery because listening is a commitment and a compliment
- ✚ Don't be judgmental
- ✚ Show respect to your communicating partner and be polite

✚ An important dimension of one's communication is one's personality. Use words and combinations of words that not only are understood by the receiver but also reflect your personality and reveal who you are

✚ Recognize your biases and widen your outlook

✚ Emphasize the positive to encourage people

✚ Be consistent in speech to establish credibility

RURAL TOURISM AND IT'S IMPACT ON SOCIO-ECONOMIC CONDITION: A CASE STUDY ON KAMARPUKUR

Nilanjan Ray, Meghnad Saha Institute of Technology
Dillip Kumar Das, The University of Burdwan
Partha Pratim Sengupta, National Institute of Technology
Sukanya Ghosh, Meghnad Saha Institute of Technology

ABSTRACT

This study aims at explorations of rural tourism in West Bengal, India, which acts as an incentive to promote local economy, socio-cultural changes and life style of the people residing around the tourist locations. The purpose of this study is to explore the reasons for which the foreign and domestic tourists visit this location either for religious or for recreational purposes, which in turn has created tremendous impact on local economy, life style and socio-cultural changes among the rural people in and around this tourist destination. In a pilot survey, it has been observed that rural tourism at this location has also improved civic amenities like communication, sanitations, transport facilities and standard of living for the people in general. Keeping in mind India's National Tourist Policy 2002 as promoted by Ministry of Tourism, Government of India, this study aims at assessing the impact of this policy on this rural tourist location in terms of growth of economy, employment potential, livelihood and changes in life style of the local people.

JEL: R11, E27

KEY WORDS: Rural Tourism, Non-urban livelihood, Socio-cultural pattern of life, income generation, Implementation of resources, ARMA Model

INTRODUCTION

In the decades to come, Tourism is likely to be a growing industry in India. It has tremendous potential for growth due to peoples' interest for travel and to explore nature and religious sites. Tourism in India is expected to play a key role in the country's economic growth, human resource, culture, wealth of the country in terms of foreign exchange earning, etc. Simultaneously, it has a direct bearing on local culture, socio-economic pattern of life, traditions, food habit, language, values & ethics of the local people due to frequent visits of national and international tourists in attractive tourist destinations. People love to visit tourist locations to have a flavor of pilgrimage, cultural heritage, and nature or even for getting away from the monotony of the routine life. People not only rejuvenate from these visits but also directly contribute for the growth of the local economy in terms of hospitality industry, handicraft industry and secondary occupation as tourists guide, carriers, etc. As per the estimate of World Travel & Tourism Council (WTTC), in 2002 travel, tourism and related activities were expected to contribute about 11% to world's GDP which is expected to increase to 12% by 2010 going to fall soon.. This industry is currently generating 7.8% of total workforce and this % is expected to rise to 8.6% by 2012. As per WTTC report of 2002, Tourism is expected to create more than 255 million jobs i.e. almost 10.7% of total global workforce. Much of this employment potential will be concerning with rural tourism where unemployment and lack of occupation are key issues for the local people and a major number of people live below poverty level. Rural tourism has remained neglected in India for variety of factors like lack of infrastructure, civic amenities, lack of publicity, and peoples' ignorance in accessibility to tourist location. As a result, tourists from home country and overseas countries prefer to visit urban tourist sites. Therefore, in India we observe that there is tourist congestion in urban, religious and historical sites and

simultaneously innumerable tourist sites remain unknown and unnoticed in the rural belts of our country. This paper has observed that a tourist site, which was, once located in extreme rural location has come to limelight due to its historical importance or publicity by the local government and they have developed into a tourist village with variety of improvements in civic amenities, road and rail connection, hospitality and cottage industry. This has in turn brought immense change in the local economy in terms of growth of handicraft industry, employment, life style of the local population, etc. Examples of rural tourism converting a rural belt into urban area are Ajanta, Ellora, Goa, etc. in India.

LITERATURE REVIEW

*Lewis, James B. (1998)*¹ et.al One of the most popular issues is rural community development and the use of tourism as a tool for that development. There is wealth of information about rural tourism including economic analysis of tourism, its impacts, and its affect on people. R.N. Kaul (1985)² points out that “one of the reasons for travel has been the desire to widen one’s knowledge & understanding about other peoples, place , & countries and study their culture, customs, ways of life & heritage & satisfy ones curiosity about them. Rajeev Kumar (2008)³ Rural tourism is a subset of tourism that would consist of wide range of aspect such as farm/agricultural tourism, cultural tourism, nature tourism, adventure tourism, and eco-tourism. Any form of tourism that displays the rural life, art, culture and heritage at rural locations, thereby benefiting the local community economically and socially as well as enabling interaction between the tourists and the locals for a more enriching tourism experience can be termed as rural tourism. Rural tourism is essentially an activity that takes place in the countryside.

Rural tourism is essentially an activity that takes place in the countryside. Rural tourism creates experiences for tourist who enjoys locations that are sparsely populated, it is predominantly in natural environment, and it meshes with seasonality and local events and is based on preservation of culture, heritage and traditions. Rural tourism has become quite admired since the last few years. According to Negi (1990)⁴ the attractions in rural areas Enjoyment of rural scenery, the desire for open space, quiet and piece of mind. Rural sports like hunting, fishing, ethnic attractions like folk life, custom, food, drinks, and festivals. Educational and historical attractions like castles, churches, temples etc. Respondents to an English Tourism Council ⁵ research project on rural tourism described the concept of rural tourism as ‘peace and quiet’, ‘slower pace of life’, ‘fresh air’, ‘non urbanised’ and ‘lots of space.’

This research also stated that rural tourism could encompass ‘gentle’ countryside (farms, fields, and cows), ‘rugged’ countryside (moors, hills, and mountains), coastal areas and non-urbanized towns and villages. Briedenhann & Wickens ⁶ represents that the benefit of tourism is that it is seen as a means of alternative development strategy for economic & social regeneration of rural areas, as a catalyst to stimulate economic growth, increased viability of underdeveloped regions & improve the standard of living of local communities. Hall and Jenkins (1998) ⁷ suggest that the expansion of tourist flows in rural areas: To sustain and create local incomes, employment and growth, to contribute to the costs of providing economic and social infrastructure, to encourage the development of other industrial sectors, to contribute to local resident amenities and services. To contribute to the conservation of environmental and cultural resources. Lane .B (1994)⁸ points out that “rural tourism should be –located at rural areas, functionally rural i.e. small scale enterprises, open space; natural contact, heritage, traditional, societal practices etc; rural in scale; traditional in character; take different forms representing the complex pattern of rural environment, tourists share in village life, and rural villages gain economic and other benefits from tourist activities. As per Annual Report of Ramakrishna Mission and Pallimangal Kamarpukur: 2006-2007¹⁰ tourism is more labour intensive than other sectors.

According to Chakraborty (2007)¹¹, Tourism services can increase employment, but businesses may target skilled labour elsewhere rather than train local labour from amongst the poor. According to Singh

(1994)¹² The interest of tourism and heritage conservation is complementary and thus tourism & culture become partners in the developmental process .

DATA & RESEARCH METHODOLOGY

This study is based on primary data and secondary data. For fulfillment, the objectives of this study observation method and survey method are the main technical tools. The survey instrument included questions on socio-economic aspect like age, sex, education, occupation. Information regarding on the profile of tourism industry included the tourism units (hotel, guesthouse) number of rooms, the number of persons employed, and area of belonging of the workers as well as the profile of tourists were the main elements of the survey. Rural Tourism Appraisal Model (RTAM) Philosophy was employed to evaluate the current situation using a SWOT analysis. The Sample size was restricted to 160 respondents and 60 respondents of 4 Stakeholders within the study area. The collected data has been analyzed using different statistical tools like percentage, ARMA Model for future prediction of tourist's inflow in the study area. Sources of secondary data collected were legal documents, official statistics, reports, articles, publications and other documents, reports of self-government bodies and organizations websites.

Context Of Kamarpukur

Kamarpukur is situated in the extreme west of Arambag Sub-division of Hoogly District, West Bengal in India with Bankura district in the west and South Midnapore in the north. It is surrounded by three rivers like Damodar, Kansabati and Darakeswar. Considering its geographical location and historical importance, Kamarpukur has taken a vital position in the road map of rural tourism in West Bengal. Although this tourist spot is of religious importance, it nature – lovers' paradise as if Jilimili, Susunia and Mukutmanipur are located in crow's flight from tourists' main destination of Kamarpukur. In other words, it may be said that the tourists visit Kamarpukur for religious purpose and thereafter cover the neighboring tourists locations in one go.

Demographic & Economic Profile:

As per 2001 Census Report, Kamarpukur is spread over of 190.30 sq. kilometers with total population of 143359 with 54380 people from backward community. Density of total population is 754 per sq. kilometers. Out of 190.30-kilometer area 14. 84 hectares are cultivable land. Therefore, local population cannot solely depend upon agriculture as the primary source of income. Therefore, a large number of populations depend upon secondary source of income through local tourism and handicraft industry catering to needs of the tourists.

Tourism Infrastructure Facilities

Local population lives in a religious atmosphere and in cultural heritage of Ramakrishna, Sarada Devi and Swami Vivekananda. The local people largely depend upon two festive viz. Ramakrishna's birthday, Durga puja celebrations when domestic tourists visit this site. In order to conserve rich Cultural and Spiritual heritage, Ramakrishna math undertakes activities like:

- i) The cultural performance by village folk viz. folk dance, Yatra performance, musical performance – these cultural performances not only entertains the local population but the domestic tourists who are interested to observe traditional village culture.
- ii) Lectures and discussions are organized in nearby villages regarding harmony of religion and for promotion of international brotherhood and elevation of spirituality in the community.

- iii) Mela at Kamarpukur establishes variety of temporary shops which are run by the people from neighboring villages who display and sale local handicrafts.

Ramakrishna, Sarada Devi and Swami Vivekananda influence much of the cultural life of local population during traditional Hindu festivals like Durga puja and Kali puja. The local population as well as domestic and international tourists visit Kamarpukur on these occasions not only to enjoy the religious activities in rural environment but also to have a taste of Cultural heritage of this tourist destination. This provides an opportunity to local people to display and sale their handiwork to the tourists with a view to earning their livelihood. In order to accommodate the tourists for their brief stay at Kamarpukur, Ramakrishna Mission runs two guesthouses. There are private hotels and restaurants at Kamarpukur who take care of large number of tourists. Because of seasonal tourism, local people get the scope to earn more through supply of food, providing transport facility and selling their handiwork to the tourists. The villagers of Kamarpukur, they are of opinion that tourism industry is an economic source is lucrative.

The local people during the festival of Sri Ramakrishna's birthday fair & during Durga puja earn cash a lot. Math takes initiatives every year during those celebrations. Tourism can also support local culture in rural areas by encouraging restoration of local and regional historic sites. In addition, tourism, which is generally considered a relatively clean industry, may foster local conservation efforts.

R. K. Mission has owns two guesthouses for Pilgrims who wishes to spend their spiritual holidays for few days. For accommodation in the guesthouses are requested to contact the Math Authority for booking. There are three, four and five bedded rooms with or without attached baths. Side by side, some private lodge, hotels and restaurant also build near by the math and around Kamarpukur when overcrowd at the time of celebration tourist stay such lodge cum hotels. An a impact of tourism it has been observed that tea stall, fast-food centre, rickshaw puller, STD shops, sweet shop owner etc are benefits due to tourist inflow and as a result they are able to earn a lot of cash from tourists. At the time of Prayer' both Kamarpukur Mission authorities provide tourist police for maintaining discipline. Van Rickshaw, Rickshaw and rental Car available for sight seen. Medical facilities also provide in the emergency case.

Table 1: Infrastructure at a Glance

Amenities	Kamarpukur (Nos.)
Guest House/Lodge	
a) Run by RK Mission	2
b) Private Entrepreneurs	8
Hotels	4
Food stalls	7

No. of Tourists	45,000(approx) during season & 10,000(approx) during off season
Car parking facility	Constructed by RK Mission
Children's Park	1

Source: Field survey method

Besides there are other facilities like Medical aid, medicine shops, laundry facility, banking services and Travel agents available to fulfill tourists' needs. With regard to tourism, Kamarpukur faced with two-fold problems. On the one hand due to lack of infra-structural facilities as indicated in the above table, tourists visiting the place during two particular occasions do not get adequate facilities for accommodation on the other hand, during the rest of the year due to lack of tourists, neither the Government, nor RK Mission or private investors are interested to develop boarding, lodging and other infra-structural facilities at Kamarpukur. This tourist location, despite having high potential, remains neglected most of the months of the year. Secondly, compared to availability of limited agricultural land and high density of population at Kamarpukur, as enumerated earlier, the population cannot depend on agriculture.

They need to explore their potential for handiwork, which has tremendous potential for growth if tourism is promoted and it becomes perennial in nature in this tourist location. It will certainly improve socio-economic pattern of life of local people of Kamarpukur. Tourism can offer rural residents business opportunities in activities that cater to the tourist trade. Brown M. Dennis¹³ Such locally operated businesses, which may be seasonal, can provide local residents with valuable opportunities to develop business skills and can give local crafters, farmers, and food processors, among others, outlets to sell their products to local retail establishments. As of date, majority population lives below poverty level (BPL). Paralelly we observe that handicraft of Kamarpukur and neighboring villages are very rich. As we observe that gradually the tourism activities are improving slowly, some rural development projects of "Ramakrishna Mission Pallimangal" are gathering momentum. The existing small-scale industries, which need to be nurtured with contact of rural tourism, can be mentioned below:

Jute Handicraft Unit: Since 2001 -02, Jute handicraft units producing about 35 jute items for domestic usages have come up in Pallimangal centre providing employment to 75 poor and destitute village women who earn in the range of Rs. 1000 – 1800 per month. Although the number of people and earning per head are both insignificant, but they are worth mentioning due to the effort on the part of non-governmental agency i.e. Ramakrishna Mission.

Weaving Project Unit: Women workers at Kamarpukur are doing handloom weaving and stitching of garments. Ramakrishna Mission has opened at Nakunda under Pallimangal Weaving Project in 2010 providing job opportunity to 33 poor and destitute women who earn in the range of Rs. 1000 – 5000 per head per month.

Incense Stick Unit: In 1980, the Pallimangal centre promoted this cottage industry, which provides self-employment to about 30 persons whose monthly income is in the range of Rs. 1000 – 2300 per head per month.

Mini Jute Spinning Unit: The Unit was established during the year 1987 as a pilot project in collaboration with Jute Technological Research Laboratories (Now NIRJAFT) Dept of Science & Technology Governmentt of India & Govt of West Bengal. Average earning of a worker is Rs 1267.00. This unit was under taken by pallimangal during its inception in 1980.

Food Processing Unit: Promoting Cottage industries with available resources, minimizing wastage of perishable fruits and Vegetable, helping the farming community Pallimangal started the Programme in the month of June 2002. Now 19 varieties of products are processed from different fruit and vegetables. Govt. of India, Ministry of Food Processing Industries Sponsored 3rd EDP training on food processing during the year.

There are also three units like Seed Production Units, Apiculture Unit and Solar Energy Units. The Community of Kamarpukur in well cultured and educated. Educational status in and around Kamarpukur in very rich. There is One Boy's School under R.K.M, One Girls' School, One Co-Ed. School and two

Colleges under The University of Burdwan at Kamarpukur. There are also 13 Non-Formal Education Centre (NFEC) (Three Coaching Centers for Primary School Students) for SC, ST and Depressed Classes. Medical Service is also rendered by the R.K.M for the poor and needy patients of the local and neighboring villages of Bankura, Medinipur & Burdwan districts. Eye Core Unit & National Blindness Control Program, National Tuberculosis Control Program, National Leprosy & Elimination Prom, Child Nutrition Program (Average 36 Children per day were provided with milk powder, Biscuits, Sweets), Regular Mobile, Medical Services at free of Cost is being continued since 1980 in and around Kamarpukur. Again more than 196 medicinal plants collected from different regions of the country are being cultivated and has been named 'Gadadhar Herbal Resource Garden' established in 2005-2006 to make people aware of the importance of cultivation of medical plants for the use of domestic health remedy.

Table: 2 Stakeholders

Classification of Stakeholders	What we can expect them to offer	Potential Influence	Description
The RK Mission	Human recourse, Organizing of funds Overseeing Activities	60 / 60	Their overall vision will drive the project
Local Community	Initial 'help' may be Minimal	37/60	Critical stakeholder - they stand to gain the maximum even if they cannot 'help', they have their ability to hinder
Local Government	They can play a crucial role in government sanctions	25/60	Their cooperation needed for safety & security; they can create issues if training programme not sustained long term
Tourist Pilgrims Dedicated tourists.	Regular , committed	48/60	Can be future source of sale of products; & encouraged to participate in community initiatives to create a 'corpus' of funds- for basic food & clothing.

FINDINGS OF THE STUDY

From the above data, the following findings clearly emerge.

Study on Respondents

A survey conducted on 160 respondents ascertains the contribution of tourism in the economic growth of Kamarpukur. 160 respondents considered revealing their awareness of the concept of rural tourism and spiritual tourism showed that 30% were familiar with the concept of rural tourism, 28% about spiritual tourism and the remaining 42% showed a keen interest to learn about both. (Figure: 1)

Out of 160 respondents considered, 70% were intra state tourists, 25% were inter state tourists, and 5% foreign tourists. (Figure: 2)

Majority of the 70% intra state tourists were from Kolkata, Howrah, Burdwan, Bankura, Midnapore, and 24 Parganas. With regard to the 25%, inter state tourists majority came from Mumbai, Kerala, Chennai and Orissa.

The 160 respondents in the study to find the frequency of tourist visits in Kamarpukur revealed that 48% had visited Kamarpukur for the first time, 22% had visited twice in a year, while the remaining 30% visited only in the festive seasons such as Durga Puja, Ramakrishna's birthday, and Kalpataru festival.(Figure:3)

The 160 respondents when segmented on the criteria of the purpose of visit revealed that 62% of retired persons visited for devotional purposes and for pollution free environment; 26% to enjoy the rural environment and because such visits proved economic; and the remaining 12% indulged in casual visit.

STUDY ON STAKEHOLDERS

A survey on possible community development with a sample size of 60 was conducted on four stakeholders, namely, Ramakrishna Mission, Local Community, Local Government, and Tourist Pilgrims. All the 60 respondents surveyed at Ramakrishna Mission were found to be involved in the effective utilization of rural human resource and organizing the available funds. 37 out of the 60 respondents in the local community showed a keen interest for direct involvement in community development. Out of the 60 respondents in the local government, 25 agreed to offer their full support to the safety and security of the community subject to government sanction of the requisite fund. 48 out of the 60 respondents of the tourist pilgrims were found to be regular dedicated visitors who directly participated in community building by rendering various services like one who was a doctor offered treatment to the sick while the teacher tutored. The community also economically benefits highly from the visits of these tourist pilgrims as the pilgrims indulge in lavish purchase of the local handicrafts

EMPIRICAL STUDY

On the basis past 48 months data, we are analyzing the future trend of tourist inflow in Kamarpukur. We apply a general time series regression model, which describes as:

$$Y_t = X_t\beta + \varepsilon_t \quad (1)$$

Where Y_t =tourist inflow, X_t = Year, ε_t = White noise, with zero mean and constant variance. We estimate the time series regression equations as follows:

Tourist Inflow:

$$y_t = 4140.79 + 85.54x_t \quad (2)$$

Based on the above time series regression equation we predict the future trend of tourist inflow in.

This is a basic time series regression model where we do not consider the random walk model as well as the stationary property of time series that is the problem of moving average and autoregressive problem. In order to avoid the problem of autoregressive and moving average we consider the ARMA (Autoregressive Moving Average) model for prediction of tourist inflow in Kamarpukur.

AR-model: $y_t = \rho y_{t-1} + \varepsilon_t$. It can be shown that

$$E(y_t) = 0; \quad V(y_t) = \frac{\sigma^2}{(1 - \rho^2)}; \quad \text{corr}(y_t, y_{t-k}) = \rho^k. \quad (3)$$

ARMA model:

$$y_t = \rho_1 y_{t-1} + \dots + \rho_p y_{t-p} + \varepsilon_t \quad (4)$$

We estimate the ARMA model for tourist inflow, where we apply $\rho = 1$ and $q = 0$ based on partial autocorrelation functions. Here x_t is the value of time. The estimate ARMA equation as follows:

Tourist inflow

$$y_t = 3140.79 + 82.54x_t + 0.43y_{t-1} \quad (5)$$

Based on Akaiki Information criteria and all t values for different regression parameter we can conclude that model is accepted and it can be used for predict the future trend based on past data.

Table 3: Residual

Number of residuals	48
Standard error	1430,0396
Log likelihood	-415,45199
AIC	836,90398

Table 4: Analysis of Variance

Figure 4: Partial Autocorrelation Functions of Tourist Inflow.

This figure shows that partial autocorrelation functions of tourist inflow.

All the above figures represent the future prediction of tourists' inflow at Kamarpukur up to 2014 on the basis of previous 48 months from 2006

Rural Tourism Appraisal Model (RTAM) Philosophy (SWOT)

S= Strengths

- Rich & Spectacular rural physical setting for rural tourism
- Rich quality of natural environment
- Rich History, Heritage, Handicraft
- Rich variety of festive occasion and celebration through out the year
- Maximum level of tourist satisfaction
- Good transportation

W= Weaknesses

- Kamarpukur is far from main Urban area
- Most of the cultural ritual demolished
- Lack of trained guide
- Lack of promotional strategy
- Low level of sanitation

O= Opportunities

- Increasing tourism allied activities
- Motivate more alternative employment and income generation
- Capturing floating tourist & increased number of stay
- Attracting attention foreign tourists
- Development of allied tourism direct involvement activities

T= Threats

- Saturation of local cultural heritage exposé
- Political disturbance
- Migrate / Shift another profession
- Increase land price

CONCLUSIONS

The Social significance of heritage lies in its association with identity: it is fundamental in helping individuals, communities. In and around of Kamarpukur of Hooghly district the custodian of religious heritage sites constitutes a key elements in defining their Socio Cultural identity. Interest in cultural heritage emerged as a tourist attraction during the 1990's and was embraced as an important economic asset and a mechanism to preserve ethnicity. History and its tangible markers in the form of buildings, Cemeteries, folk music, literature, Culture has quietly survived for centuries. Heritage is not history Heritage makes history come alive, a day spent at one of the historical sites is an educational experience for the tourist and a source of community revenue. The interest of tourism and heritage conservation is complementary and thus tourism & culture become partners in the developmental process . It can be said that rich traditions of religious tourism, India can emerge to be a promising destination for modern tourism. It has been found that tourists of Kamarpukur make a trip to Mukutmonipur at Bankura, Coastal Biosphere at Digha in Midnapur, Ajodya hills at Purulia District. As a result, Socio Economic life and auxiliary services becoming commercialized and this zone turns into Business Zone. Rural tourism is gaining importance in Indian tourism map with its economic and social benefits. It is estimated that Rs. 4, 300 crore additional revenue can be generated through Rural tourism. It is going to play a vital role in bridging the gap between Rural and Urban India by balancing urbanization and counter urbanization syndromes. Therefore we can reasonably argue that rural tourism in this part of West Bengal, having a rich cultural and religious heritage , will pave the way of sustainable development with women empowerment

ABSTRACT

This paper is intended to compliment research in which the ethical attitudes of undergraduate engineering students at St. Mary's University were examined. Students were given a survey that contained 20 questions and vignettes dealing with issues related to ethical and moral behavior. The scope of this study was to determine if existing ethics courses and gender would play a part in how these engineering students would assess ethical dilemmas. This same survey was given to engineering students from Universidad in Mexico. The purpose of this research was to examine how cultural differences weigh in on the perception of ethical issues between U.S. and Mexican students.

INTRODUCTION

As globalization continues to centralize the world economy, cross-cultural studies could help bridge the gap in understanding the ethical values practiced by various countries. Whitcomb, Erdener, and Li (1998) discussed how comparative management studies have noted significant differences in the work values of East Asian and Western cultures. The majority of these ethical studies have been concerned with business ethics. With the growing number of international contacts, comparative studies become increasingly essential for promoting mutual understanding and facilitating smoother and more constructive interactions (Lin, 1999). Studying the cultural influences on moral decision making could produce valuable information. Relying on set morals for the whole population could hinder the relationships that will need to be fostered to allow for the growth of these regions. Preble and Reichel (1988) noted that different moral practices may be the result of differing circumstances from culture to culture rather than differing moral principles. In the following sections, a summary of the relevant literature review is presented. The methodology is then described and followed by the research findings and analysis. Our final remarks are then presented.

LITERATURE REVIEW

The study of culture and decision making is a relatively new and unexplored field. Therefore, in trying to understand how one could be influenced by this, cross-cultural psychology could help to shed light on why this could be such a major decision factor. Hofstede (1980a) maintained that people carry "mental programs" that are developed and reinforced through their experience, and that these "mental programs" contain a component of national culture. Hofstede (1980b) concluded that these mental programs denote the existence of four underlying value dimensions along which these countries could be positioned into culture areas. These four dimensions are (Hofstede, 1980b, 1983, 1984, 1985):

1. power distance, i.e. the extent of power inequality among members of an organizational society;
2. uncertainty avoidance, i.e. the extent to which members of an organizational society feel threatened by and try to avoid future uncertainty or ambiguous situations;

3. individualism and collectivism, which describes the relationship between the individual and the collectivity that is reflected in the way people live together; and
4. masculinity and femininity, i.e. the extent of roles division between sexes to which people in a society put different emphasis on work goals and assertiveness as opposed to personal goals and nurturance.

These dimensions are based on four fundamental issues in human societies within which every society has to find particular answers. (Sohail and Saeed, 2002) The most popular and widely analyzed dimension of cultural values is individualism and collectivism (e.g., Hofstede, 2000; Kim, Triandis, Kagitcibasi, Choi, and Yoon, 1994). In an individualistic culture, the individual is detached from relationships and the community. While in a collectivist culture, the importance of relationships, roles and statuses within the social system are stressed. To give an example, according to several cross-cultural studies on individualism and collectivism, the United States is a country with more individualistic value orientations and Venezuela and India are countries with predominantly collectivist value orientations. (Guss, 2002) This being said, the likelihood that those cultural differences will play a major part in decision making is greater due to what is expected of an individual from that culture.

Several authors adhere to the manner in which individualistic and collectivist cultures appear to influence decision making. Ohbuchi, Fukushima, and Tedeschi (1999) studied the influence of cultural values on how people make decisions. They asked American (more individualistic) and Japanese (more collectivist) students to recall a conflict experience and to describe it. Results showed that more individualistic cultures (American) seemed to prefer more assertive tactics while the collectivist culture (Japanese) favored avoidance tactics. These groups also differed in the goals they meant to achieve. American students wanted to achieve justice and the Japanese students were more concerned with how this would affect relationships. The conclusion was that cultural identity could possibly play a major role in deciding an ethical decision.

In another study, students from three Western countries considered to be individualistic cultures and students from three East Asian countries considered to be collectivist cultures were given a questionnaire to measure decision-making style and confidence. (Mann, Radford, Burnett, Ford, Bond, Leung, Nakamura, Vaughan, and Yang, 1998) These students were asked to rate themselves from 0 to 12 under these qualities for each question that was asked. Results showed that students from individualistic cultures were more confident in their decision making abilities than their collectivist culture counterparts. The study also captured the aspect that Eastern cultures are not as likely to brag about making decisions or one's self, which could be the cause of the lack of confidence that was apparent in the study. It was suggested that a collectivist culture has to weigh in the opinions of those around. In cases dealing with East Asian cultures, what people think of someone's made decision weighs very heavily upon them, while the West seems to weigh more heavily on personnel gains.

Guss, Strohschneider and Halcour (2000) focused on how an individualistic culture (Germany) and a collectivist culture (India) would react when confronted with a dynamic situation. A computer simulation was set to analyze and compare not only the outcome of a decision but also the process of dynamic decision making. An analysis of the results showed that German decision making was more expansive risky, while Indian styles were considered more defensive incremental. There was no real correlation with the fact that these were individualistic and collectivist cultures. Most likely decisions were made based on the fact that the Indian market is not as stable and transparent as Germany's.

The aforementioned work only begins to explore the links between culture and ethical behavior. Studies such as comparing students from Malaysia and New Zealand (Goodwin and Goodwin, 1999) strongly suggested that culture is a major contributor to the ethical decision making and that it is likely to play a

key role in a globalized world. Having an insight into how cultural variables affect ethical perceptions could facilitate and enhance the interaction among different peoples in the world.

METHODOLOGY

This study and analysis of ethical behavior is a broadening of scope from graduate research at St. Mary's University. Past research has concentrated on the gender bias in ethical beliefs and if exposure to ethical training had any impact on beliefs (Garcia, Moras and Easwaran, 2008). The major objective of the present work was to examine the ethical beliefs of engineering students at St. Mary's University (U.S.) and compare them to the ethical beliefs of engineering students from Universidad in Mexico with the purpose of testing the hypothesis that culture affects the ethical perceptions of each group. One of the expectations of this study was that its findings would bring about theories that spark the need for further investigations.

The survey was administered during class periods at St. Mary's University (U.S.) and Universidad Regiomontana (Mexico). The sample body for this survey included 107 St. Mary's University engineering students and 162 Universidad Regiomontana engineering students.

The questionnaire included four background questions followed by 20 Likert- scale questions. Students were asked to specify their class, (Freshman, Sophomore, Junior, Senior), gender, engineering field of study and whether they had completed a university level ethics course. Gender and completion of an ethics course were not analyzed in this study. The main objective was to look for any answers that could raise the question of individualistic (U.S.) or collectivist (Mexico) cultural influence.

In the second section, the 20 questions were presented in which the respondents were asked to express their level of agreement with scenarios in which an ethical issue was raised. The students were prompted to rank their opinion according to the scale 1= strongly agree; 2= agree; 3= neutral; 4= disagree and 5= strongly disagree. Most of these scenarios involved engineering related topics. The goal was to measure the attitudes towards ethics of undergraduate engineering students from the sample at St. Mary's University (U.S.) which was used and the individualistic culture example and from the sample at Universidad of Mexico which would be used as the collectivist culture example. The survey was designed to provide quantitative data that could be used to develop a statistical analysis.

There have been studies on the proper ways to administer these surveys. (Richman et al., 1999) There was a chance that if these surveys were conducted face- to- face, information would not be as accurate. This is why the anonymous paper and pencil survey was chosen in hope that the most accurate information would be collected. St. Mary's professor, Dr. Rafael Moras and Universidad Regiomontana professor Rogelio Escamilla, administered and collected the anonymous paper and pencil based surveys used for this research. St. Mary's University professor, Dr. Gopalakrishnan Easwaran, developed the Access database used to input and analyze the results.

RESULTS

The analysis between St. Mary's University (U.S.) and Universidad Regiomontana was conducted to identify if there were differences in the responses of members in an individualistic culture (St. Mary's University) and a collectivist culture (Universidad Regiomontana). A *t*-test was conducted to determine if there were any significant differences in the analysis. The formulas used in this analysis are as follows:

$$T_{calc} = \frac{\bar{X}_{us} - \bar{X}_{mx}}{sp \sqrt{\frac{1}{N_{us}} + \frac{1}{N_{mx}}}}$$

Sp is solved for the following equation by:

$$Sp^2 = \frac{(N_{us} - 1)(SD_{us})^2 + (N_{mx} - 1)(SD_{mx})^2}{N_{us} + N_{mx} - 2}$$

Where SD = standard deviation.

A t - distribution was then used to test the hypothesis (using Microsoft Excel) at the 0.05 significance level.

The tabulated results of each question are provided in Table I. The responses to questions 1, 2, 6, 7, 8, 10, 11, 16, 18 and 19 were found to be significantly different. Question 1, “You are the engineering manager at Company A. You find out that Company B has had a technological breakthrough that will give them a significant competitive advantage. You are informed that the engineer in charge of Company B’s project is looking for a job. You feel it is alright to hire him with the intention of prompting him to reveal the details of the breakthrough.”, resulted in a p - value of 4.4E-10 (with a U.S. \bar{X} = 3.54, SD = 1.19 and MX \bar{X} = 2.56, SD = 1.22). Question 2, “As an entrepreneurial engineer, you have set up a store to sell your products. When customers pay cash you conveniently “forget” to give a receipt. Any income received this way is virtually tax free. While this practice is illegal, you feel this is acceptable behavior.”, resulted in a p - value of 2.0E-16 (with a U.S. \bar{X} = 4.5, SD = .75 and MX \bar{X} = 3.38, SD = 1.16).

Question 6, “You have a very low average in a course and your professor does not allow programming of formulas in calculators for exams. You know she will not check your calculator and more than likely you will not get caught if you use it. Therefore, it is acceptable behavior to consult formulas you programmed on your calculator for an exam.”, resulted in a p - value of 3.7E-9 (with a U.S. \bar{X} = 3.92, SD = 1.01 and MX \bar{X} = 3.02, SD = 1.28). Question 7, “Engineers are only responsible for products they design and manufacture, but not for the physical welfare of their customers.”, resulted in a p - value of .005 (with a U.S. \bar{X} = 4.25, SD = 1.0 and MX \bar{X} = 3.86, SD = 1.17).

Question 8, “The only ethical issue in engineering is to have economic success.”, resulted in a p - value of 7.4E-6 (with a U.S. \bar{X} = 4.35, SD = .73 and MX \bar{X} = 3.82, SD = 1.04). Question 10, “All engineers act ethically, regardless of whether they are aware of it.”, resulted in a p - value of 5.3E-8 (with a U.S. \bar{X} = 3.89, SD = .91 and MX \bar{X} = 3.185, SD = 1.08). Question 11, “Ethical values are irrelevant in the practice of engineering.”, resulted in a p - value of 2.4E-7 (with a U.S. \bar{X} = 4.495, SD = .85 and MX \bar{X} = 3.86, SD = 1.03). Question 16, “One of our most important customers has a young nephew who has applied for a position at our company.

We must give him preference over the other applicants because of our relationship with the customer.”, resulted in a p - value of .047 (with a U.S. \bar{X} = 3.988, SD = .99 and MX \bar{X} = 3.73, SD = 1.06). Question 18, “It is appropriate to blame my subordinates for my mistakes.”, resulted in a p - value of .001 (with a U.S. \bar{X} = 4.58, SD = .59 and MX \bar{X} = 4.24, SD = .95). The last question with a significant p - value was question 19, which was part of a vignette, “Given the financial situation of the company, Mr. Hampton’s decision is acceptable behavior.”, resulted in a p - value of .03 (with a U.S. \bar{X} = 4.31, SD = .79 and MX \bar{X} = 4.07, SD = .91). The fact that half the questions resulted in statistically significant differences should be considered an indication that:

1. when comparing Mexican and American undergraduate engineering students, culture appears to affect the perception of ethical issues;
2. further investigation should be conducted to further explore the causes of the differences.

Table: 1 (Cultural Analysis)

Question sequence by culture, Means, Standard Deviation, TDIST(p-value)							
Question No.	Culture	M	SD	Question No.	Culture	M	SD
Question 1	U.S.	3.54	1.19	Question 11	U.S.	4.495	0.85

CONCLUSION

The results in this research helped to validate the need for further analysis of how cultural influences can be a factor in decision making. Survey results suggest that the cultural background of engineering students appears to have a measurable impact on their ethical perception of some ethical issues. This trend should be investigated further. The majority of the significant differences were between neutral responses and disagreements. These differences could be theorized as marking a distinction between individualistic and collectivist cultures. As stated earlier, (Mann, Radford, Burnett, Ford, Bond, Leung, Nakamura, Vaughan, and Yang, 1998), individualistic cultures are more direct in their decision making allowing the U.S. sample in the survey to continuously disagree with the questions while the sample from Mexico decided to answer in neutral fashion. However, this could also be because of the knowledge base of the question, one group might understand a subject differently allowing for a definite response.

Additionally, answering neutral does not necessarily mean that a decision maker is unethical. In general, both populations could be considered ethical. The one question that did foster interest was question 1, “Hiring a former competitor with the intention of prompting him to reveal details of a technological breakthrough.” The sample from Mexico ($\bar{X} = 2.56$) tended to agree with the question while the U.S. sample ($\bar{X} = 3.54$) was neutral. From the survey stand point, this question was unethical. But from a collectivist stand point this question allows information to be exchanged amongst people. Swapping ideas is how information is passed. Maybe to a collectivist culture this would not be unethical.

These results should also be taken into account that between 60 and 75% of St. Mary's student body claims to be of Hispanic heritage. Would this mean that conducting a similar survey at another U.S. institution with a different racial background yield different results. There is also the question if Universidad Regiomontana represents an entire Latin American population. This could be one reason why it is very difficult to assess culturally influenced decision making in multi-cultural environments. However, this does deem it necessary for more research.

An analysis of the statistical results does not permit to draw a definite conclusion on whether culture influences ethical decision making. It does however, continue to fuel debate over the cultural impact. Certainly continuing to study the four value dimensions (Hofstede, 1980b, 1983, 1984, 1985) could provide valuable information in determining the cultural factors that influence decision making. Understanding these influences will certainly help as we strive for globalization.

REVISITING THE RELATIONSHIP BETWEEN OPTION EXPENSING AND STOCK RETURNS

Rogelio J. Cardona, University of Puerto Rico-Río Piedras

ABSTRACT

In 2002, the Financial Accounting Standards Board allowed corporations to recognize stock options as an expense on their financial statements on a voluntary basis. Option expensing became mandatory in 2004. This investigation uses two different models to reexamine the effects of the announcement of the voluntary expensing of stock options (when expensing was not mandatory) on the abnormal stock returns for a group of firms. We find that, as expected, investors prefer firms that initiated expensing stock options to firms that did not announce they were going to expense them. However, when we compared the stock returns of the announcing firms with the Market's expectations we found opposite results. This discrepancy suggests that announcing firms possess certain attributes that differentiate them from the firms included in the Market model. The required expensing of stock options has not eliminated their controversial nature. After investigating the different effects of expensing options, future research efforts should move towards trying to understand how these effects are transmitted to the market. If analysts are in effect ignoring stock-option expense in their earnings forecasts, as suggested by Barth, Gow and Taylor (2009), then the controversy over the reporting of stock options has only just begun.

FINANCIAL LITERACY IN REMITTANCE-RECEIVING HOUSEHOLDS

Marisol Cen Caamal, Universidad Anáhuac Mayab

ABSTRACT

A survey carried out in Tunkás, a migrant-sending community in rural Yucatán shows the composition of incomes and consumption patterns in remittance-receiving households. The survey obtained information from each household, and findings indicate that besides remittances, government social assistance programs are the main source of household incomes. Evidence shows that a high percentage of remittance-receiving households do not perceive the importance of savings or investment and focus entirely on consumption. And what is most worrying is that almost 50% of households contract debts on which they pay high interest rates. In most cases, these debts are used to finance more consumption, to pay health care expenses or to pay off other debts. Remittances are not having a significant positive impact in this community, and it seems that things will not improve if the people of this community do not receive financial education. They need to learn how to maximize the financial resources they have and to be aware that remittances can be assets to create new incomes for their households and to improve their quality of life.

E-BUSINESS MODELS AS A TOOL TO INCREASE SME's SALES IN MÉXICO

Yessica Helgueros, Universidad Tec Milenio

ABSTRACT

Due to the growing incursion of the electronic media in the commercial environment, searching for factors that would favor the competitiveness and the necessity of ready and timely information that allows taking decisions, as well as using the time and resources more effectively; business models based on information and communication technologies, known as e-business models, have been developed. This study consists of the exploration of 189 web pages of organizations and the revision of bibliographical material and research material. The aim is to recognize the business models that the organizations use and to make a description of them; on the other hand, a compilation of data related to the amount of sales of the e-commerce B2C of 84 SMEs established in Mexico was carried out, as well as the results of sales by sector, the geographical distribution of the sales on the Internet. The goal of this is to recognize the increase that the sales via Internet of the SMEs of México have experienced. The results of the research demonstrate that both the imports and the exports are increasing, new markets are emerging and the confidence of the Mexican market is consolidating. In consequence, the economic development and growth of the country are improving.

KEYWORDS: Business models, e-commerce, e-business, electronic business

JEL: 030, O54

INTRODUCTION

The incursion of the Internet to the enterprise sector has transformed the course of the commercial relations of Mexico with the world, as the information and communication technologies represent a tool for the purchase and sale of goods and/or services that overcome the geographical barriers and barriers related to time and human or financial resources, in addition to bringing about more direct relations with the suppliers, clients and investors, including also the competitors. Before the global economic crisis, Mexico faced various problems, among them decrease in economic activity due to the cease in the activities of the purchase and sale of goods and services. According to the Summary of Indicators of the Department of Estate and Public Credit (2009), for the first six months of 2009, the trade balance was in accumulated deficit of 1,207 millions of dollars, which is why the value of the exported goods was 19,364 millions of dollars in June this year, which is 26.6% lower than the year before.

With the arrival of the current economic crisis, the struggle to obtain a competitive advantage over the others is becoming harder all the time, the clients and consumers have the freedom to choose the most satisfying supplier, as some of the factors to be successful in this difficult global market are to have quality products, to provide response in lesser time and a competitive price. The internet has offered tools that ease the barriers of time and the distance disappears, and it also offers a series of advantages like the expansion and diversification of the global markets.

The organizations are seeking to develop new business models on the Internet, as the Internet is already considered as new line of sales, displacing other forms of trade; therefore PROFECO (2006) considers electronic sales as an alternative to reducing costs and a fundamental tool in increasing the sales for the country to boost the economic activities towards an economic growth and development to resist the global crisis.

The rest of the study is organized in a following manner. In the literary revision, the relevant literature, such as basic concepts of electronic commerce, its regulatory framework and basic concepts of e-business models, are presented. In the methodology section, the method used to achieve the goal of this study is introduced. In the results section, the information demonstrated by the investigation that was carried out is presented and analyzed to formulate the conclusions.

LITERARY REVIEW

Jeffrey Reyport (2005) defined the term e-commerce as the “exchanges mediated by the technology between several parties (individuals, organizations or both), as well as the electronic activities inside and between organization that facilitate these exchanges”.

The advantages of the commerce on the Internet are: From the companies' point of view: It allows reducing the costs, the companies will have access to the global market; it also allows the integration of different resources (multimedia), as well as the diversification of the products offered, as well as the reduction of costs of sales, it allows maintaining direct contact with the client and to reduce the costs of distribution, the retailers can use the net to indicate the traditional wholesale or retail points of sale, it encourages the autosegmentation and the autopositioning in the market, it saves in the publicity costs, it is possible to gain additional incomes by selling advertisements or by designing web pages, and also it is available 365 days of the year and 24 hours a day.

From the consumer's point of view: The consumer can find ample information about the product she or he is interested in, as well as compare the alternatives that different companies offer and make a better and a more convenient decision, this way broadening the possibilities of choice.

The disadvantages of electronic commerce are: In Mexico, many people do not have access to Internet yet; it requires a communication infrastructure that is not yet available in all the countries; the costs of Internet are different in every country, which is the reason for differences in infrastructure between countries; there is still mistrust to use this medium for purchasing because it is open for deception, the connections lack quality, it does not facilitate the search of the needed product for all the people, there is a strong interference by the hackers in the web sites and frauds are committed.

Business to Consumer (B2C): an important category of the e-commerce: This kind of business to the customer is about the interchange between companies and final consumers, it means, traditional business through electronic ways. This business was the main initial development where e-mail is used in order to substitute catalog business, this mean there is a cost reduction because the vendor do not invest on producing, printing and shipping cost. There are two more main reasons to get success on this business: First is cost reduction and the second one is that everyone who owns a computer with Internet access could be tempted to realize purchase by this way. There are more probabilities to purchase software, videos, photos and music.

E-business models: Delta advisor's article “business model”, establish that “a business model is the mechanism by which a business try to generate incomes and benefits. It is a summary about how a company plans its client's services. Imply the strategy concept and the implementation.

The same way, it says that business model is the way to interact with the clients where it has to specify who is the client and the way to cover market, why it is attracted, how it is supported, which is the strategy for mixing products and sale that structure to guaranty the actual customer fidelity and the fidelity of new ones.

The client definition allows to be focused on the activity effort that really allow add value to the customer and do not take it as unnecessary purchase.

About Rappa (2005), “In the most basic sense, a model is the method to do business by which the company can be maintained, this is to generate incomes. The business model talks about how the company makes money specifying the place on the chain value”.

Functions to be comply a Mexican business model: According to Chesbrough and Rosenbloom (2001), the specifications for a complete and actual market are:

- Articulate the value proposition, ie the value created to users of the product model (good and / or service) offered using technology.
- Identify a market segment, for those users the use of technology should be useful and the company should earn money by offering the same.
- Define the structure of the value chain that the company needs to create and distribute your product and determine the complementary assets needed to support the position of the company.
- Estimate the cost structure and potential benefits to offer its product, taking into account the value proposition and the structure of the chosen value chain.
- Describe the position of the company within the value system, linking suppliers and customers.
- Formulate the competitive strategy through which the innovative firm will be more competitive and sustainable advantage.

METODOLOGY

In agreement with Rappa (2005), for the creation of a business model it is important to consider a series of factors from creation to implementation. This investigation was based on the following factors using the web pages in the list that follows afterwards.

- How to select clients.
- How to define and differentiate product offers.
- How to create utility for clients.
- How to get and conserve clients.
- How to launch to the market (Publicity strategy and distribution).
- How to define the activities to be executed.
- How to configure the resources.
- How to get the benefit.

The types of investigation that will be carried out in this section are the applied one, exploratory and the conclusive one. First it is realised because specific questions will be able to be determined about the problem. In second, an exploratory investigation in Internet with the intention of finding solution of the assumptions raised about the problematic one will be carried out.

The following information was obtained from a study by the Mexican Association of Internet in 2008 using 188 of its members. This study used questionnaires of 84 companies that use websites to sell products on the Internet. The results include sales, percent of sales using the internet, product categories, and services.

Since sales using the internet are relatively new and increasing in size, it is necessary to analyze if it is an effective way to increase sales.

Companies that sell in a traditional way can be faced with the challenge of defining their presence and reach in a virtual market. They need to determine when and how to use it. The presence of an electronic marketplace that provides rapid access to information that buyers and sellers can use to make decisions and become more efficient, new models of businesses based on the Internet have been developed. The data that follows comes from a study of electronic commerce in Mexico AMIPCI (2009). AMIPCI was founded in 1999 with the mission to build an internet based economy in Mexico.

The sectors included in the study include tourism and travel, department stores, entertainment, virtual businesses, and businesses with specialized products.

RESULTS

Thanks to the development of electronic commerce, new forms have arisen to sell tangible goods as well as intangible goods, reducing costs and barriers.

Brokerage Model: The brokerage model connects sellers and buyers. The “broker” who operates the site, facilitates the transactions, and usually receives a commission for each sale. The following types of markets can be identified: *Vertical markets B2C (B2C or buy/Sell fulfillment)* involve intermediaries who maintain and manage information, reducing costs to consumers. *Vertical markets B2C (B2B or Market Exchange)* consist of the intermediation between companies. *Business trading Communities* are sites that collect data provide contact between the agents of a business sector. *Purchase groups (Buyer Aggregator)* aggregate buyers that have an interest in the same product, concentrating the demand in order to obtain better conditions of sale from the supplier. *Distributors (Distributing)* publish on line catalogues of products. *Virtual commercial centers (Virtual Mall)* are collections of electronic stores under the same distributor enriched with means of common and guaranteed payment. Usually they become a market for the industry when they specialize in a sector. These web pages can include forums of discussion, closed groups of users, etc. Members of e-malls have reduce their costs of presence in the Internet, and payments and traffic can be generated from other virtual stores. The *metamediaries (Metamediary)* are virtual commercial centers which managed transactions and guarantee payments, protecting consumer and reporting satisfaction with salesman. *Auction Brokers* supply all types of products for sale, the sellers can be either particulars or companies. *Inverted auction (Reserve Auction)* sites, consists of an intermediary who negotiates the sale of a product or service as the buyer that fixes the price, later the salesmen realize their supplies adjusting to the predefined conditions. The *classified ones (Classifiends)* are ready of items corresponding to the supply or demand of products. The quota of the intermediary usually pays attention by announcement, more not by transaction. *Search agents* locate products or services that are being offered for the best price. The software that drives these sites searches through data bases and contains algorithms to account for variation in the description of products in different databases. These services may also create personal pages so that buyers can see information on what interests them, and can create links between people with common interests, often sending them electronic mail to alert them of changes in product availability.

Publicity on-line (Advertising Model): It consist in a web site that shows you payments and no payments contents to tangibles and intangibles goods, services associated for example the e-mail, publicity messages by mean of banners and blogs. Some examples are: *Generalized Portal*, which is a site that receives the user at the moment that gets access to internet. This site is financed by announcement and sponsorships. *Specialized Portal*, is the same concept than General portal, but it is more specialized as indicated in the name, and is focused to restricted audience cause of the specific topics. Thanks to the feature, it is going to allow realizing better publicity segmentation, consequently the cost increase in this site than the first option. The *Incentive marketing (Attention marketing)*, this model get in contact with announcers and consumers, the clients perceive an economic compensation by visualization on web pages, formulary complementation, opinion formulation, etc.. *Free model*, consist on a Web site that

offers to the clients different free services. *Bargain Discounter*, consist on the organization sells the model in a cost price, moreover its benefits is through the publicity to do in the site.

Informediaries (Informediary Model):_This model consist on the companies that give free Internet services with the finality to obtain users information, it means, to know what pages they visit, what they purchase, etc., and posteriori to process the information to be useful on other organizations to take decisions. There are two kinds of informediaries: first one, the recommender system, which is a site to facilitate the users some information about quality of determined products and/or services, giving advice about purchasing and can facilitate the application to interchange of purchase experiences between them and secondly the resgistration model, it is a service with free content which the access allow after preview inscription (formularies with personal and professional data from users), with obtained information the company create a data base which is exploited commercially.

Merchant Model: This model works as a complement of traditional business, this project is based uniquely on Internet (cybertraders). In this business model the incomes comes from the sale of products and services, moreover it have different kinds: The *Virtual merchant*, the companies that only work with Internet. The *Catalog Merchant*, the companies that sell person to person by mean of a catalog where shows their product and services and changed show their catalog on-line to get massive client with internet service. The *vendor on-off (Surf-and-Turf)*, which is the way that companies use by traditional models and decide sell by Internet. The *Vendor Bit*, about Del Águila (2001) “ it is about companies that commercialize digital products (for example electronic magazines) and services. The sales and distribution is through web...”

Productor (Manufacturer Model): Products of goods and services, sell by this way with the finality to reduce or eliminate distribution channels so that the product and/or service arrives to the client with a more economic price and the contact will be direct between the producer and the consumer which will be beneficial for both, the same way in the cases of complains of the product or services and improve the system.

Affiliation (Affiliate Model):_The organizations on this model develop a member net that supply market point to the vendor that develop the model, in this way if a potential client get into the vendor page through a member and make a purchase, this will perceive an income percentage, in an opposite case it won represent any cost.

Community Model: The attractiveness of this model is based on the users loyalty due to this people invest their time and economic resources in the proyect and can be identify two kinds: *Voluntary Contributor Model*, which Águila (2001) defines as “ Users community that sponsor a site through voluntary donations”. The *Knowledge Networks*, according to Del Aguila, it is like “ in this case, the users are experts in determinate subjects (company directors, professionals, etc.) the function of the new is to solve dudes and problems about this topics without get any payment.

Suscription Model:_Consist on incomes obtaining by access, contents and bye connection time. Some sites combine the free model with the subscription model which it allow the clients to get mayor access information.

Utilily or no-demand:_According Michael Rappa (2005) the utility model o under request is based on the measured use and the immediate payment method. The difference with the subscription model, is that the measured use are based on the real rates. Traditionally, the measurement has been used by basic services like electricity services, water and long distance calls.

Second part- Totals sales: The amount of sales of electronic commerce based on Internet are: In 2006, the sales made by this method gave a total of \$ 537 million dollars, in 2007 from \$ 955 million dollars, and in 2008, a total of \$1,768 million dollars.

Sales areas: The sales were recorded in three areas: International, inside the republic, and metropolitan. In 2006, the sales conducted in the metropolitan area, are picking up significantly (61%), followed by the sales of inside the republic (35%), and the foreign sales involving the little fraction (4%), but that can be developed.

In 2007, the sales conducted in the metropolitan area decreased (51%), but still picking up principally, followed for inside the republic sales, which increased (44%), and the foreign sales to continue to participate despite with the smallest part (5%), also registered an increase.

In 2008, are changes in the metropolitan area sales which felt down the level to the second position (36%); the inside republic sales increased significantly making position in the first place (50%), and the foreign sales despite continued involvement with the smallest part, also registered a very substantial increase of 3 to 1 approximately (14%).

The sales for consump belongings are represented by cell phones, electronics and audio products, pets, vehicles, clothes, watches, sunglasses, tickets, computers and accessories, etc., in 2006 represented \$183 million dollars, and in 2007, \$ 267 million dollars, and finally in 2008, \$ 389 million dollars.

The tourism sales include airline tickets, hotel nights, travel packages, among others, in 2006 represented \$354 million dollars, and in 2007, \$ 688 million dollars, and finally in 2008, \$ 1,379 million dollars.

People'S Confidence To Buy On-Line.

According to research by AMIPCI (2009), the level of people's confidence is positive, and 55% claim to have a lot confidence, while 39% are indifferent, that means, the people don't trust, don't distrust; the 6% have a lot or a lot distrust.

CONCLUSION

Interactive sites for commercial transactions provided by the Internet, are critical for development and growth of organizations in this globalized world where the flow of information needs to be made more quickly and effectively through new Internet business models.

The business models are so dynamic that are considered as an area that can no longer intact due to the constant evolution and adaptation to which subjects are many organizations, especially those based on evolving technologies.

According to statistics, domestic and international sales on the Internet are increasing, covering new markets and new territories, aimed at obtaining profits for SMEs and especially an increase in revenue to improve the Mexican economy, despite organizations face regarding the threat that people are still considered unsafe to conduct transactions through virtual means.

The amounts of sales by e-business models, were very attractive, which shows that further developed and implemented as an everyday practice in SMEs, may be of benefit such that it transcends all forms of traditional business turning them more strategic and innovative.

In conclusion it is recommended to SMEs investing in training to learn how to implement new electronic business models, as well as being profitable, it helps to increase sales, the development of both the organization and its business portfolio, contributing and economic growth in Mexico, as families increase their purchasing power and the economic cycle will activate in the fact that they consume products companies, and they earn income which in turn allow them to maintain employment. Additionally, this kind of business is very generous and flexible, because the people don't need a very hard quantity money for began their own business, they don't need spend a lot of money for an office rent and their equipment, all this represent a great opportunity to be your own boss and generate more jobs, and contribute to the country's economy. In the regional, national and international market, we can found and excellent way for the freight interchange which produces income for the country, a proof of this, is the statistics about the increase of sales by e-commerce in México.

To follow up this work, we propose as a topic for future research, creating new models for social and labor, because there is a strong need to generate employment in countries where there have been disasters, and infrastructure is devastated and also working on creating a malicious program on a culture of caring for the environment.

USUMACINTA CANYON STATE PARK, A SOCIAL TOURIST ALTERNATIVE

Manuela del S. Camacho Gómez, Universidad Juárez Autónoma de Tabasco
Cecilia García-Muñoz Aparicio, Universidad Juárez Autónoma de Tabasco
María del Carmen Ancona Alcocer, Universidad Juárez Autónoma de Tabasco

ABSTRACT

Alternative Tourism is a relevant income source for Mexico. There are countless potential sites in the Southeast as the Usumacinta Canyon State Park, in Boca del Cerro, located in the municipality of Tenosique, which is surrounded by native groups: Totzil, Chol, Maya and Zoque cultures. If tourist projects were developed in this zone, many benefits and employment sources could be created for the people in the community. The general objective of this research is to carry out an overall diagnostic of the socioeconomic conditions and the nature of the region in order to determine the ideal sites and the strategies to be implemented for the tourist development of the Usumacinta Canyon. This is a quantitative case, it was carried out through the analysis of specialized data and a wide field work, which included physical inspections, natural spaces classification, together with social capital inventories, tourist equipment and 409 surveys which were applied to tourists, communities, CEO's and executives of the area. The results from the research form a set of scientific, technical, administrative and marketing lines, which are useful for decision making in the tourist development of the region.

KEY WORDS: Usumacinta Canyon State Park, ecotourism, social marketing.

INTRODUCTION

Ecotourism is an activity which has been consolidating in recent years. This service is not regarded as the trips made by people whose main purpose is interaction, knowledge, contemplation, and preservation of nature. This kind of tourism tends to be carried out in an area that is not populated by people and it usually includes experimental, comprehensive and cultural activities to encourage environment awareness.

Ecotourism has raised special relevance since it has a close relation with our cultural heritage, and the intention to take care of nature and protected areas. It also has a social impact on vulnerable groups who usually live in these places.

Not only are tourist activities regarded as a great commitment and responsibility with the environment and the society, from the ecological point of view, but they are also considered an economical source which provides work benefits and social development for the people involved in tourist projects. We can quote in this context, the declaration of Quebec which gathered several groups; among these, were private enterprises devoted to Ecotourism, as well as academic and government institutions, native communities and local people, all of them coming from 132 countries. The statement which emerged from this reunion emphasizes tourism as one of the most important sectors in world economy and does not only recognize its contribution to poverty, but also to environment protection of endangered ecosystems.

Ecotourism is based on sustainable tourism principles in social, economic and environmental terms. However, its main difference is its contribution to the preservation of our cultural and natural heritage, the inclusion of local and native communities in its planning, development and operation, contributing in this way to social wellbeing. Likewise it encourages the interpretation of the cultural and natural heritage of the destination by the visitors, and it pays special attention to independent travelers and small group tours.

Quebec's summit recognizes the cultural diversity especially due to the presence of native communities which have preserved their customs and traditional practices, and in many cases have shown to be sustainable for many years. These protected zones are rich in cultural biodiversity and culture, and they are home of people who often live in poverty and lack of all minimal services such as health, education, communications and a suitable infrastructure that would enable them to develop within their communities. As a result, ecotourism can represent an alternative for an income source for local and native populations and their culture, and it will also help with the preservation and sustainability of natural resources. This is the case of the Usumacinta Canyon State Park, located in Tenosique, Tabasco in the Southeast of Mexico. (OIT 2006).

Tourism Background

Tourism has always been present as part of the lifestyle of all citizens in the world. The term Tourism as Amaya (2006) states can have several meanings in different cultures. In English speaking countries the terms "travel industry" and "accommodation industry" are used instead of the term "tourism". In Mexico, this term covers all these meanings. In these foreign countries the term refers it mostly as pleasure trips, but in the United States a business trip is not considered tourism; on the contrary in Mexico, it is called business tourism.

Alvarez & Espinosa (2008) confirms that tourism constitutes one of the fastest economical sectors of growth in the world and it has promoted a new tourist trend which has nature as a destination and it has consolidated the international demand for products with these characteristics; this has clearly remarked the promotion of different forms of this kind of tourism, many of which have been developed in protected areas.

There has been tourist activity all the times, but it is a fact that they have evolved. Seguí (2006) talks about a new science at the beginning of the XX century: "Touristology" especially from the AMFORTH (World Association of Tourist and Hotel Formation) which presents it as a need to analyze tourism from all points of view, including the multidisciplinary aspect which has characterized it.

Alvarez & Espinosa (2008) state that the autochthonous culture of each territory is the result of human nature, where the social being does not only create objects which allow him the satisfaction of material needs, but also a constant reproduction of enriching and diversifying social relations.

Sustainable Tourism

World trends show a clear interest for the services area, which along with merchandise are the axis of consumption markets, together with job markets. This means that these trends are looking for a balance between commercial and social markets through sustainability.

According to Alvarez & Espinosa (2008) tourism has generated a new culture where there is a rising environmental concern which has been determinant in the birth of a new tourist trend which has nature as its destination, and it is consolidating the international demand for tourist products with these characteristics. The impulse that has been given to these kinds of tourism is clear, many of which have been developed around protected areas.

In the same sense, Fennell (2002) has stated that the term sustainable tourism leads to the application of principles for sustainable development in tourism. According to this, Salido et al (2009) mention that there are several definitions and perspectives for sustainable tourism. This term has evolved transforming itself into a framework to understand how future tourist growth can be handled in the best way.

Among these perspectives, we should consider the proposal from Bringas & Israel (2004) who say that the idea of sustainable development is going through a crucial point in the tourist activity, because besides sun and beach, there are new ways for doing tourism, ways from which we can take advantage of natural and cultural sources in a sustainable way. These new ways have been named “alternative tourism”.

It is the purpose of this speech to adopt Sustainable Tourist Development (STD) as the one promoting a tourist development balancing and encouraging social equity, natural sustainability, and investment profitability with the objective of satisfying the current needs of the hosting regions, tourist investors, tourist service providers and tourists, in order to protect, strengthen and guarantee the opportunities for development in the future. (SECTUR/SEMARNAT, 2004:12, cited by Salido et al, 2009)

Tourism Background In Tabasco

Tabasco's territory seems to have been the transit hall for several migrations due to its geographical position; it was the commercial border between two great worlds of the Precolombine Mexico: the Mayas and the Aztecs. From very remote times, the abundance of water and natural resources have made of Tabasco, a suitable land for human settlements. Towards the year 1500 B.C. one of the oldest Mesoamerican civilizations flourished in these lands: the Olmecs. Afterwards, the Zoques, who seemed to be their most possible descendants who settled all along the state. Later on, the Mayas dominated the zone by founding countless cities. The settlements which have remained in Comalcalco, Pomoná and Reforma are a testimony of that. The Aztecs founded another town in the south of the state: Cupilco.

Even though alternative tourism has not been developed, the state is one of the richest in flora and fauna diversity, besides it counts on a great cultural potential because of its ancient history, as the birthplace of the Olmec culture in the Mexican Southeast. The government divides the state in two big regions: the Usumacinta region and the Grijalva region (named after one of the main rivers of the city), which is subdivided in five more regions according to their natural characteristics and location: The Central Region, The Chontalpa Region, The Marshes Region and the Mountain Range Region.

Ecotourism Markets

Ecotourism is directed to consumer services or users whose main purpose is interaction, knowledge and nature contemplation as well as participation on the preservation of the region. It is carried out in less populated areas and includes understanding and cultural awareness. (CESTUR, 2001).

In this sense, Hernandez & Gunhill (2006) indicate that environmental and sociocultural characteristics are relevant factors for local identity, and more frequently tourist activity transforms into a real problem that does not consider the ecosystems' fragility nor promotes the wellbeing of local inhabitants.

Tourism is considered an economical engine, but also a source of environmental deterioration. San Martín & Salcedo (2007) state that this activity has an important impact on social relations from the places where it is practiced as in the visitors countries of origin.

That is why a tourist product which leads this segment will require the development of a strategic plan, which includes places and attractive activities for the group of buyers, infrastructure, tourist service providers, and a good hosting level from the locals. Among the main activities considered to create an ecotourism product are the observation of the ecosystem, the flora (orchids and cactus plants) fossils and geological observation. These activities are feasible in communities surrounding the Usumacinta Canyon.

According to the data published by SECTUR (2006) the market segment where tourist activities efforts are heading is the national and international market. In this last one, the United States represents 71% of the tourists in the ecotourism market.

Regarding the tourists age we can observe that the national segment is very young, between 25-34 years old (39.6%) meanwhile the international one shows older ages, between 35-49 years old (30.9%). Both groups have university degrees (70 and 80% respectively) (CESTUR, 2006).

Referring to the affordability for buying from national tourists, we found out that the ones who travel with ecotourism purposes; earn more than \$40,000 pesos a month, equivalent to \$43,636 USD annually (CESTUR, 2006).

According to SECTUR (2001) the value of a formal demand of ecotourism activities and adventure tourism exceeds \$750 million pesos. The activities most likely to grow are: ecosystems observation, snorkeling, rivers descent, walking and mountain cycling. From all these activities, the majority of the above are very likely to be implemented at the Usumacinta Canyon.

The segments in these services have a very precise profile. The inclusion of these ecotourism segments is possible due to the wide range of activities which can be implemented, besides the biological diversity and various sites; and the enterprises which offer related services. (SECTUR, 001).

SOCIAL MARKETING

The applicability of social marketing to alternative tourism can bring out a direct or indirect benefit from all the parts which intervene in the exchange process that includes buyers, sellers and society all together. Social marketing pretends to determine and satisfy the needs and wishes of the target market, it also intends to provide wellbeing for the society through the health care of consumers and the preservation of the environment. Therefore, by implementing social markets, the result will lead to the increase of opportunities in short, mid and long term for companies, by gaining profits or benefits. (CESTUR, 2006).

Seven elements should be considered for the effectiveness of social market strategies in alternative tourism: 1) each member of the company or the organization has to be aware of this; 2) identify and satisfy the needs and wishes of the target market, 3) the conceptualization of products or services that increase or preserve the wellbeing of customers and society, 4) look for providers that identify themselves with the social market concept, 5) meet in effect laws or standards, 6) avoid that the product or service damage customers' health and 7) generate expectations that can be met or improved and not to lie about the competition (Thompson, 2006).

With regards to alternative tourism, the goal is to understand the consumer's needs as the backbone of commercialization strategies (Vera, 2003). For this reason the constant monitoring and the approach to the customer will require a huge effort from the institutions and companies which provide the service, in order to provide a new level of creation of value and be able to differentiate their offer to other destinations. Then the approach leads to the transference of full experiences to their clients, since they are buying promises and gaining skills when they buy and consume their products and services. (Araujo y Clemenza, 2005).

METHODOLOGY

The general objective of this work was to carry out a research about the social and economical conditions of the region where the Usumacinta Canyon State Park is located likewise establishing natural resources characteristics and inherent natural conditions to determine the right places for tourist development and to

offer strategies and planning to impulse the economical activity in the study area. This was in order to strengthen the tourist competition of the place, looking for some congruence with the profiles, needs and local opportunities for the development, operation and commercialization of the tourist offer in the state.

In order to determine the tourist potential of the Usumacinta Canyon State Park, the economical needs and the possibilities for development of the communities in the municipality of Tenosique, Tabasco, it should be taken into account the contribution of the Tourism State Program, which in section IV is named: "Towards a sustainable and competitive model for Tabasco's tourist development" based on federal policies.

The tourist diagnosis of the Usumacinta Canyon State Park (in *Boca del Cerro*) considered the perception of the inhabitants of nearby communities, together with the groups weaknesses and strengths regarding the possibility of tourist development in that geographical area. After doing a physical inspection of 27 communities, 6 were chosen as the most representatives in terms of population or potential tourist development : *Sueños de Oro, Redención del Campesino, Hidalgo, San Francisco, Corregidora and Santo Tomás* (see figure no. 1).

According to the results derived from field work, a series of inferences can be made about the capital inventory conditions (infrastructure) and the tourist equipment inventory of the six studied communities (hotels, restaurants and related services).

The research was based on the analysis of a specialized data bank and a wide field work where physical inspections were made as well as a classification of natural spaces as a framework for potential products in alternative tourism. Social capital inventories (infrastructure) were carried out together with a general classification, a tourist equipment inventory (accommodation, food and supplementary services) and an inventory of primary and secondary sources which could confirm the potential of the municipality of Tenosique (See photo 6) as alternative tourism with an emphasis on adventure and ecotourism.

In order to determine the feasibility of the markets, 409 surveys were applied divided in 3 areas: tourists, CEO's and tourism executives with the purpose of knowing the different visions and perceptions of tourism in supply and real demand.

The field work was big and varied in order to have an overall diagnosis, and with that, be able to delimit the proposals towards specific segments which can allow the development, the design of tourist products and the commercialization of these under social marketing.

RESULTS

Among the main findings in the research are the inventories of fixed capital and tourist equipment in both urban and rural environments. Likewise, potential main segments which are interested in ecotourism activities were identified.

Urban Fixed Capital Inventory

With regards to the head of the municipality, it was observed that in the aspect of infrastructure and communications, Tenosique counts with gas station service, taxi service, urban transportation, paved roads to the tourist destinations, road connections to other municipalities which show serious problems on the asphalt due to the lack of maintenance. Signaling is starting to have order though it is insufficient and far away from meeting tourist requirements.

The telephone service in this municipality has a good net, there are telephone booths that offer this service to far-way communities and special places that offer this service.

Rural Social Fixed Inventory

In this topic it was observed that the infrastructure and communications, most communities, except for *Redencion del Campesino*, do not have some basic services, such as gas stations, a regular transportation service or another type of transportation as taxis. The roads and ways that take to all these communities are fine for the traffic, though some of them are difficult to drive. The characteristics of the roads that lead to Tenosique's capital and the connecting roads that come in and out from this municipality and lead to other communities have segments built with asphalt and the other segments are dirt road. It was observed that the people who live in these communities are used to walking several kilometers in order to get some kind of transportation such as horses. According to the experts these conditions do not seem to be an obstacle to offer alternative tourist products.

Although the existent basic signaling is modest, it is useful to start with ecotourism and adventure tourism programs. There are telephone booths or telephones in some houses. Regarding supplementary services all the communities that were studied have a health center and elementary schools. There are also convenience stores with basic products.

Figure 1:

Santo Tomás landscape

URBAN TOURIST EQUIPMENT INVENTORY

With regards to the inventory of tourist full service (lodging, food, leisure and other supplementary services) it was observed that there were different type of businesses such as restaurants, “fondas” (inexpensive small rustic restaurants), taquerias (small restaurants for tacos), cafés, hotels, convenience stores, supermarkets, clothing shops, pharmacies, bank services, internet service. Although the poll was carried out under preliminary standards, it was observed that the economic entities provide in a more modest way, the minimum services which are required by the tourists, nevertheless basic services as food and lodging are not enough and deficient, since it is not easy to find a place to have breakfast. On the other hand there are different places opened at night which offer a wide variety of dishes, an aspect that calls the attention is that alcohol is not sold not even to accompany food orders.

The hotel infrastructure has severe deficiencies in relation to comfort, cleaning and maintenance. The time that guests usually spend in these hotels is very short since Tenosique is considered an overnight in transit location, therefore sightseeing and visits are limited to the archeological zone of Pomona which implies not using the local services

RURAL TOURIST INVENTORY

It was observed that there is a lack of lodging, food, leisure and other complementary services, however it should be taken into account that the services demanded by the eco tourists are different from the ones that are demanded by conventional tourism (See figure 2 and 3). Another element to be considered is that practically 100% of the parents who were interviewed said that they had practically no contact with tourist or activities related to this sector, since most of them have not left their communities in several years, for this reason it is understandable that they are not aware of their own resources. Some of them think that in their location there is nothing to exploit in relation to tourism, maybe this situation is due to their level of education since most of the them are illiterate and other did not finish primary, this factor may limit the vision of everything that could be done with the resources they have.

In the aspect of native languages the villagers, in several communities like *Corregidora*, *Allende* and *Miguel Hidalgo* still speak their native language, being for them very difficult to talk fluently in Spanish, that is why in some occasions they do not understand what they are told or inquired. This far from being a limitation, for us it is a key factor for success since the eco tourist would be able to appreciate this, as a valuable and important symbol of the culture, in contrast with what conventional tourists' wishes to find (snobbism).

Figure 2:

Figure 3:

Santo Tomas Cenotes (sinkholes filled with underground water)

In conclusion, the villagers' hospitality and disposition to the possibility of implementing and developing tourist products is regarded with sympathy and the residents are willing to cooperate and be trained in tourist services. The advantages of this community could be exploited if they counted with project leaders that could see and treat them with the seriousness and respect they deserve as authentic owners of the vast nature that surrounds them.

TOURIST SEGMENTS

The tourist segment in Tabasco is characterized by the presence of national tourists (95%) that come from the states of Veracruz, Campeche, Mexico City, Puebla and the State of Mexico, 5 % of the visitors come from abroad, and most of them come from the United States of America.

It was corroborated that people know the state of Tabasco and consider its tourist attractions acceptable, since 36% are people who visit the state for the first time, but the rest have been here in several occasions, these tourists return and this represents a 64% of purchase for this destination.

The preference for tourist locations are basically two: beaches and natural places, this shows that Tabasco can make the most of it due to its geographical environment, weather and vegetation meeting eco tourism, expectations and eco adventure programs, projects and products.

The preference for sightseeing places and tourists expectations has a tendency to look for a quiet place (32%), leisure and contact with nature had 10% of the preferences. This data suggests a great potential to places such as Tenosique and the Usumacinta Canyon State Park as an important adventure and ecotourism destination. (See figure 1).

Figure 1: The preferences activities of alternative tourism

Another segment studied was the one formed by CEO's belonging to the Cluster group of tourism, where there were also hotels, operators, service enterprises and consultants. People interviewed declared to be in favor of the tourist development of the Usumacinta Canyon State Park. Among the actions which they are willing to undertake are training and preparation for the people in the community in order to provide a good service to the tourist, besides the fact, that they intend to promote the area so that it attracts more visitors.

The segment which refers to residents and potential hosts in ecotourism, mention that they do not know the local tourist places; however they showed great interest in taking advantage of the natural resources, but making sure that the ecological surroundings do not get damaged. This means they wish to achieve an economical development, but with care and respect to the environment.

People interviewed referring to the potential growth of these places through tourist development is of relevance in social and economical terms because they assume that besides improving their lifestyle the tourist industry would generate jobs, and the opportunity for training so that once the Usumacinta Canyon State Park is already a tourist product, residents of the community can give provide a specialized service to the ones who come to visit.

CONCLUSIONS

According to the overall diagnostic of the economic and social conditions of the region where the Usumacinta Canyon State Park is located, it was possible to determine that the characteristics and conditions of the natural resources are immense for tourist development. The results of this investigation generate expectations for the design and the implementation of adventure tourism and ecotourism, but this last one is related to the development of studies on ecology, identity and culture, management and economical impact. The setting of tourism in Tenosique requires that the local communities and their leaders be aware of the identity and local culture, supported by a diagnostic and a cultural attraction inventory in a social and economic way.

Neme S. and Baeza G. (2006) state that Tenosique in a general way is perceived as a safe destination and it has wide entertaining and recreation alternatives. Through the identification of the Usumacinta Canyon State Park strengths; among these is its access, as well as the closeness to the head of the municipality where several services can make a tourist stay the most pleasant.

The Usumacinta Canyon State Park gathers all the conditions to attract investment due to its nature's potential. A tourist alternative route could be created in order to provide strategies which can help provide the appropriate competition to places around and the tourist markets.

The residents of the community as their host have a strong desire to make their community develop, because they consider tourism as an employment source, and a source for improving his level of life. They are aware of their weaknesses regarding knowledge and skills for providing tourists' attention. However, they are willing to be trained in order to become competent. The lifestyle of the residents of the community is not very hygienic and has a strong tendency to stomach diseases. Nevertheless, the Usumacinta Canyon State Park offers the opportunity to enjoy majestic landscapes and carry out different activities.

It is necessary, in order to build a tourist product in the Usumacinta Canyon State Park based on sustainable tourism, the creation of feasible economical enterprises, by applying preservation strategies of the natural resources, respect and value for ancient cultures. These topics require of training first and then of a continuous and strict monitoring from the community. In this sense, there is another issue to be considered by the designers of the ecotourism project of this area and this is the judiciary or legal problems which would come out of the tourist activity of the communities.

In this sense, two projects could be developed regarding a sustainable scheme which can favor nearby communities to the area of study, such as the development of community tourist products and a suitable commercialization plan, which will be necessary for an efficient management of the tourist activity.

In economical terms, it would be necessary to determine the impact of the tourist potential development through a benefit cost study of the components of the product, the evaluation of the infrastructure and existing tourist services as a potential for the product. The impulse of these tourist products does not require of a lot of investment, but of high hosting standards from the inhabitants of the communities, who are interested in participating in tourist activities, welcoming and guiding visitors.

In this section, the concern of the nearby inhabitants of the Usumacinta Canyon State Park is finally stated because they feel that once tourist development is in progress, the community will suffer of two great problems: deforestation, water and air pollution, due to “*rozas*”, the burning which is typical of these kinds of places.

THE EFFICACY OF CHINA'S EXCHANGE RATE POLICY AS A TOOL TO RECTIFY GLOBAL ECONOMIC IMBALANCE

Maleeha Rizwan, Cornell University

ABSTRACT

In the context of strong grievances of the current US administration regarding the adverse impact of an undervalued Chinese Renminbi on the level of output and employment in the United States, and mounting political pressure for a revaluation of the Chinese currency to rectify the growing global economic imbalance, this paper evaluates the impact of bilateral real exchange rates on Chinese exports to some of China's major export destinations: the United States, the European Union, Japan, Hong Kong, Taiwan, and South Korea, using monthly data over the period January 1997 to July 2010. Since a significant portion of China's exports consist of processed goods, the effects of movements in bilateral exchange rates for the following HS categories of exports which make up the major Chinese export commodities: prepared foodstuff, beverage and tobacco, textiles and textile articles, machinery and electrical equipment, and vehicle, aircraft, vessels and transport equipment, are examined separately to distinguish the impacts of exchange rate movements on ordinary and export-processing trade. A gravitational equation, consisting of the traditional gravitational variables, real bilateral exchange rates, measures of nominal exchange rate volatility, and dummy variables to capture the effect of intra-Asian integration on Chinese exports within and outside Asia is employed. The primary objective of this empirical investigation is to determine the importance of an exchange rate adjustment of the Chinese currency in assuaging the widening global economic imbalance in the short-run, particularly in terms of harnessing unprecedented Chinese export growth and reducing the OECD trade deficit, and analyze the implications of a Chinese exchange rate regime change for trade balances of newly industrialized countries (NICs).

DOES ECONOMIC NATIONALISM HELP STRATEGIC INDUSTRIES? THE EUROPEAN CASE

Anita Macek, Dr. Ferik & Partner D.O.O.
Rasto Ovin, University of Maribor

ABSTRACT

The financial and economic crisis of 2008 has again tempted the European Union's (EU) most developed economies to exercise a policy of economic nationalism. These processes have been, however, more or less financially based and less profound than the revival of economic nationalism in 2005. Then it was triggered by a strong rise of inward cross-border mergers and acquisitions (C-B M&A) in these countries. In this article the authors test the rationale of protective policies of the European governments when nationally important industries are concerned using the results of their 2009 empirical study on C-B M&A. The study proves that C-B M&A cause more benefits than threats. On the other hand, however, at the same time the real economic policy in the EU countries offsets the fear that liberalization of inward C-B M&A would endanger national economic goals. The paper does not support such a view. By putting the results of the study into the context of the Inward Foreign Direct Investment Potential Index by UNCTAD and the Index of Investment Freedom by the Heritage Foundation, the paper supports the view that the opening of strategically important sectors to international capital movements is compatible with the goals of national policy support for these sectors.

INTRODUCTION

According to UNCTAD (2010) global FDI flows were heavily marked by the financial and economic crisis in last two years. After a 16% decline in 2008, global FDI inflows fell a further 37% to \$1,114 billion in 2009, while outflows fell some 43% to \$1,101 billion. These processes were a part of the growing mistrust between former trade and financial partners, which are offset in endeavors of international bodies to more stringently regulate international capital flows. Also growing is the concern of exchange rate maneuvering by some important economies. In this respect economic nationalism (the term was popularized in the early 1980s by US political scientist Chalmers Johnson, who examined the rise of Japan in his book "Miti and the Japanese Miracle"), which more or less developed again in 2005 and was based predominantly on national governments' discomfort regarding growing C-B M&A in domestic strategic industries, was somehow pushed back. The difference between both sources of nationalistic acting of governments could be that the modern selfish actions have been triggered by crisis and could be marked as cyclical. On the other hand, economic nationalism demonstrated by the EU countries government's attitude in 2005 has structural grounds in possible C-B M&A influence on changes in the ownership structure of national strategic sectors with its consequences for national policies sovereignty. Should the sustainable trust be reestablished after we bring the present crisis under control, one could expect that such a protective attitude of European governments may again hinder C-B M&A.

The liberalization of international capital flows was formally legalized in the EU with the Treaty of Maastricht in 1994. However, most relevant for C-B M&A within the EU is the Directive 2004/25/EC of the European Parliament and of the Council on Takeover Bids (2004). Despite the fact that the years preceding 2004 were marked by dynamic integration processes between European states, it took 17 years (!) until the text of the Directive was acceptable enough so as to be adopted by EU member states

(Wymeersch 2008, 2). This is a consequence of the fact that member states wanted to keep the right to individually define mechanisms for defending important domestic companies from takeovers after implementing the new EU legislative (Freshfields Bruckhaus Deringer 2006, 12).

Soon after legalization in 2004 the takeover Directive already triggered the concern of European national governments that their national industrial policy supporting other economic goals would be out of control. The attitude of EU countries' governments turned out to be the protection of "national champions" – an expression that was assigned by the French Prime Minister De Villepin (2005 – 2007), who deliberately acted against foreign companies bids for some important French companies. This example was quickly followed by other European economies except for Great Britain.

When judging the actions of EU member states, however, one should note that after adoption of the EU Directive on takeover bids obviously the era of fast growth of inward FDI in the EU had started. So with respect to 2004 and 2005 the growth of FDI as a percentage of gross fixed capital formation in the EU was 125%, while in the same period it grew in developed countries of the world by 41%. Also, in the top 50 pairs of countries with the largest bilateral inward stock, in 2005 22 were from Europe, compared to 17 in 1995 (all data: UNCTAD 2007).

In this paper the authors explore the rationale of defensive policies that "protect" nationally important companies from foreign bids. The authors try to find whether a defensive policy in the case of strategic companies is the best choice for the national economy, as well as for these companies themselves. They base their conclusions on their own empirical research with data from 2008 and its comparison to data on FDI, as systemized by UNCTAD and Heritage Foundation.

THE STUDY OF 2009

An international comparison of C-B M&A's economic effects at the national level was carried out using the method of total analysis. It considers answers from a survey carried out in chosen academic communities and applied to the national economy. Respondents are professionals from business schools, who in one way or another are following real practice in the field in their home countries. In our research, we considered the respondents' view as typical and respectively representative for the country in which the business school is located. This could include the risk of personal bias. However, the respondents were invited to participate by individual schools' deans according to their field of research and teaching. As a rule they were in one way or another actively involved in the field of C-B M&A in their countries, or were at least well-acquainted with professional or public discussion on the matter in local circles and in the media.

Our analysis was carried out with the help of a questionnaire consisting of 21 questions in the fields of macroeconomic and microeconomic effects of inward C-B M&A in European economies. The sample included business schools from 36 European countries which were divided into two groups: 19 developed countries and 17 transition countries. The criterion used for this separation was the nature of their systems and national policies before 1989.

EMPIRICAL RESULTS

Where the benefits of C-B M&A are concerned, the strongest statistical significance was in both groups of countries assigned to market access and know-how, followed by technology transfer. Respondents in transition countries stressed – relative to those from developed countries – stronger pressure of international investors on national economic policy. Among threats, the most important in transition countries was the crowding-out of domestic companies by foreign bidders and insufficient price achieved

for sold domestic companies. Those two threats were also quite strongly present in industrial countries, however with substantially lower importance relative to transition economies.

An analysis of the microeconomic effects to a certain extent shows divergent results for both groups of countries. For industrial countries the biggest benefit of C-B M&A proved to be the consolidation of strategic sectors, while reduction of domestic firms' capital was on the top of the threat list. In transition countries consolidation of strategic sectors was also considered on the top of the benefits list, while the top threat informal pressure of foreign investors on market conditions. This effect of C-B M&A achieved in industrial countries was listed as quite a low value. The less present effect in both groups of countries here was the contraction and closing of R&D departments of firms acquired from foreign companies. With microeconomic effects also the forms of acculturation with inward C-B M&A were analyzed. With 62% (transition countries) and 67% (industrial countries) the biggest weight was assigned to integration as a form of acculturation. Readiness for assimilation in transition countries was expectedly higher than in industrial countries (36% vs. 29%), while separation was quoted as an exception in both groups of countries (for terminology see Nahavandi and Malekzadeh 1988).

In general, the obtained results of the study 2009 (Maček 2009) lead us to the conclusion that despite differences between both groups of economies with inward FDI in the form of C-B M&A in 2008 mostly positive effects in both countries were present. These findings diverge from real policies of industrial states described above. So we will compare the results of our study with indicators introduced by UNCTAD (Inward FDI Potential Index) and the Heritage Foundation (Index of Investment Freedom).

In order to analyze the need for protectionism in European economies the variables provided by the 2009 study were subject to further analysis. Using factor analysis factor "market and technology factors" (denominated as MT) and factor "business environment factors" (denominated as BE) were obtained. They were subject to extensional statistical tests to prove their eligibility to be included into linear regression equation, which explored their potential relationship with Inward FDI Potential Index – here denominated as $INDEX_{FDI(P)}$.

$$INDEX_{FDI(P)} = 0.728 - 0.057MT - 0.064BE \quad (1)$$

(0.000) (0.012) (0.005)

Equation (1) shows that the fewer are the benefits incorporated in MT and BE the higher would be Inward FDI Potential Index. The MT increase of one unit lowers $INDEX_{FDI(P)}$ by 0.057 units and the BE increase by one unit lowers $INDEX_{FDI(P)}$ by 0.064 units. The model therefore suggests that weaker the benefits of FDI inflows, the higher the Inward FDI Potential Index.

According to our study C-B M&A should promote consolidation of strategic sectors, thus suggesting that the openness of the countries has positive consequences for development of these sectors. Following logical expectations the openness of an economy should be therefore positively correlated with Inward FDI Potential Index. In order to check this statement in the above model the answer to the question on influence of C-B M&A on economic strength of strategic enterprises (denominated as SES) was included.

(2)

$$INDEX_{FDI(P)} = 0.630 - 0.053MT - 0.066BE + 0.028SES$$

(0.000) (0.014) (0.003) (0.044)

Equation (2) shows that increase of the MT by one unit, corresponds the reduction of the $INDEX_{FDI(P)}$ by 0.053 units, the increase of the BE causes the $INDEX_{FDI(P)}$ to decrease for 0.066 and the SES increase brings the $INDEX_{FDI(P)}$ increase by 0.028 units. The model therefore suggests that enhancing the position of strategic enterprises and smaller benefits in the form of market and technology factors and business environment factors resulted by C-B M&A, raise the Inward FDI Potential Index.

These findings enable the conclusion that the policy of economic nationalism does not represent a rational strategy either in the sense of national economic goals or in the sense of the strengthening of strategic sectors.

Our next step was to verify the relationship between Index of Investment Freedom and government intervention to protect the domestic economy and shareholders (denominated as GI), plus the influence of C-B M&A on economic strength of strategic enterprises (denominated as SES). The Index of Investment Freedom is an integral part of the Index of Economic Freedom assessed by The Heritage Foundation.

The assumption in our model was that for international capital flows the development of financial institutions and their supervision is especially relevant. If their level of development is lower, we expect more government interventions to protect the domestic economy and domestic shareholders from unstable decisions of foreign investors. This should be offset in lower value of Index of Investment Freedom (denominated as $INDEX_{FDI(freedom)}$). On the other hand, in an environment where FDI strengthens strategic companies, we should normally have a higher level of economic freedom.

$$INDEX_{FDI(freedom)} = 0.630 - 0.067GI + 0.067SE \quad (3)$$

(0.000) (0.020) (0.047)

Equation (3) shows that the less frequent the intervention of governments is in the C-B M&A processes in order to protect domestic economy and shareholders, the higher is an increase in the free flow of foreign investment. Strengthening of the position of strategic sectors as a consequence of C-B M&A, on the other hand, increases the value of $INDEX_{FDI(freedom)}$. According to these results the best solution for strategic enterprises should be to provide them with an open economic environment.

CONCLUSIONS

The revival of economic nationalism in Europe might have been triggered by the liberalization of international capital flows after adopting the EU Directive on takeover bids. Activist reaction by the governments of the most important EU governments, except for Great Britain, in this way actually demonstrated that when the goals of economic growth and employment are concerned, they rely rather on their control over nationally important sectors and companies than on the opening of the economy.

Our study on inward cross-border mergers and acquisitions in Europe proves that interested (academic) community has judged benefits and threats of C-B M&A much less critical than real economic policy. In order to prove which standing is closer to the facts, an additional analysis by introducing existing international FDI indicators was carried out. By using models, where our results were combined with the Inward FDI Potential Index (UNCTAD) and Index of Investment Freedom (the Heritage Foundation), we carried out linear regression. In both cases the analysis proves that once establishing themselves as strategic sectors and companies, the latter gain economic strength when involved in free international capital flows and when government intervention for their protection and for the protection of their shareholders is reduced.

BIOGRAPHY

Anita Maček Ph.D. has defended her Ph.D. in 2009 and has been the youngest doctor at the University of Maribor in the field of economics and business in the generation. She does her research in the field of cross-border mergers and acquisitions and has published articles and papers on this topic in national and international journals, books and media. For the present she is a consultant by Dr. Ferk & Partner Consultants Munich, Maribor and Ljubljana.

Rasto Ovin Ph.D. is a full professor at the University of Maribor, Slovenia and a Head of the Institute of Economic Diagnosis and Forecasting. Prof. Ovin has been recognized as one of most influential Slovenian economists. He has been permanently commenting economic developments for Slovenian and international media. For the present he is a vice-president of the supervisory board of Nova ljubljanska banka – the biggest Slovenian bank and a vice-president of the Fiscal council of the Republic of Slovenia.

EVERYONE WANTS FLEXIBLE SCHEDULING! NO, ALMOST EVERYONE

Mary H. Kelly, Texas A&M University-Central Texas

Margaret M. Britt, Mount Vernon Nazarene University

Thomas G. Hardenbergh, University of Michigan

ABSTRACT

Flexible scheduling of college courses conveys a different meaning to individual students. This study finds that, regardless of definition, flexible scheduling is desired by not only the majority of students, but across a broad spectrum, including traditional and nontraditional profiles, undergraduate and graduate status, and courses held in widely disparate learning environments. Additionally, the study suggests a steady, albeit small, proportion of students does not desire flexible scheduling. The study was restricted to upper-level undergraduate and graduate students enrolled in certain finance courses required in the student's degree plan or selected as electives in a degree plan. Students ranged in age from 19 to over 50, with part-time and full-time status. Courses met in a traditional setting of three days per week or one evening per week, in a non-traditional setting of one Saturday per month or totally online, and over traditional length and accelerated semesters. Class sizes ranged from eight to forty students at two universities that differed by size (25,000 vs. 2500), region of the country (Midwest vs. Southwest), name recognition (national vs. regional), and accreditation (AACSB vs. ACBSP). The study makes significant contributions to the literature and additional research will explore pedagogical aspects associated with flexible scheduling.

STAKEHOLDER PERCEPTION OF CORPORATE SOCIAL RESPONSIBILITY -CSR REPORTING AND ORGANIZATIONAL AGE MATTER

Petra F.A. Dilling, New York Institute of Technology

ABSTRACT

As the topic of corporate social responsibility (CSR) globally is getting more and more attention not only by many different company stakeholders, researchers are also increasingly exploring CSR, its causes as well as its implications. However, so far, not much is known about CSR perception. This study explores the link between stakeholder perception of CSR and its relationship with underlying factors. The findings suggest that organizational age of the corporation, community involvement, and cultural diversity have a significant influence on CSR perception by stakeholders. Another criterion of importance is the fact of a published CSR or sustainability report. No significant results were found for the sustainable use of natural resources and Dow Jones Sustainability Index inclusion. The study concludes with recommendations for corporations on how they can enhance CSR perception by stakeholders.

KEYWORDS: corporate social responsibility, perception, stakeholders, CSR reporting, cultural diversity, CSR reporting, community investment, community involvement, sustainability reporting, sustainable use of natural resources, Dow Jones Sustainability Index (DJSI), organizational age, multivariate regression

INTRODUCTION

In a definition proposed by the Commission of the European Communities corporate social responsibility is described as societal responsibility for a company to integrate social and environmental concerns into their activities and stakeholder relationships on a voluntary basis (European Commission, 2002). The World Business Council for Sustainable Development describes CSR as “commitment of business to contribute to sustainable economic development, working with employees, the local community and society” (WBCSD, 2004). In the literature, many different definitions have been developed, from various angles and in multiple contexts. For a summary of definitions, refer to Swaen & Chumpitaz (2008). However, until now, a common definition of CSR has not been established (Mutch & Aitken, 2009). Nonetheless, companies are increasingly devoting significant resources to demonstrate their CSR commitment (Swaen, 2008).

When we look closer for reasons for this commitment we find that some corporations invest in CSR because it is the “right thing to do”; it is aligned with the beliefs of the management and corporate culture; it is part of the strategic plan; it is a current thing to do as most of the other organizations do it; or management expects to be rewarded for it by the market. Regarding the latter it should be mentioned that numerous studies were devoted to exploring the linkage between CSR and financial performance. In the existing literature, there is still no consensus on the answer to the question if suitable CSR programs will lead to better financial performance of the corporation. About seventy percent of related studies showed a positive and statistically relevant relationship between CSR and financial performance (Dilling, 2010). Martin Curran provides a systematic review of evidence on the relationship between CSR and financial performance (Martin Curran, 2005). Delivering profits to shareholders is important, but organizations are also subject to broader stakeholder interests as well as the need to demonstrate a balanced perspective towards doing business (Maon et al., 2009).

LITERATURE REVIEW

Various research studies have dealt with the subject of CSR and its impact on consumer behavior, attitude, and corporate reputation (Berens et al., 2005). CSR is perceived to have a positive impact on corporate image as well as customers' and other stakeholders' satisfaction (Lindgreen et al., 2009). On the specific subject of consumer perception of CSR, a study noted an increase of ethical consumerism which the authors trace back to the fact that there seems to be growing empowerment as well as impatience with the current performance of the company (Globescan, 2009). Another study focusing on consumer perception highlights the need for more emphasis of CSR activities other than in the annual report and website (Singh et al., 2008). Based on the analysis of their empirical results, the authors go as far as to state that those traditional communication channels are not reaching the consumers. This confirms the trend that companies that communicate their CSR activities through many different channels will have a higher CSR perception compared to those that will not communicate the activities as much (Wagner et al., 2009). In fact, communication of CSR has been cited as being one of the crucial elements when making people aware of CSR initiatives. Liston Heyes and Ceton (2009) argue that in order to send a "positive" signal, corporations not only have to be active regarding CSR but also have to publicize the CSR performance efficiently. In addition, the United Nations Global Compact and the Global Reporting Initiative (GRI), for example, are undertaking advocacy and other efforts to encourage companies to publish sustainability reports by applying certain standards and using their platforms (Global Reporting Initiative 2010 and UN Global Compact 2010). Please note that for the purpose of this study the terms sustainability report, corporate social responsibility report, and citizen report are used interchangeably. Therefore, over the last years, many companies have published separate sustainability or CSR reports.

H1: A CSR report published for the main purpose of informing stakeholders about CSR activities of the company will result in a higher perception of CSR.

In their 2009 paper, Rhee and Valdez argue that social selection processes favor older organization due to them being "reliable" and "accountable". Moreover, with respect to consumers, it has been stressed in the past that they, as one of the main stakeholder groups, often perceive companies as being active regarding CSR if they are familiar with them or if they like the products that the companies sell, or the services they provide. It is assumed that this is transferrable to CSR perception by all stakeholders. Additionally, in a study conducted in Canada in 2008 on perceived versus actual CSR performance, it is mentioned that a "halo effect" appears to be evident for certain, very popular, brands (MapChange, 2008). Therefore, it is hypothesized that companies that are well known will have a higher CSR perception. The fact that a company is well known, very often, correlates to the fact that it has been around for a long time. Thus, in the absence of a score for being well known for the studied companies, we are using organizational age as a proxy for being well known.

H2: Companies with a higher organizational age will have a higher CSR perception.

Steurer et al. (2005) state that corporations are confronted with economic, social, and environmental claims by their stakeholders. Undeniably, stakeholders have certain expectations when it comes to corporate behaviour. They will reward behaviour they see beneficial to the corporate environment, themselves, as well as the corporation itself. One of those expectations is community investment. Community investment and reporting thereof can lead to enhancements in stakeholder relationships and accountability (Tsang et al., 2009). According to research on forty European companies, for example, "community" is the most mentioned stakeholder on websites of corporations (Silberhorn & Warren, 2007). Moreover, it is also being argued that all stakeholders have a preference for broader community involvement by businesses in general (Amato & Amato, 2007).

H3: Companies that engage in community development will have higher CSR perception.

While community investment is an important stakeholder expectation there are others that might be equally important and therefore should be examined as well. One that seems to have become increasingly important over the last years is workforce and cultural diversity efforts. Like community, employees are also often being named the most important stakeholder group (D'Humieres & Chauveau, 2001). Furthermore, there is an indication that the market rewards a company for being proactive in its diversity activities (Bird et al., 2007).

H4: There is a positive relationship between cultural diversity efforts of a corporation and its stakeholder CSR perception.

With regard to environmental stakeholder claims, evidence suggests that stakeholders react positively to environmental protection (Bird et al., 2007). The authors state that if a company is being identified as failing to meet regulatory standards with respect to the environment, it will have a negative impact on the value that the stakeholders place on them. Other authors claim that environmentally ethical behaviours and morally acceptable environmental actions are being demanded of corporations (Onkila, 2009). There is also evidence that companies with "green products" are being perceived more favorable than those whose efforts towards sustainability are not reflected in their product lines (MapChange, 2008). Therefore, it is assumed that companies which apply sustainable processes will have a higher perception regarding CSR than others.

H5: Stakeholders will show a higher CSR perception for companies that are applying sustainable practices when using natural resources.

As investor interest in sustainability is growing, sustainability indices have been developed that track the financial performance of the leading sustainability-driven companies. Among these are the Dow Jones Sustainability Index, the FTSE4Good as well as the Domini Social Index. These indices have given credibility to the notion of investment in sustainable companies (Lopez et al., 2007). Additions to and droppings from the index, which take place on an annual basis, are usually accompanied by substantial press coverage.

H6: Corporations that are included in the Dow Jones Sustainability Index will have higher CSR perception by their stakeholders.

DATA AND METHODOLOGY

The Reputation Institute, in connection with the Boston College Center for Corporate Citizenship, annually publishes corporate reputation and social responsibility rankings (Reputation Institute, 2010). For their 2008 report, the Reputation Institute surveyed more than 60,000 members of the general public on their feeling about company performances along seven dimensions of reputation. The reputation score consisted of ratings regarding managerial, technical, and institutional company performance indicators. The report then takes a closer look at rankings incorporating institutional dimension scores which included perception ratings on corporate citizenship, governance, and workplace. The combined index of those perceptions is then called the corporate social responsibility index. The scores for the 50 most socially responsible ranked companies in the US for 2008 are used as scores for CSR perception for our study. The sample for this study consisted of the 50 companies for which the Reputation Institute provided CSR perception scores for the year 2008. The CSR perception score was then used as the independent variable. The data related to those companies was then obtained by analyzing the company web pages (in 2009), 2008 annual reports, 2008 press releases as well as the 2008 sustainability reports.

It was assumed that the information provided by the corporations is an accurate indication on what their efforts in those areas actually were. Scores between 0 and 10 were assigned to the different independent variables depending on the information provided. This applies to the independent variables "community investment", "cultural diversity" and "sustainable practices". Examples for community investment included volunteerism programs, community activities, disaster response and humanitarian relief

programs, community partnerships and sponsorships, philanthropy programs, neighbourhood program, etc. Cultural diversity information encompassed non-discrimination policies, workforce diversity programs, cross-cultural communication, policies on respect for others, multi-cultural awareness, collaboration culture, equal opportunities, etc. Examples for sustainable practices with respect to natural resources were recycling, solar usage, water conservatism, energy saving, greenhouse gas emissions control, and waste programs as well as alternative energy and renewable energy and land use planning programs.

Before any statistical analysis was conducted, the data was tested to verify that the basic assumptions of the general linear model were met. Table I presents descriptive statistics while Table II shows bivariate correlations for all variables. The examination of scatter plots and normal probability plots did not show violations of normality, multivariate linearity, or homoscedasticity.

The 50 companies in the sample have been in business between 12 and 203 years, on average 84 years. They were active in 13 different sectors. The average 2008 gross profit was 15 million USD. While 84% of the corporations issued a CSR report only 34% of the corporations issued a CSR report applying the Global Reporting Initiative (GRI) guidelines. 48% of the companies were included in the 2008 Dow Jones Sustainability Index (DJSI). In 2008, the companies issued between 0 and 124 press releases with CSR as subject. CSR was specifically mentioned between 0 and 16 times in the 2008 annual reports.

Table I: Descriptive statistics and frequencies (n=50)

Item	Minimum	Maximum
Organizational age	12	203
Employees	1,400	410,097
Gross profit	177,000	70,948,000
CSR press releases	0	124
CSR in annual report	0	16

EMPIRICAL RESULTS

Table II indicates that none of the independent variables was significantly correlated with the CSR Index 2008. This does not mean that the independent variables cannot be used as predictor variables as inter-correlations can have an impact on the significance of relationships. Correlations give us an indication on how variables are associated, however, variable dependencies cannot be derived. A number of significant correlations between several of the predictor variables can be observed.

Table II: Correlations among the variables

Variables	1	2	3	4	5	6	7
1 CSR Index 2008	1						
2 Organizational Age	0.189	1					
3 CSR report	-0.253	0.244	1				
4 Natural Res.	0.145	0.202	-0.51	1			
5 Cultural Diversity	-0.061	-0.18	-0.406**	0.266	1		
6 Community Investment	-0.074	0.038	-0.431**	0.301*	0.292*	1	
7 DJSI	0.145	-0.043	-0.310*	0.337*	0.483**	0.371**	1

* $p < .05$, two-tailed; ** $p < .02$, two-tailed

Multiple regression analysis is used in order to determine the predictability of the outcome of the dependent variable based on the independent variables. The results of the regression are shown in Table III. From Table III, four variables influencing the CSR perception score are significant ($F=3.006$, $p=0.015$). CSR perception is positively influenced by company age and CSR reporting and negatively influenced by cultural diversity and community investment. More specifically, if the age of the corporation increases by one year, the CSR perception score will increase by 0.302 ($t=2.208$, $p=0.033$).

Hence, in this study, age has been shown to be an important factor when it comes to predicting CSR perception. The same applies to CSR or sustainability reporting which positively influences CSR perception by stakeholders. In fact, the B coefficient for CSR reporting is at 0.533 units ($t=3.371$, significant at 0.002), meaning that if a company publishes a CSR report, CSR perception scoring increases by 0.53. The independent variables for cultural diversity and community development are also statistically significant. However, contrary to H3 and H4, the relationship between them and the dependent variable is negative. This implies that if, for example, cultural diversity and community development increase by one unit, CSR perception would decrease by 0.32 and 0.36 units, respectively.

Hypothesis 5 which predicted that companies which apply sustainable practices when using natural resources will have a higher CSR perception was not supported. Table III also shows that, contrary to our prediction, the B coefficient for the variable for the DJSI inclusion is not significant. Therefore, H6 is not supported.

Table III: Multiple regression analysis

Variables	Unstandardized Coefficient		Standardized Coefficient beta	t	Sig.
	B	SE			
Constant	70.059	1.212		57.781	0.000
Organizational age	0.017	0.07	0.302*	2.208	0.033
CSR report	3.770	1.118	0.533**	3.371	0.002
Natural Resources	0.175	0.144	0.175	1.214	0.231
Cultural Diversity	0.272	0.132	-0.321*	-2.064	0.045
Community Investment	-0.342	0.147	-0.356*	-2.328	0.025
DJSI	1.147	0.809	0.221	1.417	0.164

N=50, R-square=0.296, F=3.006*, p=0.015*

Note: Categorical variables: CSR report, 0=no, 1=yes, DJSI: 0=no, 1=yes * $p<.05$, two-tailed; ** $p<.01$, two-tailed

DISCUSSION

The results of this exploratory study provide support for the assertion that companies can influence stakeholder perception with regard to CSR. Regression analysis indicated that among the independent variables used in the analysis, organizational age, CSR reporting, the level of cultural diversity and community involvement have a significant influence on CSR perception. The regression analysis revealed that the four variables accounted for almost 30% of the variance of CSR perception.

Well established companies enjoy a perception advantage when it comes to CSR; however, according to our study, preparing and publishing a CSR report seems also an effective way to raise CSR perception. The findings on the variables cultural diversity and community investment and their negative influence on CSR perception are surprising. One would assume that increased CSR activities will have a positive impact on stakeholder perception regarding CSR. Could it be that stakeholders perceive the mention of those CSR activities as “pure” marketing efforts without credible follow-through by the corporations? Or could it be that CSR activities are not being perceived as important when assigning an overall CSR score for a company? This, however, would not explain the negative association between the variables. The fact that some corporations already have long standing and extensive community and cultural diversity programs could set stakeholder expectations quite high. This would confirm Golbescan’s statement on stakeholder empowerment and impatience regarding company CSR performance (Globescan, 2008). Note that the CSR maturity level also varies quite a bit between corporations. What for some companies represents a big step forward could be considered a step backward for other companies, hence relative CSR involvement in the relevant sector could be considered a gauging factor.

LIMITATIONS AND CONCLUSIONS

The purpose of this paper is to examine the relationship between CSR efforts as well as company characteristics and the level of CSR perception by stakeholders. In conclusion, this paper is the first to find statistically significant independent variables that influence stakeholder CSR perception. The results of this exploratory study suggest that by undertaking certain CSR efforts managers can achieve a higher CSR perception for their companies. If the results of a consumer study undertaken by Swaen & Chumpitaz in 2008 are transferrable to all stakeholders, a positive influence on overall stakeholder trust toward the company can be achieved through CSR activities (Swaen & Chumpitaz, 2008).

While this study provides insights into CSR perception and its related factors study limitations identify further research areas. For the purpose of this study, it is assumed that the amount of information provided in the CSR reports, company websites, annual reports, and press releases represents an accurate reflection of CSR activities that the companies engage in regarding CSR. This assumption could be verified. Given that there is an indication for a strong link between corporate social responsibility and corporate reputation, as pointed out in various publications (Docherty & Hibbert, 2003, Brammer et al., 2006), stakeholders are questioning the "true" intentions of the corporations as they market and implement their CSR program. Are corporations engaging in CSR doing this in the hope to enhance their reputation; to increase share prices or market value; or is CSR actually part of their corporate culture and vision? Some authors suggest that, while efforts towards CSR are increasing, perception of consumers and/or stakeholders are worsening. This could also be based on the fact that expectations have been raised as corporations are actually investing more in that area; and therefore, the expected level of engagement has been raised for everyone. It is also important to consider that better CSR performance does not necessarily translate into higher levels of CSR perception.

In their 2008 study, Singh et al. state that, on average, consumers perceive companies as not providing sufficient information on their CSR activities (Singh, 2008). The results of this study confirm this statement. If companies accurately and effectively report on their CSR program and its implementation into the overall strategy, stakeholders, including consumers, will acknowledge this. As mentioned above, CSR perception is higher if companies publish a separate sustainability, citizen or CSR report. Therefore, if companies are committed towards CSR, they need to think about how they want to communicate this commitment to the various internal and external players. The study confirms another of Singh's statement indicating that the use of traditional channels is not an appropriate tool to raise CSR awareness for the CSR activities and programs of a company. Tench et al., in 2007, claim that executives and communication specialists are unsure on how to communicate their CSR strategies most effectively (Tench, 2007). Clearly, companies that use communication of CSR activities as a public relations tool without a strong commitment towards achieving their mission with CSR as a major component will fail. Those companies make it harder for others to maintain or regain the trust of the stakeholders.

A separate CSR report with relevant and targeted information for different stakeholder groups in various formats and delivery modes represents an effective option according to our findings. Furthermore, organizations have to be ready to communicate honestly, internally as well as externally, on what they have accomplished and what they hope to achieve (Maon et al., 2008). Additional steps could include assurance of the CSR report by a trustworthy and competent assurance provider. Further research is needed in this area.

Even though most of the companies in the analysis have a global footprint, the study itself does not assume a cross-cultural perspective. In view of the global aspect of CSR, it would be interesting to investigate CSR perception in different countries as culture has been documented as being one of the most crucial variables when it comes to ethical decision making (Rawwas et al., 2005).

In summary, companies will have to strengthen their stakeholder engagement and communication overall. Done right, CSR can be instrumental to increase shareholder value as well as to boost employee morale.

Organizations need to understand how stakeholders will perceive their businesses. More importantly, corporations that would like to be perceived as being active or even a leader in the area of CSR need to develop a comprehensive and integrated CSR framework. CSR programs, policies, and processes have to be monitored and updated continuously; environmental and social performance have to be assessed; stakeholders need to be consulted on an ongoing basis; and efficient communication and conversations with all stakeholders will be the key to success.

US ADOPTION OF IFRS MAY HELP TO JUMPSTART THE US ECONOMY

Anne B. Fosbre, Georgian Court University
Ellen M. Kraft, Richard Stockton College of New Jersey
Paul B. Fosbre, New Jersey City University

ABSTRACT

The United States prompt adoption of International Financial Reporting Standards (IFRS) may help to jumpstart the US economy. Investors would be able to make comparisons and evaluate investment opportunities worldwide. US Multinational companies would be able to cut costs. In preparation of financial statements using IFRS the results presented usually portray higher figures. This would help to present more favorable valuations and help to promote growth with improved financial reporting. The result will be more job opportunities, a reduction in uncertainties, and may help to jumpstart the US economy.

INTRODUCTION

The movement of business toward a global economy has accelerated the need to move toward global accounting standards. The United States prompt adoption of International Financial Reporting Standards (IFRS) may help to jumpstart the US economy. This paper will examine existing differences in required reporting by the SEC as well as other factors affecting the adoption of IFRS in the United States. We will examine some of the factors that may have impeded the recovery of the United States economy and the instability that has been created as a result of not adopting IFRS.

LITERATURE REVIEW

There have been studies that show the positive effects of adopting IFRS on corporate financial statements and economic growth. According to a 2004-2006 study of reconciliations where firms were previously required to detail calculations of converting IFRS to US GAAP disclosed that more than 70% of the companies examined had a higher return on equity under IFRS compared to US GAAP (Lee, 2009). Furthermore, a study of 3,100 firms in 26 countries mandated to adopt IFRS revealed powerful benefits including increases in companies' stock market value and lower cost of capital. The benefits are supported by strong regulatory requirements (Lee, 2009).

Business leaders around the world think that IFRS adoption will be important for economic growth. In a global survey of business leaders on the importance of IFRS for economic growth, 55% felt it was very important (AICPA, 2008). A 2007 survey by the International Federation of Accountants, (IFAC) of 143 leaders from 91 countries, 90% reported that a single set of international financial reporting standards was very important for economic growth in their countries, (International Federation of Accountants, IFAC, 2007). The Group of Twenty, (G 20) leaders in 2009 called for the standard setters to redouble their efforts to complete convergence of global accounting standards by June 2011.

GERMANY, CHINA, INDIA, IFRS and THE NEW YORK STOCK EXCHANGE

In reviewing current happenings of foreign firms listed on the New York Stock Exchange dramatic changes have occurred. Germany has delisted all but three German firms from the New York stock exchange. The listings have been moved to the Frankfurt Stock Exchange in Germany. The primary reason for delisting German companies from the New York stock exchange is expensive accounting fees

such as Sarbanes Oxley requirements. Germany has been paying \$10,000,000 to \$15,000,000 in annual fees to the United States to maintain the listings (Kelsey, 2010). As a result of delisting the German companies from the New York stock exchange the American markets are no longer attractive to Germany.

By contrast, Germany is contracting their US and Global involvement, whereas China and India are expanding. Already listed on the NYSE (using IFRS), China is expected to expand the use of IFRS financial reporting for all medium and large organizations by 2012. India is also expanding and will adopt IFRS standards in April 2011 (Wilson, 2010).

According to the SEC Progress Report released on October 29, 2010, China has indicated in its exposure draft issued in 2009 that it intended to make every effort to eliminate existing differences between Accounting Standards for Business Enterprises, (ASBE) and IFRS by 2011. The World Bank Report of 2009 has stated that the ASBE are “substantially converged” with IFRS (SEC, 2010).

The Ministry of Finance published a roadmap late last year stating that China will complete ASBE convergence to IFRS by 2011. All medium to large organizations will be required to use this revised set of standards by 2012. Many of the largest organizations in China have already adopted IFRS including 17 firms listed on the Hong Kong Stock Exchange and on the NYSE. One of the firms listed is Petro China Ltd (PTR) the largest oil company in China (Wilson, 2010).

India has announced a plan to adopt IFRS as the Indian Financial Reporting Standards effective April 2011 for all listed and “large private companies”. Medium sized companies will follow in 2013 and smaller organizations in 2014 (Wilson, 2010).

FOREIGN FIRMS ON NEW YORK STOCK EXCHANGE

Table 1 lists of some foreign firms on NYSE showing increased profits from 2008 to 2009 from American Capital Markets. These companies include Heineken, Diageo (owns Guinness and Pillsbury), and Novartis (Diageo, 2009; Heineken, 2009; Novartis, 2009).

Table 1: Foreign Firms Listed on the NYSE Showing Increased Profits from American Capital Markets

Company	Currency	2008 Profit (millions)	2009 Profit (million)
Heineken	Euro	347	1,142
Diageo (owns Guinness & Pillsbury)	United Kingdom	1,597	1,725
Novartis	Dollar	8,233	8,454

Table 1 lists four companies that are listed on the New York stock exchange that showed increased profits (in millions) from 2008 to 2009. The currency used for the company is listed in the second column. The profits for 2008 and 2009 are listed in the third and forth columns. The source of the data was the 2009 company annual reports.

From the above information, foreign firms listed on the NYSE have shown increased profits and a benefit from American capital markets.

Some companies have found the American capital market to be more attractive than in the past. In the case of INBEV, a Belgium firm using IFRS has purchased Anheuser Busch, an American firm reporting under US GAAP. As a foreign firm listed on the New York Stock Exchange, INBEV has converted the Anheuser Busch financials to IFRS. The combined firm is called Anheuser Busch In Bev, (ABInBev), (ABInBev, 2009). The first quarter 2009 reporting results showed earnings of \$783,000,000 compared to \$398,000,000 in the first quarter of 2008. One year after the buyout, quarterly results have shown a 25% earnings growth (Tritto, 2008). The results from the world’s largest brewer show an increase in value using IFRS reporting.

THE ELIMINATION OF LIFO A BARRIER TO IFRS ADOPTION BY THE UNITED STATES

In order for the US to adopt IFRS accounting standards, the elimination of Last In First Out Inventory (LIFO) valuation method would have to occur. The Obama 2010 budget presented included a proposal to eliminate the use of LIFO for income tax purposes. Tax payers that currently use the LIFO method for taxes and financial reporting would be required to revalue their beginning LIFO inventory to its FIFO value in the first taxable year beginning after December 31, 2011 (Tax Policy Center- Urban Institute and Brookings Institution, 2010). This one time increase in gross income would be taken to account ratably over the first taxable year and the following seven taxable years. LIFO would be repealed and companies would pay tax on the accrued difference between LIFO and FIFO inventory valuations. It would impose a substantial one time tax and a smaller permanent tax as long as prices are increasing. In HR3970 Ways and Means Committee Chair Charles Rangel proposed to allow firms to spread income from the initial adjustment from LIFO to FIFO over eight years. (Tax Policy Center- Urban Institute and Brookings Institution, 2010). Already proposed is the elimination of the LIFO inventory valuation beginning 2012 by the Treasury Department. The increase in taxes resulting from the elimination of LIFO should help to offset future proposals by Obama to raise taxes. Also, the exclusion of LIFO allows the US to remove a major hurdle in adopting IFRS.

Effect of Switching To FIFO: A Theoretical Example

The change in using FIFO instead of LIFO for inventory valuation with increasing prices will result in higher figures and provide an increase in the current ratio determined by dividing current assets by current liabilities. Table 2 gives an example comparing the ratio of current assets to

Table 2: Comparison of Quick Ratio for a Hypothetical Company using LIFO and FIFO

Under LIFO		Under FIFO	
Current Assets		Current Assets	
Cash	\$100,000	Cash	\$100,000
Accounts Receivable	50,000	Accounts Receivable	50,000
Inventory LIFO	<u>150,000</u>	Inventory FIFO	<u>\$350,000</u>
Total	\$300,000	Total	\$500,000
Current Liabilities	\$100,000	Current Liabilities	\$100,000
Current Ratio	3:1	Current Ratio	5:1

Table 2 compares the current ratio for a company using LIFO inventory valuation and FIFO inventory valuation. The example illustrates that the current ratio is higher using FIFO inventory valuation meaning that a company is better able to pay its bills using the FIFO inventory valuation.

current liabilities for a company using LIFO and FIFO that has current assets of \$100,000 cash and \$50,000 accounts receivable; and current liabilities of \$100,000. The inventory using LIFO is \$150,000 and the inventory using FIFO is \$350,000. The current ratio is calculated as Current Assets/Current Liabilities. The current ratio is 3:1 using LIFO and 5:1 using FIFO.

The current ratio is a measure of the company's ability to pay its short-term liabilities with its short-term assets (cash, inventory, receivables). The higher the current ratio, the better able the company is to pay its bills. The company in this example has a current ratio of 3:1 using LIFO compared to 5:1 using FIFO. When the company uses the FIFO valuation method their current ratio increases. A current ratio of 5:1 means the company under FIFO would be able to pay their bills five times over compared to being able to pay their bills three times over using LIFO. The valuation of the company using FIFO would be higher allowing the investor to feel more secure in their investment.

Effect Of Switching To FIFO: A Practical Example Using The Effect On Corporate Taxes

To determine whether income taxes increase in practice, rather than in theory, data of the impact of a FIFO adoption by companies was reviewed from a Georgia Institute of Technology Study that was completed in 2008 (Mulford & Comiskey, 2008). The results of the study revealed in a sample of 30 companies that were using LIFO if they had been using FIFO taxes would have been 10% and 12% higher in 2006 and 2007 respectively. Furthermore, the study revealed the companies would have had more than \$15,000,000 of cumulative federal income taxes due if they had switched from LIFO to FIFO. The companies with the highest taxes are the petroleum refining companies. This includes Exxon-Mobil, Marathon Oil Company, Valero Energy Corporation and Sunoco (Mulford & Comiskey, 2008). The FIFO pre-tax and LIFO pre-tax income for the petroleum refinery companies showed an average percent change of 48.7%. Sunoco had a 113.2% increase in pre-tax income when switching to FIFO (Mulford & Comiskey, 2008).

The industries with the greatest percentage of firms using LIFO include firms in the chemical industry and firms that manufacture industrial and farm equipment. Retailing firms use LIFO extensively. The industries with the smallest proportions of firms using LIFO include technology based firms which experience decreasing production costs such as computer and other electronic equipment (AICPA, 2008).

CONCLUDING COMMENTS

Despite the complex disruption of various countries, the global markets will continue to expand so that the adoption of global accounting standards such as IFRS will prevail. The current movement of China and India into IFRS adoption as well as Canada, Brazil, Mexico and Japan presents a strong advancement in this direction. The progressive interest in capital markets and global interest in a single set of strong accounting standards is now being confirmed. Opening up worldwide opportunities for investment and for investors to compare will provide growth around the world. US Multinational companies will be able to cut costs and produce more favorable financial statements. By adopting IFRS the US may help to jumpstart the economy and provide much needed job opportunities.

PREDICTING PREFERENCE WITH EMPIRICAL SURFACE INFORMATION UNDER BDT FRAMEWORK

Juyoung Kim, Sogang University

ABSTRACT

Economics assumes that preference is stable and coherent. However, Psychology says preference is constructed on the spot depending on the environment and the choice situation. This paper tries to build a new estimation method of preference or choice probability for a new product. The new method has three characteristics. Firstly, it utilizes pre-collected data of three alternative situations, two existing products and one decoy. This choice set has been commonly used in BDT research. It employs a non-parametric method to estimate response surface of choice probability. This method can capture a complex curvature of response surface. It also shows more rising and falling than existing BDT predictions. Finally, the new method estimates choice probability of a new product using the weighted sum of neighboring products' response estimates. The model needs to extend to more than four alternative situations and hopes to find out ways to extend to n alternative situation.

KEYWORDS: Behavioral Decision Theory, Marketing, Context Effect, Statistical Model

INTRODUCTION

Customer preference has been a core concept to explain customer choice behavior. There are two schools of thought regarding the preference (Hoeffler and Ariely, 1999). The Economic school is based on the assumption that consumers' choices signal their underlying need and wants, since preferences are revealed when consumers choose. Each consumer has stable and coherent preferences and maximizes those preferences via choice behavior (Rabin, 1998). Preference in Economics is considered as utility, and such choice behavior is called rational utility-maximization choice. On the other hand, Psychology believes that consumer choice looks more like irrational and is affected by status quo or reference products in his mind. That means each choice behavior is governed by preference that is constructed on the spot.

The constructive processing approach in Psychology assumes preferences are constructed on the basis of the task and context factors during choice or evaluation. Ever since Huber, Payne, and Puto (1982) have shown the attraction effect, the effect has been one of the main topics in consumer decision research. By adding an asymmetrically dominated alternative to a choice set, they have demonstrated that the newly added alternative helps the alternative that was the most similar, thereby violating the similarity hypothesis and regularity as well (Huber and Puto, 1983).

No one can say which school is correct or not in simple and definite terms. The reality might be in the middle, where consumers construct their preferences in a new category and stay there in a consistent way with more experience. Recently, there appears another argument that preference is stably inherent (Simonson, 2008). The inherent preference concept is similar to the thought of Economics school but it differs in a way how the preference builds. Contrasted with constructive preference formation, the inherent preference is constructed based on experience. The inherent preference is dormant until consumers discover and it is not influenced by 'forced' comparisons that were given in many BDT studies.

Marketing managers should be able to understand not only the origin and formation of preference, but also how to utilize it to make successful performances. Key components of successful marketing strategy

include prediction or estimation of sales and optimal design of product characteristics. In order to estimate sales of new products, marketing models usually employ models based on either statistical techniques or micro economic theory. Recently, there was a growing interest in structural models from the desire to test a variety of behavioral or economic theories with market data, and through advanced estimation methods, like MCMC (Chintagunta et al., 2006). However structural models demand much data and complex computational effort. Empirical models are often compared by their simple structure and information extracting efficiency (Liang, 2006). Therefore, it is important to balance the merits and demerits between structural/reduced-form modeling approaches.

In this paper, a model based on BDT theory is constructed to forecast choice probability for products while maintaining computational efficiency.

MODEL DEVELOPMENT

Existing BDT research builds theory with only a small number of alternatives. However, quantitative choice modelers need to test behavioral theories using secondary data which is collected in more realistic choice environments (Kivetz et al., 2008). The proposed model collects customer choice behavior data from three alternative sets and estimates a choice response surface from the choice behavior data, which is a smoothed preference surface function from empirical choice distribution on joint product attributes. Next, the model uses this empirical preference surface to estimate real choice under more than three alternatives. It assumes a choice from more than three alternatives is combination of multiple choices under three alternatives. For example, the choice of A among 4 alternatives, say A, B, C, and D, can be viewed as combination of series of three choices with 3 alternatives, like (A: A, B, C) (A: A, B, D) (A: A, C, D).

The proposed model consists of three parts: collecting data for preference surface with three alternatives, obtaining the preference surface using interpolation techniques, and applying preference surface to estimate choice probability of more than three alternatives.

DATA COLLECTION

As mentioned above, choice data with three alternatives is collected. Since Huber et. al. (1982), research has been done to identify the causes and mechanism for the context effect. Among them, relative position of decoy gets particular attention (Huber and Puto, 1983; Wedell and Pettibone, 1996; Pettibone and Wedell, 2007). Relative position is important when marketers decide the value of attributes for a new product. In the proposed model, data points of 121 positions of decoy are collected as shown in (Figure 1).

Product stimulus is selected as Green Tea pack and its attributes are the weight of the pack and the number of leaves in the pack. In green tea, the heavier weight, the higher value, and the larger number of leaves, the less value, since tiny leaves are younger and tastier than older large leaves. First, the subject evaluates two products on a 100-point scale in order to set a basic preference order. Then, subjects are asked to choose among three alternatives, which are two existing products (#2 and #3) and one decoy as in (Table 1). Each choice set has a different decoy, and the attribute values of decoys are shown in (Table 2). In total 1122 subjects made a choice from 121 choice sets and choice probability of decoy is calculated as proportion of decoy choice (Table 3).

Figure 1: Design of Attribute Space

	1	2	3	4	5	6	7	8	9	10	11
11	0	0	0	0	0						
10	0	0	0	0	0	0					
9	0	0	(#)	0	0	0	0				
8	0	0	0	0	0	0	0	0			
7	0	0	0	0	0	0	0	0	0		
6		0	0	0	0	0	0	0	0	0	
5			0	0	0	0	0	0	0	0	0
4				0	0	0	0	0	0	0	0
3					0	0	0	0	(#)	0	0
2						0	0	0	0	0	0
1							0	0	0	0	0

(#) represents location of two existing products. 0 shows locations for decoy. There are more locations between 0s. Horizontal and vertical axes are shown as relative scale.

Table 1: Samples of questionnaire

Green Tea Pack	Weight(g)	Number of leaves	Choice
No. 1	200	100	
No. 2	145	127	
No. 3	255	73	

Subject marks v on the last column of the alternative he prefers.

Table 2: Real values of decoy

Weight	109	113	127	138	145	163	164	182	188	200
	213	218	236	238	255	263	273	288	291	
Number of leaves	55	56	64	69	73	81	82	91	94	100
	106	109	118	119	127	131	136	144	145	

Subject sees a choice set with a decoy whose attribute value are chosen randomly from above lists following scheme of (Figure 1).

Table 3: Real proportion of choice

Weight	Number of leaves	% of choice
109	109	20
109	118	30
109	145	30
113	106	13
...
288	94	0
291	82	20
291	91	40

% of choice is based on choice among 8 to 10 subjects.

INTERPOLATION

In order to obtain the preference surface for choosing decoy in an attribute space, one can estimate a two-dimensional parametric function, such as quadratic function. However assuming the parametric function is not adequate since preference surface might not exhibit a smooth monotonic shape. Rather, it has a multimodal shape because a product near two existing products get positive or negative influences (e.g., similarity effect) and a product far from existing products might get negative influences (e.g., extreme

aversion effect). Therefore, a non-parametric interpolation or approximation technique is employed. This paper tried a spline function (Sandwell, 1987) and a radial basis function (Buhmann, 2003; Lukaszyk, 2004). A biharmonic spline function in MathLab turns out to be not as good as a radial basis function.

Radial basis functions are typically used to build up function approximations for non parametric function. As shown in equation (1), the approximating function $y(x)$ is represented as a sum of N radial basis functions, each associated with a different center c_i , and weighted by an appropriate coefficient w_i . The weights w_i is obtained by the function of Minkowski distance (Lukaszyk, 2004) as in equation (2).

$$y(x) = \sum_{i=1}^N w_i(\|x - c_i\|) \quad (1)$$

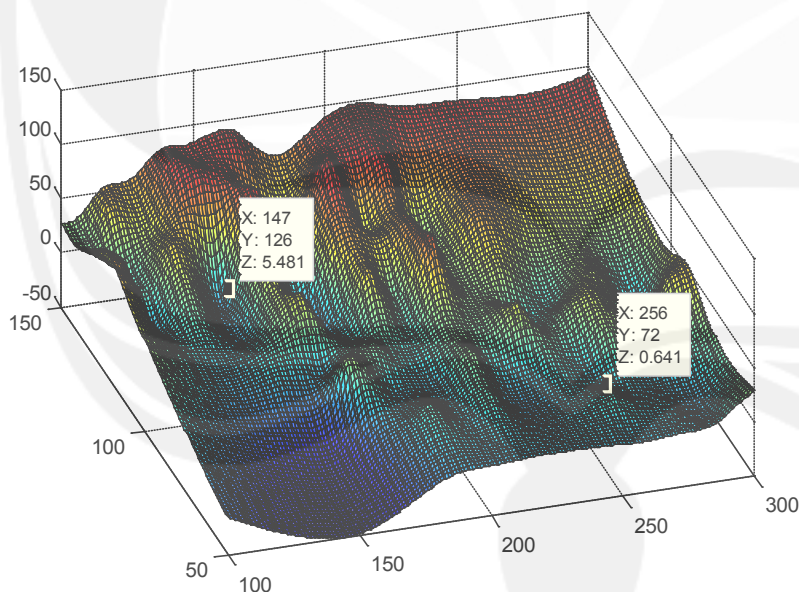

$$w_i(x) = f\left(\frac{1}{(d^{(p)}(x, c_i) + \delta^2)^3}\right) \quad (2)$$

Choice probability of the three alternatives situation, $P_3(x)$ is obtained by minimizing $K(x, P_3(x))$ as in equation (3). Here choice probability z_i and its location c_i is the data point gathered in data collection phase. At this step, one can get choice probability of decoy, $P_3(x)$, and $P_3(x)$ for any x in two attribute space spans a preference surface as in(Figure 2).

$$K(x, z) = \frac{1}{2} \sum_i w_i(x) (z - z_i)^2 \quad (3)$$

where x is location of decoy, z is choice probability at x , and z_k is proportion of choice at c_i

Figure 2: Estimated response function on attribute spac

Boxed positions tell locations for two existing product.

Prediction

The next step is to get the choice probability of an additional decoy that is added to the three alternatives situation. Notice that the choice data is gathered when there are three products, one is the decoy and the two others are existing products. A simple method to predict the choice probability of the fourth decoy is to use function (3). It assumes that there is no difference between three alternative situations and four alternative situations. However, preference surface that is estimated from three alternative situations,

fluctuates across the space and is quite different from the preference surface for two alternative that is assumed flat in micro economic theory. In a similar way, preference surface for four alternatives may be much different from (Figure 2). Therefore, this paper estimates choice probability of the fourth decoy by averaging values of three choice probabilities as in equation (4). In order to get three choice probabilities of different combinations of a, b, c, d from preference surface, one needs to rotate and stretch surface according to each combination. The estimates from equation (4) are compared with estimation from (3).

$$P4(a|a, b, c, d) = \frac{P3(a|a,b,c)+P3(a|a,b,d)+P3(a|a,c,d)}{3} \quad (4)$$

RESULTS

To test the model effectiveness, a new choice data is collected with new choice sets which adds a fourth decoy to three alternative situations in data collection phase. Ten different choice sets are made and the subject chooses one among four alternatives in each set. Choice proportions for 10 new alternatives are calculated from 100 subjects. (Table 4) shows MSEs between real choice proportions and estimates from (3), and estimates from (4). So, the estimation method based on equation (4), outperforms a simpler method, (3).

Table 4: Comparison between estimation methods

	#1	#2	#3	#4	#5	#6	#7	#8	#9	#10	MSE*
real value	17.5	25.7	24.1	22.1	22.4	27.4	28.3	22.8	27.4	24.3	
simple method (3)	10.0	40.0	60.0	0.0	20.0	20.0	50.0	20.0	20.0	30.0	267.1
proposed method (4)	15.8	18.1	24.7	28.4	23.9	22.5	21.5	24.1	20.4	23.7	23.0

*Mean Square Error is calculated from 10 new alternatives

Discussion

This paper proposes a new estimation method for a new product. The new method has three characteristics. Firstly, it utilizes pre-collected data of three alternative situations, two existing products and one decoy, which has been used in BDT. Secondly, it employs a non-parametric method, radial basis function to estimate preference surface of choice probability. This method can capture a complex curvature of preference surface. Finally, it estimates choice probability of a new product using the weighted sum of neighboring products' choice probability estimates.

Future research is needed for more applications of this model to other products. In addition, extension to more than four alternatives is necessary. Furthermore, one can search for better non-parametric functions than the radial basis function.

TESTING THE MEXICAN BANKING SAFETY NET FOR RISK-SHIFTING

Bernardo Quintanilla, Universidad Autónoma del Carmen

Jesús Téllez, Universidad Autónoma del Carmen

L. A. Wolfskill, Sam Houston State University

ABSTRACT

The 1994 Mexican banking crisis led to wholesale changes in the deposit insurance fund in the country's banking system. Poor lending decisions allowed banks to transfer risk to the fund, resulting in their capturing returns on performing loans, while limiting downside exposure when the fund covered losses on non-performing loans. Through a series of programs, the Mexican banking system now uses performance bonds in concert with the insurance fund. The bonds adjust in price based on the level of risk, and purport to measure the level of safety for the fund. We measure the effect of regulator actions by monitoring performance bond price levels over a 104-month period. Key bank ratios in the areas of liquidity, profitability, activity, and leverage were collected on the largest seven national banks, which control 87% of the capital in the banking system. Through a regression analysis, effects of these bank indicators demonstrate that, while not all are useful for predicting risk reduction and safety net viability, overall the banking regulators have incentivized lending institutions to reduce the occurrence of risk-shifting. This has led to a more stable banking system, and a more effective safety net for deposits.

KEYWORDS: Mexican banking sector, Financial safety net, FOBAPROA, FONAPRE, IPAB

INTRODUCTION

More than a decade has passed since the Mexican Tequila Crisis came to an end. At that time the banking sector experienced a fiscal shock that caused major trouble throughout the financial system. The existing safety net, the Banking Fund for the Protection of Savings (FOBAPROA), was depleted by the crisis. Unemployment and business bankruptcies increased the loan default rate to unsustainable levels. Many high-risk personal and business loans were made leading up to the crisis; some have related this to a weak system of loan qualification procedures. This fact made the banking sector vulnerable in 1995 when the crisis hit hardest. The causes of the banking crisis have been extensively documented by McQuerry (1999) and Calomiris (1999).

In 1982 the banking sector was nationalized due to a major financial crisis caused by many factors, including the collapse of oil prices, high levels of country indebtedness, and the devaluation of the Mexican peso. As a part of the nationalization process under the presidency of Miguel de la Madrid Hurtado (1982–1988), a trust fund was created to support the banks in times of financial stress. The fund was called Fund of Preventive Support for Banking Institutions (FONAPRE). FONAPRE, however, did not have any of the elements that constitute a modern safety net.

In 1991 the Mexican financial system was modernized and updated. As a part of that reconstruction, the banking sector was again privatized and a new deposit insurance fund was created to protect deposits. This deposit insurance fund was called FOBAPROA.

As a part of the modernization of the financial system, the government sold the banks. However, many of the banks were sold to private investors that did not have financial industry expertise. The new owners

engaged in a search of high returns to compensate for their investments and for the expenses made in the modernization of the banks. Through this, they increased bank risk prior to the crisis. The owners were able to shift the risk of bank failures from themselves to the national deposit insurance system. In this manner, they could capture higher returns while facing diminished risk.

After the Tequila Crisis, the Mexican government had the opportunity to redesign the safety net to prevent future disorders in the financial and banking sectors. The Institute for the Protection of Bank Deposits (IPAB) was developed to replace the largely ineffective FOBAPROA Fund. Special attention was given to the regulation and supervision of banks. Since 1998, IPAB has represented the Mexican safety net with the primary goal of maintaining financial system stability and avoiding bank-risk shifting.

A principal component of the IPAB's safety-net design is the incorporation of a surety bond. This bond is intended to introduce a method for real-time evaluation of the performance of regulators in disciplining banks to avoid risk-shifting. The performance bond was proposed by Kane (1995) when the Tequila Crisis was starting in Mexico. The goal banking safety nets is to prevent banks from shifting their risk to the deposit insurance fund. Bank risk-shifting promotes moral hazard when the deposit insurance fund must bailout banks with taxpayer money (Kareken and Wallace, 1978; Chari, 1989). Hovakimian and Kane (2000) tested for bank risk-shifting in commercial US banks, finding evidence that banks actually shifted their risk to the deposit insurance fund. Academics have proposed different ways of preventing risk-shifting.

The first attempt to deal with bank risk-shifting was the proposal by Gibson (1972) of a risk-based deposit insurance premium that would constrain banks from transferring risk to the deposit insurance fund. This proposal opened a wide field in deposit insurance research starting with Merton (1977), who used the Black-Scholes formula to compute risk-adjusted premiums for banks in the United States. Other academics have followed Merton's work (e.g. Acharya & Dreyfus, 1989; Marcus & Shaked, 1984; Pennachi, 1987; and Ronn & Verma, 1986).

Besides risk-adjusted premiums, regulation has been proffered as a means of ensuring discipline in the behavior of banks. Kane's (2009) posture is that efficient regulation must constrain banks from transferring their risks to the insurance fund. To him, regulators are the key ingredient to the proper functioning of a financial safety net. However, regulators can undermine the goals of the safety net and engage in practices that lead to problem situations of the deposit insurance fund (Kane, 1989). Kane (1995) proposed the performance bond as a way of measuring regulator performance. In this manner, regulators will have an ongoing indicator that evaluates their work, which should result in a better capitalized and risk-controlled banking sector.

The objective of this research is to test for risk-shifting behavior in the Mexican banking industry since the IPAB became operational. The question this paper intends to answer is whether IPAB has been able to constrain Mexican banks from transferring their risks to the deposit insurance fund. The Tequila Crisis experience, the collapse of FOBAPROA, and the banking sector crash during the decade of the 1990s should be strong reasons to persuade Mexican banks and IPAB regulators to avoid bank risk-shifting.

The IPAB has decided not to implement system using insurance premiums adjusted for bank-risk; instead it has bet that regulation is enough to discipline banks who practice risk-shifting, and incentivize them to make proper decisions regarding the acceptance of risk. As a component of the new architecture, a performance bond was introduced as part of the regulation and supervision efforts of IPAB (Kane, 1995). A performance bond measures the effectiveness of regulators in constraining bank risk-shifting. When investors consider the safety net organization's debt to be risky, the premium on these bonds will increase, causing the bond price to fall. In contrast, if regulators are performing well and banks are not tending to shift risk to the deposit insurance fund, the market will perceive the institution's debt to be

low-risk and hence show a higher bond price. Therefore, the performance bond's price acts as an immediate indicator of the health of the deposit insurance fund and its ability to prevent a banking crisis. We should expect a rise in the bond price as the market perceives regulators to be successfully constraining bank risk-shifting. In other words, the price rises with a decrease in bank risk, and falls with an increase in bank risk. Regulators will have the incentive of preventing banks from increasing their risks, consequently driving the deposit insurance fund to a healthier level.

METHODOLOGY

We propose a regression-based analysis of the relationship between bond prices and the indicators of banking system performance. The dependent variable is the bond price. IPAB issues a performance bond called the Bond for the Protection of Savings (in Spanish, BPA). This bond captures the welfare of the deposit insurance fund managed by IPAB. BPA is the price for which the bond i is offered at time t . In relation to the independent variables, we use bank risk depicted in the CAMEL rating (Martinez and Schmukler, 2001; Thiratanapong, 2007). Because not every Mexican bank is listed in the Mexican stock exchange, balance sheet data (available on all banks) is preferred over market data. Additionally, balance sheet information is updated on a monthly basis rather than quarterly, making data more reliable and a better current reflection of the actual bank situation. When taking positions in the stock market, investors consider not only future outcomes but also past bank financial history through the study of published financial statements.

We measure the reaction of BPA prices to bank risk-taking with the following reduced form equation:

$$BPA\ price = \mu_i + \beta' Bank\ Fundamentals_{i,t-1} + \omega_{i,t} \quad (1)$$

To take into account bank fixed effects we use μ as the constant in the model, Bank Fundamentals is a vector of risk ratios in bank balance sheets, and $\omega(i,t)$ is the stochastic error term for bank i in month t . For Bank Fundamentals, a series of financial ratios are considered. The first element is liquidity, as the lack of liquidity increases bank risk. To account for liquidity we use the ratio of availabilities to total assets (ATA), and the ratio of investment in portfolio assets to total assets (IPATA). The second element is profitability. An unprofitable bank may engage in risk-taking practices to increase return. The two ratios considered are return on assets (ROA) and return on equity (ROE). The third term is activity to account for the fact that a bank must charge to have income. The less it charges, the riskier the bank becomes. To account for activity the ratio non-performing loans to total loans (NOLT) and income to total assets (ITA) are considered. Finally we test the total debt to equity ratio (TODE), which accounts for a bank's leverage. The more debt to equity a bank has, the riskier it becomes.

When overall bank risk decreases, the deposit insurance fund becomes safer. This is shown by the performance bond becoming safer, resulting in an increase in its price. This will then cause a reduction in cost for the insurance corporation. So a reduction in overall bank risk must translate into an increase in the bond price, which would imply a negative sign on the regression coefficient. If a bank lacks liquid assets in relation to its debts it becomes riskier. For this case, an increase in liquidity will reduce risk, producing a positive sign on the regression coefficient given the increase in the bond's price. An increase in ATA and IPATA would also signify a reduction in risk, and their coefficients would show a positive sign. On the other hand, we expect that an increase in profitability will generate a positive sign on the coefficient. An increase in profitability would relax the pressure from the bank to assume higher levels of risk. Hence, an increase in ROE and ROA would mean a reduction in risk, and therefore a safer deposit insurance fund. We expect a positive sign in these two coefficients. When testing activity levels we would expect that an increase in activity would reduce the ratio of non-performing loans to total loans (NOLT) and increase the ratio of income to total assets (ITA). If NOLT decreases and ITA increases, we expect a reduction in risk, which would then generate an increase in the price of the bond. Hence, NOLT

would produce a negative sign and ITA a positive sign in the regression coefficient. Finally, an increase in total debt to equity (TODE) would result in higher risk demonstrating greater moral hazard to the insurance fund. We therefore expect a reduction in this ratio and a subsequent positive sign in the coefficient.

Data

Mexico restructured its financial system in 1991 and a new law was enacted. From that year until now, 40 banks make up the Mexican banking system. The data is obtained from an IPAB internal database that covers financial data for the 40 banks. Table I shows some descriptive data for banks in the system. Although the overall system comprises 40 banks, the seven largest banks control 87% of the total capital in the Mexican banking system. Therefore, this research limits data to those entities. The monthly data cover the period from December 2000 to August 2009, for a total of 104 months.

Table 1: Market Participation of Banks in the Mexican Banking System

	Bank	Beginning year	Equity*	Market Participation**
1	Banamex Citigroup	1991	\$ 123,374.54	25.77%

RESULTS

Given a robust model to test for bank risk-shifting, we find strong results that account for a reduction of risk-shifting from Mexican banks to the IPAB deposit insurance fund. According to Table II, Mexican banks have reduced the transfer of risk to the deposit insurance fund. The independent variables are discussed below.

Availabilities to total assets (ATA) show a positive sign in accordance with the hypothesis that an increase in liquidity increases the safety of the insurance fund, driving risk down. Even though there is no evidence that this ratio is statistically significant from zero. The other liquidity measure is investment in portfolio assets to total assets (IPATA), but this variable shows a different sign that what it was expected. A negative sign in IPATA means that a reduction in liquidity, in the form of investment in portfolio assets leads to an increase in the safety of the deposit insurance fund. The best explanation with this difference in expectations is that portfolio investments are risky in their own. Hence, the more the portfolio positions increase, the riskier the bank turns and this affects the safety of the deposit insurance fund. But neither ATA nor IPATA are statistically significant, reducing their explanation power.

Table 2: OLS Regression Results Relating Bank Risk Ratios to the IPAB Performance Bond Price

Ordinary least squares regressions relating bank risk ratios to the IPAB performance bond - BPA. IPAB stands for Institute for the Protection of Savings in Banks and BPA stands for Savings Protection Bond. ATA is availabilities to total assets, IPATA is investment in portfolio assets to total assets, ROA is return on assets, ROE is return on equity, TODE is total debt to equity, NOLT is non performance loans to total loans and ITA is income to total assets. All of these independent variables make the vector of Bank Fundamentals that account for bank risk. Data covers the period from 2000:12 to 2009:7 in a monthly basis.

	Constant	ATA	IPATA	ROA	ROE	TODE	NOLT	ITA
Regression	100.136*** (112.9)	1.03162 (0.2892)	-0.1671 (-0.08211)	24.4974*** (4.437)	-1.62802*** (-4.863)	-0.0741*** (-6.301)	-13.1316*** (-4.248)	11.6941 (0.6625)
Correlation		0.308	0.6361	0.0227	-0.4451	-0.808	-0.789	-0.03
R ²	0.827163							
Sum of Squares	11.82008							
No. Of Observations	728							

Coefficient t-statistics are reported in parenthesis. *** Indicate values significantly different from zero at the 1% level.

Concerning profitability measures, both ROA and ROE are statistically significant. However, ROA shows the expected sign in the coefficient, while ROE does not. We have said that an increase in profitability will stop banks from taking greater risks, reducing the pressure on the insurance fund. ROA has the expected sign, showing that if the profitability over assets increases, risk lessens and hence, the safety of the insurance fund is not diminished. While ROA expresses the profitability of the entire bank (all sources of funding), ROE only shows the profitability of bank equity. This is the explanation of the negative sign in the coefficient of regression for ROE. In a time when regulators are appointing for an increase in equity and a reduction of bank debt to improve capital adequacy, return on equity will drop. ROE increases when equity is low, debt is high and return divides a lower equity. Hence, lower equity will produce high ROE ratios, but increased equity will produce low ROE measures.

These results confirm the view of a retrench in risk-shifting from banks to the deposit insurance fund. They also suggest that there is a systematic intention in stepping back from highly leveraged banks to a better capitalized banking system. Mexico is pushing to create a strong banking system through regulation, and this regulation has leverage reduction as its primary goal.

Total debt to equity (TODE) shows a negative sign, in accordance with the hypothesis. If leverage decreases, then risk also decreases, leading to a safer deposit insurance fund. TODE is statistically significant at the 1% level. This reduction in leverage goes in parallel with the increase in ROE. Together these two variables show the systematic effort of regulators in reducing leverage from the Mexican banking industry, driving the nation's financial system to a stronger and safer level. From this result one can conclude that Mexico is taking a serious stance on the Basel II Accord on Bank Supervision.

Is also important to note that this positive result has been achieved through regulation and supervision (Kane, 1989; Kane, 2009) and not with risk adjusted premiums, as has been proposed in the past (Acharya

& Drayfus, 1989; Gibson, 1972; Marcus & Shaked, 1984; Merton, 1977; Pennacchi, 1987; Ronn & Verma, 1986). Mexico charges one fixed percentage monthly premium to every bank in the system, based on the level of their deposits for the specified month.

Activity is measured by non performing loans to total loans (NOLT), and income to total assets (ITA). The argument behind these two ratios is that if a bank improves activity, it will have less probability of default and its risk will be lower. Although the argument seems reasonable, the sign for ITA is not in line with it and just NOLT applies to the premise. Even though both NOLT and ITA correlation signs are negative, just NOLT regression coefficient has the negative sign and is statistically significant at the 1% level. ITA coefficient of regression has a positive sign and is not statistically significant.

An increase in non performing debts to total debts increases the risk of a bank, for its clients are defaulting on their loans. If this risk increases, the deposit insurance fund could be threatened. If NOLT is reduced then risk lessens and the deposit insurance fund is safer. But the same applies if NOLT increases. An increase in NOLT will drive risk high and lessen the safety of the deposit insurance fund. So, in both cases we would have a negative sign.

In the Mexican case, as shown in Figure I, NOLT has declined significantly in the period of study. That way we can confirm that the reduction in NOLT has lowered bank risk and hence, led the deposit insurance fund to a safer level. The confidence level is high for this independent variable, so we can say that a reduction in NOLT is a good predictor of lower deposit insurance risk. It should be pointed out, that in the 2008–2009 world financial crisis, NOLT increased, but not to a hazardous level. Even with this marginal increase in NOLT, BPAs have shown strong pricing, which indicates that the Mexican safety net is in a very safe position.

Figure 1: Non-performing Loans to Totals Loans (NOLT) Jan 2001 – Aug 2009

This figure shows the ratio of non-performing loans to total loans for the 104 month period from January, 2001 through August, 2009. Data were extracted from published bank monthly financial documents, rather than the quarterly Mexican Federal Government reports.

Finally, income to total assets is not statistically significant even though it shows the expected positive sign. Increased bank income reduces bank risk, which leads to an increase in the safety of the insurance fund. However, the lack of significance indicates that bank income is not a driving variable for the state of the deposit insurance fund.

CONCLUSIONS

The Mexican case is a good scenario in regards to bank risk shifting. The level of bank risk is trending in the direction of lower risk, and the insurance fund shows a high degree of healthiness. Even in the middle of the world financial crisis, Mexican banks have had a downward trend in the risk they pose to the deposit insurance fund of IPAB. Of particular concern, however, is to know if this downtrend in risk is the product of managerial prudence or whether it is driven by the discipline imposed by regulators.

The Tequila Crisis provides both managers and regulators a common background, and both of them could be, in their own proper way, preventing the banks from falling into the same trap as in 1995. It is therefore difficult to determine whether the actions of regulators alone are causing the observed discipline in banks, thus stopping them from engaging in risky activities.

It has also been shown in this paper that the performance bond is a good predictor of the health of the deposit insurance fund. The bonds for the protection of savings (BPAs) issued by IPAB are a very good thermometer to identify risk-shifting from banks to the deposit insurance fund. A decrease in the price of the BPA is a signal that regulators must reinforce discipline.

DEVELOPMENTS IN THE OIL MARKET: IMPLICATIONS FOR FUTURE PRICES

Paul R. Kutasovic, New York Institute of Technology
William Lawrence, New York Institute of Technology

ABSTRACT

The rise in oil prices in 2009 and 2010 surprised many analysts given the sluggish rate of economic growth in the advanced economies. This highlights the changes occurring in the global oil market. This study examines trends in the oil market and provides an overview of the issues surrounding peak oil. Peak oil refers to the point at which oil production begins to decline. Analysis of global oil reserve data predicts that oil production will peak anywhere from 2014 to 2040. The peaking of production suggests that oil prices will face upward pressure due to declining production capacity as oil fields mature, shifting production toward lower quality oil costing more to produce and a growing geopolitical risk as global production moves increasingly to OPEC and the former Soviet Union. A major change is also occurring in the global composition of oil consumption. Virtually all future growth in oil consumption will come from the developing countries, especially China. Propelling growth in oil demand in these countries will be a large expansion of motor vehicles sales due to increasing per capita income. Rising demand in the developing countries will put upward pressure on prices even if growth remains sluggish in the developed countries.

KEYWORDS: Peak Oil, Hubbert's Curve, Oil Demand, Oil Supply, Oil Reserves

INTRODUCTION

Over the last decade, oil has become a global commodity. Oil prices are now determined by developments in the global economy with the US playing a much smaller role. It is in the global market that significant changes are now occurring in supply and demand for oil, which will have a large impact on the future price of oil. Oil prices, as measured by West Texas Intermediate (WTI), rose in 2009 and in the first half of 2010 despite sluggish growth in the developed economies of Europe, Japan and the US. These relatively high prices have raised concerns that the world is running out of oil and that oil production will soon peak. Numerous doomsday predictions have been made by oil professionals at various times over the past two decades and have failed to come to fruition. Yet the evidence is growing that these pessimistic forecasts may be right this time and that the era of cheap energy may be over. What is surprising is that despite the critical importance of the issue of peak oil, the topic has not been more widely discussed. This article provides an overview of the issue of peak oil and looks at recent and projected trends in the oil market. The study is organized as follows: section 2 provides a historic review of oil prices, sections 3 and 4 discuss the issues surrounding peak oil, section 5 examines the changing composition of the global demand for oil, section 6 examines production trends, section 7 looks at the role of price elasticity. The paper ends with conclusions and implications for oil prices in section 8.

LITERATURE REVIEW

History of Oil Prices

Given the critical role played by crude oil, events in the oil market have a major impact on the overall economy. Over the past 50 years, oil prices have moved in a wide range but lacked any meaningful trend. In the years 1945 to 1972, oil prices, as measured by WTI, were essentially flat and ranged from \$2 to \$3

a barrel. Then, the world economy faced two major oil shocks in 1973-74 and 1979-80, both of which were largely due to cutbacks in OPEC production. In 1973-74, oil prices rose from \$2 to \$3 a barrel to about \$11 to \$12 a barrel and then in 1979-1980 they spiked up again to about \$39 a barrel. During both oil shocks, the US and much of the global economy moved into a recession and unemployment rates rose sharply.

Oil prices peaked in April 1980 at \$39.50 a barrel and then steadily declined for almost 20 years until they bottomed out in December 1998 at a price of \$11.28 barrel. This 20-year period of decline in prices set the stage for the current price surge. Investments in the oil industry became unprofitable and there was no longer much of an incentive for consumers to conserve energy. As a result, oil companies cut back on their capital budgets and oil rig counts and drilling activity fell sharply. The relatively low price of oil at the pump encouraged consumers to buy less fuel-efficient vehicles and bigger homes. Crude prices starting edging up again at the end of the 1990's but the upward price spike did not become noticeably pronounced until late in 2003, with oil prices rising sharply between 2003 and 2008 and reaching a peak of over \$130 a barrel in July of 2008.

The deepest and longest global recession in the post-World War II period, that began in December 2007 and lasted through the middle of 2009, dramatically reduced oil demand and oil prices. Prices for WTI fell from over \$130 a barrel in the summer of 2008 to a low of \$31 in December of 2008. Despite a sluggish recovery in the advanced countries and record levels of inventories, oil prices rose throughout 2009 and reached a level of over \$80 a barrel by the fall of 2010. Oil prices are now at levels that are well above those experienced prior to the global recession. Oil prices (WTI) averaged around \$56 a barrel in 2005 and \$66 a barrel in 2006 at a time when the global economy was expanding at a rapid rate. The question is why are oil prices so high given the sluggish rate of growth in the overall global economy.

Are We Running Out of Oil? Peak Oil

No one expects the global economy to run out of oil anytime soon. The concern is that the upward trend in oil production, that has been evident over the last century, will reach a point of maximum production and then decline. The question is when will global oil production peak and how will it affect the global economy. The date when peak production occurs is a source of much debate among participants in the energy market. Peak oil refers to the point at which a given oil field reaches peak production, after which production will fall no matter how many new wells are drilled. The ideas underlying peak oil were developed by a Shell geologist, M. King Hubbert (Hubbert, 1956). Back in 1956, Hubbert reviewed the production history of a number of oil fields in the US. Hubbert predicted that US oil production would peak in the 1970s, and he called the top within a few months. Since then, crude oil production has been declining in the US despite the large discovery of oil made on the North Slope of Alaska in the late 1970s. Applying the same methods to global production, proponents of Hubbert predict that global production should peak in the next few years. Most of today's peakists base their forecast on Hubbert's curve, which is a bell shaped curve representing exponential growth and decline in production (Campbell, 2003 and Deffeyes, 2002 and 2005). Hubbert's curve shows that oil production rises and falls as a direct function of remaining oil reserves. In other words, production can increase until the cumulative production uses up half the total reserves in the field and then production begins to decline. What is critical in the analysis is the half way point (Campbell, 2003). Once half of the oil is used up we have reached a point of no return and production will decline no matter how much new technology is applied or additional drilling occurs.

ANALYSIS OF GLOBAL OIL RESERVES

The key to Hubbert's peak, and the time at which production begins to decline, is the level of global oil reserves. We have been consuming oil for over 100 years and have over this period pumped out approximately 1 trillion barrels of oil. Current production uses about 31 billion barrels per year. How much oil is left is thus the key question. If we have extracted half of all the oil that has ever existed, we

are, by most definitions of the issue, at or past the peak. Obviously, a larger reserve base implies a later peak date than a smaller one. Here is where there is considerable debate among geologists and oil analysts. The peak oil debate revolves around four important issues regarding oil reserves:

1. Amount of reserves left to produce
2. Field-by-field analysis
3. Quality of remaining reserves
4. Geographic distribution of remaining reserves

Amount of Oil

On the issue of the amount of oil remaining, no geologist or analyst knows exactly how much oil exists under the earth or how much can be extracted. Instead, all the reported numbers are essentially informed estimates based on probabilities. In fact, reserve definitions vary by country making comparisons between them essentially useless. Reserves in a given oil field are classified in a number of categories. The news media nearly always use the proven reserve figures and omit other categories. By definition, proven reserves are those that can be recovered with reasonable certainty using current technology and current prices. These are often classified as P-90 reserves since there is a 90% probability they will be extracted over the life of the field.

The oil field will also have additional quantities of probable and possible reserves. These are recoverable with a probability of over 50% and under 50%, respectively, from the estimated total volume of oil-in-place in the field. The probable and possible reserves are undeveloped since they are unprofitable to produce at current prices and technology.

Finally, there are unconventional reserves, which include heavy oils, tar sands and oil shale. Processing these reserves is expensive and requires different production methods. While some consider recoverable reserves to be fixed by geology, in reality their accessibility as an energy source is more dictated by technology and oil prices changes. *In other words, economics is as important as geology in coming up with reserve estimates since a proven reserve is one that can be economically developed.*

As technology improves and prices increase, probable and possible reserves are reclassified as proven. This process often leads to a situation where the level of proven reserves in an oil field trend upwards over time, in spite of the ongoing extraction of oil from the field. This will occur as the rate of extraction is offset by the conversion of probable and possible reserves to the category of proven. In addition, proven, probable and possible reserves represent only a portion of the oil in place in a given field since it is impossible to recover all of the oil and gas. The recovery factor (reserves to oil in place) may change over time in response to improved technology and higher prices.

Thus, the world supply of oil is not only determined by geology but by an interplay of economics, technology and most critically important in today's environment, geopolitics. Given the above, the worry is not that we will soon run of oil in a direct sense. The consensus among most geologists is that we still have about 7 to 9 trillion barrels of oil-in-place left. The question is how many of those barrels can be recovered. And, what will be the cost? Most of the advocates of peak oil believe about 1 trillion barrels of oil are left. If true, that will put us at or beyond the peak since about 1 trillion barrels have been already produced and production must therefore decline. Other geologists estimate ultimately recoverable conventional reserves as high as 3 trillion barrels with another 2 trillion barrels of unconventional oil. Table 1 provides an estimate of reserves as defined by various sources.

Table 1: Estimate of Oil Reserves (Trillions of barrels)

	Ultimately Recoverable Reserves
Campbell	1.0
Exxon	3.2
International Energy Agency	1.3
Nashawi Kuwait University	1.2
Oil and Gas Journal	1.3
International Energy Agency	1.3
United States Geological Service	2.3

This Table shows estimates of global oil reserves excluding unconventional reserves from C. Campbell(2003), Exxon 2009 Annual Report, International Energy Agency (2009), Nashawi (2010), Oil and Gas Journal (2010), and United States Geological Survey (2000).

Of course, the higher reserve figures yield a much later oil peak, with the USGS numbers suggesting a peak around 2037. The recent study (Nashawi, 2010) by researchers at Kuwait University estimated that that the world could ultimately produce 2,140 billion barrels of oil, with 1,161 billion barrels remaining to be produced at the end of 2005. This suggests a peaking of production in 2014.

Reviewing the other reserve estimates suggests that the claim that oil production has already peaked seems premature. If the more optimistic assessments hold up, we should have at least another decade or two of rising production especially if production from unconventional reserves increases as expected. But even assuming that the peak occurs as late as 2040, a crisis is in the making and preparation must soon begin for the difficult adjustment process of finding reasonable options and alternative energy sources. What is important to understand is that the level of reserves available is not the only factor to consider when trying creating an effective long-term global energy strategy and oversimplifies the peak oil argument.

Quality of oil

The quality of the oil reserves is also critical. This is so because of its impact on the cost of extracting and refining oil. The highest quality, light sweet crude, is easy to find and cheapest to produce and refine. But, most experts accept the fact that this quality of crude has already been largely discovered and as a viable energy source is set to decline. Replacing it will be one of several lower, heavier grades of crude (often containing sulfur) that are more expensive to extract and refine. Compounding the problem, it is getting more expensive to find new deposits worldwide (such as deep sea drilling) and unconventional energy sources are expensive to produce and refine. This all suggests that oil prices cannot help but trend upward in the years ahead.

Geographic Distribution

Finally, most of the world's proven reserves are found in the OPEC region. The Middle East accounts for over 55% of the world's reserves based on 2008 data from the International Energy Agency (IEA) and 56% of the reserves based on data from the Oil and Gas Journal (2010). The rest of OPEC has 15% of the reserves with Venezuela and Nigeria containing 6% and 2% of the reserves, respectively. Most of these OPEC reserves are found in countries hostile to the US and with high geopolitical risk. Non-OPEC reserves account for only 30 percent of the world total with proven reserves in the US estimated at 2% of total. Exploration, development and production costs are much higher in the non-OPEC region. Most of the fields in the non-OPEC region are mature and in decline.

Field-by-field Analysis

The rate of change in output from maturing oil fields is critical in assessing the point of peak production. The International Energy Agency (IEA, 2008, 2009) has compiled a database containing production profiles on the world's 798 largest oil fields. This database includes all 54 of the super-giant fields (proven reserves greater than 5 billion barrels) and 263 of the 320 giant fields (proven reserves greater than 500 million barrels). The bulk of global oil production comes from a small number of super-giant and giant fields. The IEA (2008 and 2009) shows that the 20 largest fields in the world produce over 19 mbd or about a quarter of the oil produced in 2008. In addition, the percentage of global production from the super-giant and giant fields has grown as a share of total production and accounted for about 60% of global production in 2008 (IEA, 2008 and 2009) compared to around 56% in 1985.

The IEA (2008 and 2009) in an intensive field-by-field study found that 580 of the 798 largest oil fields are at peak or past peak in production. Output in 2008 at 16 of the 20 largest oil fields was below their historic peak. Most of the world's largest fields have been in operation for many years and few large discoveries have been made in recent years except for in high cost deep offshore waters.

The average annual rate of decline in these 580 fields is 5.1%. This is equal to 3.6 million barrels per day (mbd), based on 2008 levels of global production. The rate of decline can be slowed through the deployment of new secondary and enhanced recovery techniques but this is extremely capital intensive and significantly increases the cost of producing a barrel of oil. The problem is that once production exceeds its peak it is difficult to slow the rate of decline even if large investments are made. In fact, peak oil analysis suggests that the rate of decline will accelerate once oilfields exceed peak production. A key implication of the analysis is that future supply must not only meet increases in demand but also offset the loss of capacity from existing fields as they mature. In fact, the loss of capacity will have a more important impact on future supply needs than the increase in demand.

In summary, what the oil reserve data suggests is that we are not running out of oil per se but that we are running out of high quality oil that is cheap to produce and mostly located in countries with high geopolitical risk.

CHANGING COMPOSITION OF GLOBAL DEMAND

Perhaps the most important development on the demand side of the oil market is the rising importance of the emerging market economies. Tables 2 and 3 provide historic consumption data for the year 1980 to 2007 and projections out to 2030. The following section presents a review of the historic data and then looks at a projection of oil demand.

Historic Data

What is evident in the data is that the composition of global oil demand is rapidly changing. The mature economies in the US, Europe and Japan still account for over half of global consumption but their share are declining. The share of oil consumption in the advanced countries has declined from 62% in 1980 to 52.4 % in 2007. What is occurring is that is that most of the growth in the demand for oil is coming from the emerging/developing countries. Due to a combination of rapid economic growth and an expanding manufacturing and transport sector, the emerging economies are quickly gaining a larger share of global oil consumption. Growth in manufacturing and vehicle ownership are the most important drivers of oil demand in these countries.

It is not surprising that the booming emerging economies have posted robust oil demand. This is especially true of China and India with GDP growing at annual rates of around 10% and 8%, respectively over the last 5 years, with no reasonable expectation of a slowdown. From the historic oil consumption data provided in Tables 2 and 3, the following observations are made:

- Oil consumption was very responsive to the price hikes in the 1970s as there was virtually no growth in global oil demand between 1980 and 1990. Oil demand rose from 64.8 million barrels per day (mbd) in 1980 to only 67.0 mbd in 1990. Demand in the mature economies declined by 400,000 mbd over this 10 year period.
- Between 1990 and 2000, global oil demand rose by 9.3 mbd as economic growth worldwide was relatively strong. Despite the robust increase in demand, both nominal and inflation-adjusted oil prices declined through most of the decade and bottomed out in late 1998.
- What was striking in the oil market in the decade of the 1990s was the sharp contraction in oil consumption in the former Soviet Union from 8.1 mbd in 1990 to 4.4 mbd in 2000.
- Global consumption for oil grew at a rapid pace in the years between 2000 and 2007. Between 2000 and 2007, demand for oil increased by 9.8 mbd from a level of 76.3 mbd in 2000 to a level of 86.1 mbd in 2007.
- Most of growth in oil demand over the last seven years has been due to growth in consumption in the emerging economies. Between 2000 and 2007, oil consumption in the emerging economies rose by 8.3 mbd accounting for 84.7% of the incremental growth in global demand (9.8 mbd) over this period.

Table 2 Global Oil Consumption by Region (Millions of Barrels Per Day)

	1980	1990	2000	2007	2015	2030
<u>Mature Economies</u>						
US	17.4	17.0	19.3	20.6	20.2	21.5
Europe	14.6	14.2	14.3	14.1	14.0	13.6
Japan	4.9	5.3	5.4	5.0	4.2	4.2
Other*	3.3	3.4	5.4	5.4	5.3	5.8
Total Mature	40.3	39.9	44.3	45.1	43.7	45.1
Former Soviet Union	9.5	8.1	4.4	5.1	4.9	5.1
<u>Emerging Economies</u>						
China	2.0	2.3	4.7	7.6	10.0	15.3
India	0.7	1.2	2.3	2.8	3.2	4.4
Rest of Asia	4.0	4.1	7.1	9.6	9.1	11.1
Latin America	5.0	5.6	6.6	6.9	7.1	9.5
Middle East	2.0	3.7	4.6	5.9	7.2	9.2
Africa	1.3	2.1	2.3	3.1	3.5	4.2
Total Emerging	15.0	19.0	27.6	35.9	40.1	53.7
Total World	64.8	67.0	76.3	86.1	88.7	103.9

This Table shows the historic change in oil consumption making the distinction between advanced and emerging economies. Historic data from 2000-2007 is examined as well as projections through 2030. Other consumption in the Table is oil demand in Canada, Korea and Australia/New Zealand. The data is from the US Energy Information Administration (EIA) (2010) and from British Petroleum. (2010).

- China alone increased its consumption by 2.9 million barrels per day between 2000 and 2007, more than the combined increase of 0.8 million barrels per day in the US, Europe and Japan.
- Demand in India and the rest of Asia rose by 3 mad in the period 2000-2007.
- Changes in the price of oil are largely determined by the incremental growth in demand. The emerging economies, given their rapidly expanding level of consumption, will increasingly account for most of the overall incremental demand growth for oil and thus become one of the main determinants of the price of oil.

Table 3 Change in Demand By Region (Millions of Barrels Per Day)

	Change in Consumption 2000-2007 (MBD)	Projected Change in Consumption 2007-2030 (MBD)
Advanced Economies		
US	1.3	0.9
Europe	-0.2	-0.5
Japan	-0.4	-0.8
Other	0.0	0.4
Total Mature	0.8	0.0
Former Soviet Union	0.7	0.0
Emerging Economies		
China	2.9	7.7
India	0.5	1.6
Rest of Asia	2.5	1.5
Latin America	0.3	2.6
Middle east	1.3	3.3
Africa	0.8	1.1
Total Emerging	8.3	17.8
Total World	9.8	17.8

This Table shows the historic change in oil consumption making the distinction between advanced and emerging economies. Historic data from 2000-2007 is examined as well as projection by the EIA through 2030. Other consumption in the Table is oil demand in Canada, Korea and Australia/New Zealand. The data is from the US Energy Information Administration (EIA) (2010) and from British Petroleum. (2010).

Demand Projections

Global oil demand is projected to increase from a level of 86.1 mbd in 2007 to an estimated 88.7 mbd in 2015 and an estimated 103.9 mbd in 2030 based on projections made by the US Department of Energy (2010). The US Energy Information Administration (EIA) (2010) forecast is essentially a consensus forecast and is consistent with projections made by the International Energy Agency (IEA) and most private analysts.

Oil consumption in the emerging economies will increase by an estimated 17.8 mbd between 2007 and 2030 and account for all of the growth in global oil consumption. No growth in oil consumption is expected in the advanced economies over this period of time. China alone will increase consumption by 7.7 mbd between 2007 and 2030 accounting for over 43% of the global increase in oil demand.

Growing vehicle ownership will play a key role in the growth in oil demand. Of the projected increase in oil use over the 2007 to 2030 period, 61 percent occurs in the transportation sector. Statistical studies by EIA (2010) and IEA (2008 and 2009) show that demand for motor vehicles rises rapidly once per capita income exceeds \$3,000. A growing portion of the population in China and India are now approaching this threshold level of per capita income and thus both countries should experience a significant increase in their rates of motor vehicle ownership. In summary, the growing absolute size and importance of demand in the emerging economies will have a major impact on price trends in the oil market.

PRODUCTION: NON-OPEC SUPPLY

We now look at the non-OPEC supply side of the oil market. The growth in non-OPEC oil supplies played a significant role in the erosion of OPEC's market share over the past three decades. Growth in production occurred in Alaska, the North Sea, South America and Mexico and recently in Africa. Many of these oil fields are now aging and production is expected to decline. *It is non-OPEC supply that will experience the impact of peak oil.*

Table 4 Non-OPEC Production (Millions of Barrels Per Day)

	2000	2007	2015	2030		
			DOE	IEA	DOE	IEA
US/Canada	11.1	11.9	14.1	12.5	16.0	16.2
Mexico	3.5	3.4	2.1	2.1	1.6	1.7
Europe	5.8	5.4	3.5	3.4	2.9	2.2
Former Soviet Union	10.7	12.3	13.1	14.3	16.4	16.6
Africa	2.8	2.6	2.9	2.1	3.5	1.9
Latin America	3.6	4.3	5.9	5.1	8.9	4.6
Rest of world	7.6	7.6	9.7	8.1	10.7	7.7
Total Non-OPEC	46.2	50.4	51.3	47.6	60.0	50.9
Total less Former Soviet Union	35.5	38.1	38.2	33.3	43.6	34.3

This Table shows historic production data from non-OPEC countries from 200 to 2007. It also looks at EIA and IEA projection through 2030. The historic data is from the EIA and IEA.

Table 4 provides supply projection for Non-OPEC countries to the year 2030 based on estimates by the IEA and the EIA. Both projections are similar for 2015 and call for a production increase from 50.4 mbd in 2007 to a range of 47.6 MBD to 51.3 mbd in 2015. The IEA then expects production to stay essentially flat through 2030 as the effects of peak oil become evident. The EIA is more optimistic and projects production will increase to 60.0 mbd. Both forecasts assume that declines in conventional oil production are offset by:

1. Increases in production in the former Soviet Union
2. Gains in nonconventional production

The EIA assumes significantly more growth in nonconventional production in comparison to the IEA. Oil markets will be adversely impacted if either of the above two assumptions does not come to fruition.

Growing Dependence on OPEC

Comparing the demand forecast provided in Table 2 with the non-OPEC supply projections In Table 4, we can calculate the residual demand for OPEC oil. This is the amount of oil OPEC must produce to close the gap between global demand and non-OPEC supply. The results are provided in Table 5. Most long-term projections of oil supply and demand simply assume that OPEC production is a residual that will be available to meet market demand.

Table 5 Growing Dependence on OPEC (Millions of Barrels Per Day)

	2000	2007	2015	2030
Global Demand	76.3	86.1	88.7	103.9
Less Non OPEC Supply (DOE)	46.2	50.4	51.3	60.0
Need for OPEC Oil (DOE)	30.1	35.7	37.4	43.9
Global Demand	76.3	86.1	88.7	103.9
Less Non OPEC Supply (IEA)	46.2	50.4	47.6	50.9
Need for OPEC Oil (IEA)	30.1	35.7	41.1	53.0

This Table examines the global demand for OPEC oil. The demand for OPEC oil is based on projections of oil consumption and production from the EIA and IEA.

The need for OPEC oil will grow from 35.7 mbd in 2007 to between 43.9 mbd to 53.0 mbd in 2030. This amounts to a significant increase in OPEC output (currently around 33-34 mbd) over a 20-year period under both the DOE and IEA forecast. Under the DOE forecast, OPEC production must still rise by 8.2

mbd by 2030. The IEA forecasts a 17.3 mbd increase in OPEC production over this period. Under both scenarios, most of the production increases will occur in the highly politically unstable Middle East. Essentially, the above analysis indicates that the OPEC countries must find the equivalent production capacity of one or two Saudi Arabia's over the next 20 years. Such a sizeable expansion in oil production capacity will prove to be a daunting challenge for the OPEC producers and will require a huge financial investment in both oil capacity and the infrastructure to transport it.

Implications of Dependence on OPEC

The growing projected reliance on OPEC production has the following implications:

1. Oil is a global market, therefore once non-OPEC production peaks and demand continues to grow; there will be strong upward pressure on oil prices.
2. Despite the two price shocks in 1973-75 and 1979-1980, oil prices, after adjusting for inflation, have been essentially flat for the last 40 years with no clear trend. This is about to change. Over the next few decades, oil prices are expected to trend upward, and do so at a rate well above the inflation rate.
3. The world currently has very little surplus oil capacity. According to the American Petroleum Institute, spare global capacity is at its lowest level in 30 years. Tight capacity is likely to be an ongoing characteristic of the oil market in the future, given the expected slowing in non-OPEC production.
4. With little spare capacity, oil prices will be highly volatile and will respond quickly to any sudden change in demand or supply.
5. There are major questions as to whether the OPEC countries or the countries in the former Soviet Union will be able to invest sufficient capital to meet the future needs of the global economy even if we assume that they have sufficient resources that can be extracted at a reasonable cost. This will create further uncertainty in the oil market.
6. Much of OPEC's production is in countries with high geopolitical risk. With a growing reliance on OPEC oil, a speculative risk premium will be a permanent feature in the oil market.
7. The threat is especially acute in Venezuela, where nationalistic policies could lead to a sharp drop in foreign investment and a drop in output. At risk are foreign oil companies plans to finance the commercial development of an estimated 235 billion barrels of extra-heavy oil found in the Orinoco Belt.

IMPACT OF PRICE ELASTICITY

The key unknown in the above projections is the eventual responsiveness of global demand and non-OPEC supply to higher prices. In economics jargon, we are referring to the concept of the elasticity of demand and supply for oil. Elasticity measures the responsiveness of the consumption and production of oil to changes in its price. In other words, the coefficient of elasticity measures the extent to which the growth of consumption will slow and that production will rise in response to higher prices. Estimates of the demand and supply price elasticity for oil vary widely but the consensus shows that the elasticity rises significantly with time as both businesses and consumers make adjustments in their spending habits and production decisions. Economic theory predicts that over longer periods of time, oil demand and supply should be highly responsive to price (a high level of elasticity). The historic data completely supports this prediction. In fact, the decades of the 1970s and 1980s provided a perfect test of this theory.

Consistent with economic theory, the high price of oil in the 1970s was followed by a surge in non-OPEC investment and production in the 1980s. At the same time, following the 1979-1980 price shock, the demand for oil stagnated for over 10 years. Surprising to many analysts, the global economy expanded at a healthy rate in the 1980s with essentially no growth in the demand for oil (energy-efficiency improved dramatically). What the data clearly shows is that in response to the higher price of oil, there was a sharp slowdown in the growth in demand for oil in the 1980s while the supply of oil rose. These results are just

as predicted by economic theory and indicate a high value for the long run elasticity of demand and supply.

Understanding the concept of elasticity has important implications for the future outlook of the oil market. The EIA and IEA forecasts provided in Tables 2 and 3 assume that oil prices rise at the inflation rate through the year 2030 (real price of oil is unchanged). If oil prices were to rise at a faster rate (not an unreasonable assumption), the projection of future global demand would be considerably lower, and at the same time, higher production is likely from non-OPEC sources. The global demand and non-OPEC supply imbalance would be considerably less, as would the need for OPEC production. The important point to understand is the higher the price of oil, the more important is the elasticity effect. This means that demand will expand at a slower rate and supply will expand at a faster rate in response to the higher price of oil. This, in turn, will limit the extent to which oil prices rise (because of lower demand and higher supply).

CONCLUSIONS AND IMPLICATIONS FOR OIL PRICES

Global oil production is likely to peak in the next few decades. The exact date that production will peak is difficult to determine but a careful analysis of the global oil reserve data suggests it could occur as early as 2014 or as late as 2040. The impact on global oil supplies will be dramatic even if peak production occurs at a latter date. There will be pressure on oil producers to find new sources of oil production just to offset the decline in capacity due to the maturing of the existing oil fields. This will be a daunting challenge as capacity is falling at an estimated rate of 3.5 mbd. Future global demand for oil will come entirely from the emerging countries, with no growth in oil demand expected in the advanced countries. Production increases will occur mainly in the OPEC countries and those of the former Soviet Union. Table 6 summarizes the amount of new oil production capacity (new oil discoveries) that must be added globally by 2030 to meet growing global demand and to offset production declines.

Table 6 Estimated Needs for New Oil Producing Capacity (Millions of Barrels Per Day)

Additional Oil Capacity need to:	2010-2030
Meet global demand	17.0
Replace loss of capacity due to aging of fields	70.0
Total	87.0

This Table estimates the need for additional global oil producing capacity (discoveries of new oil fields) by the year 2030.

The results show that oil production capacity must increase by a staggering 87 mbd by 2030 to meet demand growth and replace supply. In fact, as shown in the above Table, the loss of capacity will have a more important impact on future supply needs than the increase in demand. What makes the situation even more challenging is that peak oil analysis indicates that the rate of decline should accelerate with the increase in the age of the oil fields. If this prediction is correct, and peak production occurs in the next few years, there will be an even greater need to discover more oil in order to offset the larger declines in production. In addition, most of the new capacity coming on stream will be of oil of lower quality, more difficult to refine, with higher production costs and located in countries with high geopolitical risk. Given the need to replace a significant and growing amount of capacity and the growing demand from the emerging economies, oil prices should rise considerably over the next two decades.

INFLATION IN MARKET- AND BANK-BASED COUNTRIES: DO MONETARY CREDIBILITY, GLOBAL AND STRUCTURAL FACTORS MATTER?

Denis Wendt, University of Goettingen, Germany

ABSTRACT

Former studies mostly concentrated on the relationship between financial structure and growth. However, there are no studies which analyze the inflation development of bank- vs. market-based countries. If we look at the financial structure, which is computed by a conglomerate structure indicator, we find some specific characteristics of both financial systems. Against the background of these features, possible inflation determinants and conjoined differences are explained. In that sense one of the most important factor seems to be the monetary credibility - which might vary between market- and bank-based countries because of the before mentioned specific features of these financial systems. In a next step, the monetary credibility is approximated using long term governmental bond yields. Furthermore, global factors can also differ between both types of financial systems and influence the domestic inflation. This might especially be the case for the short- and long-term capital inflows as well as for the real openness. Last but not least, structural factors like credit variables are introduced into the analyses, too. To assess the empirical influence of these factors on inflation rates a Fixed Effect Panel Regression is used. The empirical analyses show a significant influence of monetary credibility on inflation in both groups. The other results are somewhat mixed, meaning for instance that some of the globalization variables are stronger in market-based countries whereas the structural effect is significant for bank based systems.

MONETARY POLICY TRADE-OFFS IN A PORTFOLIO MODEL WITH ENDOGENOUS ASSET SUPPLY

Stefan Schuder, University of Gottingen

ABSTRACT

This paper describes the development of a portfolio balance model for a small open economy with endogenous asset supply. Domestic producers finance capital goods through credit and bonds according to debt capital costs as well as equity assets. Private households hold a portfolio of domestic and foreign assets, shift balances depending on asset returns and swap equity assets with the producers in return for real goods depending on the relative price of domestic and foreign goods. In this environment, the central bank is able to stabilize the exchange but thereby, it provokes changes in the domestic price level and boosts domestic asset price volatility.

KEYWORDS: portfolio balance model, monetary policy, asset price volatility

SUMMARY

Portfolio balance models have a long history in economic research and are widely used to explain the characteristics of exchange rates. Prominent models were developed by Branson (1977), Lucas (1982), Allen and Kenen (1983) and Branson and Henderson (1985). In these models, private households chose an optimal portfolio containing domestic as well as foreign assets based on risk-return considerations.

In the context of monetary policy, the principal advantage of portfolio balance models is that they comprehensively illustrate in contrast to the former widely applied Mundell-Fleming framework why even in the case of a fixed exchange rate interest rate differentials may persist (Frankel et al., 2004; Shambaugh, 2004). However, Obstfeld (2004) remarks that further research is required since so far there is “no integrative general-equilibrium monetary model of international portfolio choice, although we need one”. Recent research analyzes the impact of different types of macroeconomic shocks on asset prices and the exchange rate (Hau and Rey, 2006; Gourinchas and Rey, 2007; Pavlova and Rigobon, 2007; Tille, 2008) and particularly tries to explain the home bias in asset holdings (Heathcote and Perri, 2009 and references cited therein).

The present contribution comprehensively considers the origination of financial assets with its implications for monetary policy transmission. So far, the supply of bonds and the amount of equity assets are rarely treated as endogenous in the portfolio balance literature. Neither the possibility to substitute bonds for loans nor the special characteristics of equity assets are considered. The present model fills the gap. Based on economic literature, it is argued that producers prefer the type of debt financing which requires the lowest capital costs (Bernanke and Blinder, 1988) and that equity assets contain call options on producers’ real capital goods (Merton, 1974). These relations are integrated into a portfolio balance model for a small open economy by strictly considering the balance sheet relations in stock and flow figures, a requirement stressed by Brainard and Tobin (1968).

Whereas in the short run the supply of assets and the demand for credit are constant and deviations from purchasing power parity are possible, in the long run purchasing power parity holds and the producers substitute credit with bonds depending on capital cost. Furthermore, the private households’ amount of foreign assets changes depending on current account imbalances and equity assets are swapped with the

producers in return for real goods depending on the relative price of domestic and foreign goods. The influence of changes in exogenous variables (foreign interest rate, country risk, foreign price level, credit amount, central bank's amount of bonds and foreign assets) on the endogenous variables (exchange rate, domestic interest rates, dividend payments, price level, amounts of assets and money) is determined by solving the obtained General Equilibrium Model in the short and in the long run.

It results that the central bank is able to stabilize the exchange rate in reaction to changes in exogenous variables by interventions on the market of domestic bonds and foreign assets as well as by adjusting credit supply. Even though the central bank is able to reduce side effects on remaining variables by neutralizing interventions, it is revealed that exchange rate stabilization is connected either with changes in the interest rate level or possible changes in the price level of domestic goods and equity assets. Consequently, exchange rate stabilizing interventions may not only affect the domestic price level but also increase the volatility of domestic bond and equity prices.

ECONOMIC GROWTH AND REDISTRIBUTION: AN UPDATE FROM THE DYNAMIC GAMES

James Robert E. Sampi Bravo, University Catholic Saint Toribio of Mogrovejo

ABSTRACT

Based on the differential game proposed by K. Lancaster, where both "working consumers" and "consumer's investors" try to maximize, knowing the evolution of capital stock, consumption over an infinite time horizon, we believe that both agents seek to maximize the present value of consumption, when both updated at different rates. This approach determines the optimum solution in a centralized economy as a non-cooperative game (solutions to Nash) and cooperative Pareto solutions forced by the social planner, and compare the model solution in a decentralized economy, where rates economic growth are converging to a steady state and obtain high rates of inflation, however higher levels of consumption. Alternatively, the cooperative solution found between agents (Shapley value) and can be confirmed, that in a capitalist game continues to monitor the cooperative principle, in which the maximum benefit is obtained in the cooperation.

KEYWORDS: Differential game, non-cooperative game and cooperative game.

INTRODUCTION

Since the publication of the book of von Neumann and Morgenstern (1994) *The Theory of Games and Behavior*, many authors have relied on game theory to represent a vast range of dynamic conflict situations in the field of economic theory, however, We consider the work of Kelvin Lancaster (1973) as the first reference of the application of differential games to economic growth and redistribution in our modern economy. Lancaster made a differential game between two agents called workers and capitalists, based on the topics of the accumulation and redistribution of benefits among social classes, studied the classics as Malthus, Ricardo and Marx, concluding that cooperative outcomes outperform non-cooperative.

In this research, we find the solutions of differential game, with changes to the original approach of Lancaster, comparing the solutions found to the Nash and Paretian solution, under a centralized economy and solutions in a decentralized economy in an infinite time horizon, where the two agents present value discounted to their consumption at different rates, then we will study the dynamic behavior of the economic growth model proposed by modifying the golden rule posed by Ramsey (1928) so as to maximize the consumption of these agents over time constant and determining the value of redistribution that should be awarded in the economy for both agents

LITERATURE REVIEW

Then the work of Lancaster, Hoel (1978) studied the effect of considering the utility function of players discounted consumption over time. On the other hand Pohjola (1983) compared the Nash solution found by Lancaster with the Stackelberg solution in open cycle. This article would be years later commented on by de Zeeuw (1992) showing that the solution found by Pohjola is not complete and that there are infinitely Stackelberg balances. Similarly, Soto and Ramos (1992), made the same comparison of results in a Stackelberg game solution, and a cooperative Pareto solution, modifying the model, where both players seek to maximize the present value of consumption, when the two updated at the same well,

reaching the result that the cooperative solution is Pareto more efficient than the one found in Stackelberg solution.

MODEL

It is considered a closed economy, the production $Y(t)$; in an instant of time t can be either consumed or intended for investment capital stock $K(t)$. In this sector economy are two social agents called "working consumers" and "consumer investors," we assume that the production function takes the form proposed by Rebelo (1991): $Y(t) = f(K) = A \cdot K(t)$, where A is the technology parameter. Additionally, some assumptions are adopted the model proposed by Ramsey (1928), as the infinite life that pose individuals, this due to the existence of dynasties. Also, we note that the population grows at a rate " n " and there is no physical depreciation of capital or $Y(t)$ is the net rather than gross production.

At each instant of time "working consumers" can be controlled with a variable proportion of total output that is targeted towards consumption. Following González (1998) assume that this variable is defined in an interval $[a, b] \subseteq [0, 1]$. The consumption of workers will be denoted by $C_1(t)$ and is given by: $C_1(t) = \alpha(t) \cdot \theta \cdot f[K(t)]$, where " θ " is the marginal propensity to consume.

For their part, "consumers investors" have at their disposal all the output not consumed by the "working consumers," it intended either for their own consumption or to reinvest in the economic system. With the variable $\beta(t) \in [c, d] \subseteq [0, 1]$ control the proportion devoted to investment. The rest $C_2(t)$, their consumption is $C_2(t) = [1 - \alpha(t)] \cdot [1 - \beta(t)] \cdot \theta \cdot f[K(t)]$.

Investment in this economy is given by the variation in the accumulation of capital stock. This leads to the following differential equation:

$$\dot{K}(t) = I(t) = [1 - \alpha(t)] \cdot \beta(t) \cdot \theta \cdot f[K(t)] \quad (1)$$

Players seek to maximize their utility over an infinite time horizon, unlike the model proposed by Lancaster (1973), Pohjola (1983), Hoel (1978), Soto and Fernandez (1992) and Gonzalez (1998) who work with infinite horizon. Following Hoel, the utility we identify with the consumer using a positive discount factor denoted as λ for "working consumers" and ψ to "consumers investors". Thus we have the payoff function of each of the players:

$$J_1 = \int_0^{+\infty} \alpha(t) \cdot \theta \cdot f[K(t)] \cdot e^{-\lambda t} \cdot dt \quad (2) \quad \text{and} \quad J_2 = \int_0^{+\infty} [1 - \alpha(t)] \cdot [1 - \beta(t)] \cdot \theta \cdot f[K(t)] \cdot e^{-\psi t} \cdot dt \quad (3)$$

Only remains to establish a state of the capital stock at the initial instant: $K(0) = K_0$ (4)

The game consists in finding for each player as a watchdog over time varying in $[a, b]$ and $[c, d]$ respectively for each player, so as to maximize (2) and (3) subject to system dynamics described by (1) as an initial condition given by (4).

IMPLICATIONS OF A CENTRALIZED ECONOMY

In this economy there is a benevolent social planner that seeks to maximize the welfare of society as measured by the level that they consume. Under this approach, the economy can be managed under two solutions, such as non-cooperative called *the Nash* and cooperative solutions forced by the social planner. When the economy has a non-cooperative solution, the solution of the model leads us to capitalization rates "consumer's investors' relatively low and high consumption levels. On the other hand, when the social planner seeks a cooperative solution, it can choose four possible solutions, among which we mention two of its high power of political decision, "maximal" and "maximum accumulation", in these two periods is social planner can manipulate the economy, according to the situation that wish to reach.

Finally, in the centralized economy, economic growth is constant over time and depend on the level of technology that have the economies, to identify positive changes in these levels of growth. And the value of redistribution achieved in a centralized economy is relatively low.

IMPLICATIONS IN A DECENTRALIZED ECONOMY

When we solve the model, under a decentralized economy, it eliminates the idea of a social planner and is the "economic agents", are called upon to find the optimal path of capital stock per capita and consumption per capita. Based on the considerations made by Sidrauski (1967), the economic agents consider variables such as inflation and nominal balances, in addition the Central Bank prints fiat money (with zero cost) and real assets in return get back to families in the form of a transfer S . In this decentralized economy, we find that the intertemporal discount factor for both agents coincided with the value of inflation; this means that inflation was a function that depended on consumption. The market capitalization of the agent "consumer investor" was the highest level of assessment, while the agent "consumer worker" is at its lowest level dimension.

Moreover, the convergence of the economy was given by a steady state, unlike the management of a centralized economy, in this economy the capital stock and consumption per capita, reaching stationary. And so, economic growth reached a steady state, and it was not constant over time, despite being an endogenous model.

AN ALTERNATIVE SOLUTION: THE SHAPLEY SOLUTION

Was studied the possibility of solving the model under a cooperative solution, called the Shapley value. From this perspective, redistribution of consumption between agents was the maximum value of consumption that these could get. From a micro view, this solution will be desirable, but under a macro overview, economic growth under this cooperative solution among agents, is negative.

CONCLUSION

The innovations of the Lancaster model, the existence of different discount rates for each of the players and the introduction of an institutional framework that annotates the player controls, significantly enrich the analysis of differential game of economic growth arriving at the conclusions:

We can say that the equilibrium of the game found from the perspective of a centralized economy, are established in the value of redistribution between agents, by the parameters $(A, \lambda, \psi, \theta)$ and the values set in the political process dimension to the discretion of the players control (a, b, c, d) and Nash obtained is optimal bang-bang type, optimum control for the capitalists of c , which is interpreted as the minimum permissible capitalization which must govern the social planner to maximize consumption in the economy.

With respect to the dynamics of the model, we obtained positive growth rates and constant over time and phase paths of the model show a globally unstable system, but shows a steady growth in consumption with increasing the capital stock.

It is the solution based on decentralized, in which each player's optimal controls are reversed to those found in the centralized economy, where the player gets a capitalist optimum control variable value at its maximum dimension (higher levels of capitalization), while Player worker obtains optimal control variable at its minimum value of dimension (extremely low consumption values.) And unlike the centralized economy, steady states are obtained in the economy, and rates of discount factor equal to the rate of inflation. From this perspective, the economy will have high interest rates and the dynamics of the model, leads to continued increases in the level of wages ended with higher inflation rates. And it is

evident that the value of redistribution of consumption in the decentralized economy is greater than from a centralized economy

Alternatively, have conducted an analysis of a cooperative solution between agents (Shapley value), where these covenants and agreements of the game both reach maximum levels of consumption, under this solution proved that the rate of economic growth will be negative. And the value of redistribution among agents is greater than what is available in a centralized and decentralized economy.

TOWARD A COMPREHENSIVE SUSTAINABILITY INDEX

Parimal Bhagat , Indiana University of Pennsylvania,
Madan M. Batra, Indiana University of Pennsylvania,
Amandine Miodek, Management Consultant,

ABSTRACT

Sustainable practices of multinational corporations and other entities are as diverse as the organizations themselves and lack a cohesive, holistic approach to addressing issues of sustainability. One reason for such pluralism is the limits of academic research in this domain in capturing a comprehensive view of sustainability. Dimensions to assess sustainability considered by many scholars – but not without dispute - include environmental, social, cultural and economic factors. The purpose of this paper is to examine the existing measures of sustainability with a goal to integrate and synthesize the myriad of factors into a relatively parsimonious but holistic measure that incorporates the different scholarly perspectives. The various factors and measures that are considered include the following: Domini 400 Social Index; Dow Jones Sustainability Index; Environmental Sustainability Index; Happy Planet Index; Gross National Happiness; Human Development Index; Living Planet Index; Humanities' Ecological Footprint; Genuine Progress Index; and, Calvert-Henderson Quality of Life Indicators. Finally, the proposed comprehensive sustainability index would be discussed in the context of the key players including multinational corporations, governments, and not-for-profit organizations.

AN INNOVATIVE STATISTICAL APPROACH TO IDENTIFY AND MEASURE CANNIBALIZATION IN MULTI-BRAND STRATEGIES

Vikas Singh, Indian Institute of Management Calcutta (IIM-C)

ABSTRACT

Identifying and measuring cannibalization in multi-brand multi product portfolio is still quantitatively inadequate. This paper presents a statistical method to identify and measure cannibalization through various attributes. This paper aims to present a methodology using regression models with brand sales, cost factors and market growth as attributes to measure depth of cannibalization. The suggested model gives validation with known results of bundle sales and then testifies multi-brands of a healthcare sector company. The model captures cannibalization effect with approximate measure in terms of attribute's coefficients. The model is also successfully tested against cannibalization for two brands (B_1 and B_2) operating in two different markets (M_1 and M_2).

INTRODUCTION

Companies always interested in super normal profit and customers' diversification behavior supports them to go for multi-brands capturing large share. However, the major tradeoff is cannibalization, responsible for making it a critical management task while estimating the effect of new launch on existing portfolio (Kerin et al., 1978; Nadler, 1997; Chen and Yu, 2001). Even leveraging the brand equity is a struggling effort in same context (Tauber 1981; Ries and Trout 1986; Aaker 1991). The cannibalization effect due to multi-brands and its effect in portfolio have still not studied in depth (Carpenter and Hanssens, 1994).

The concept of cannibalization coined long time ago when Heskett (1976) defined cannibalization "the process by which a new product gains sales by diverting them from an existing product." According to Copulsky (1976) definition "the extent to which one product's customers are at the expense of other products offered by the same firm." There is no single accepted definition of cannibalization and in the same way, it is difficult to determine or quantify. Cannibalization has identified as a real threat as stated by Lomax et al. (1997) "Cannibalization is a very real threat for the vast majority of new product launches. But there has been little empirical work which quantifies this threat." Buday (1989) discussed the marketing perspective of product cannibalization and Carpenter and Hanssens (1994) stressed on the difficulty in cannibalization measurement. Hui (2003) discussed the insufficiency of quantitative methods regarding cannibalization measurement.

Literature suggests that cannibalization measurement required various attributes (Wanke et al., 1998; Kim and Chhajed, 2000, 2001; Krishnan and Gupta, 2001). In this paper, the revenue patterns of different brands estimates cannibalization through different attributes including marketing cost, direct distribution cost, market growth.

According to Rao (Rao, 1973), use of coefficient of determination is well established in classical regression analysis and its definition as the proportion of variance 'explained' by the regression model makes it useful as a measure of success of predicting the dependent variable from the independent variables (Nagelkerke, 1991).

The suggested model uses Durbin-Watson statistic to test autocorrelation free residuals. The high number of attributes leads to the non-linear relationship model however, White (White, Kenneth J. 1994) argued,

“exact distribution of the Durbin-Watson statistic can be easily approximated for nonlinear models and the test statistic has good power and may be superior to alternative asymptotic tests.” Regression model uses independent variable, also called explanatory variable, are the attributes and revenue is the dependent variable. Higher value of coefficient of determination represents efficiency of the model to capture the variability in revenue with the given attributes.

CANNIBALIZATION MEASUREMENT METHODOLOGY

There are various attributes contributing to any pattern like revenue etc. The entire information of such attributes mostly not available hence limited attributes has been setup for the model and tested one by one to check their contribution in the pattern. The weights associated to attributes represent their contribution of variability in the pattern therefore, in order to measure the cannibalization, our interest is to identify correct attributes, which explains, and capture maximum variability.

Models (Validation & Testing)

These cannibalization measurement models include two pacemaker brands of a company in healthcare industry. Before moving to cannibalization test, bundle sales, one of the best-known relationships, used to validate the model.

$$Rev_{lead} = f(Rev_p, Marketing\ cost, DD\ cost) \quad (1)$$

Various combinations of attributes are possible such as

$$Rev_{lead} = \alpha (Rev_p) + \beta (Marketing\ cost) + \gamma (DD\ cost) + \delta (Marketing\ cost^2) + \varepsilon (DD\ cost^2) + \dots \dots \quad (2)$$

Here $\alpha, \beta, \gamma, \delta, \varepsilon$ are the coefficients calculated from the modeling for every polynomial relationship of different attributes.

We know that product sales have different supporting factors. Similarly, pacemaker product sales have factors such as financial investment in marketing and distribution, sales channel efficiency, customer purchase behavior, market growth, competitor's performance etc. Equations (1) and (2) describe the relationship of these attributes with the test entity in the form of mathematical functions.

In Pacemaker industry, both pacemakers and leads sales generates revenue. A particular pacemaker has leads as accessories just as cable wires to any electric equipment hence leads sales are unavoidable with pacemakers. In addition, the attributes associated to sales of leads are limited due to high dependency on pacemaker sales, which are revenue of pacemaker, marketing cost and direct distribution (DD) cost. Therefore, if we have to test the relationship of revenue growth pattern of Leads with Pacemaker then it is clear that both are highly correlated due to bundling.

Following model represents the percentage change in test entity (leads sales) with 1% change in multiple attributes.

$$\log (Rev_{lead}) = \alpha \log (Rev_p) + \beta \log (Marketing\ cost) + \gamma \log (DD\ cost) + \delta \log (Marketing\ cost^2) + \varepsilon \log (DD\ cost^2) + \dots \dots \quad (3)$$

The differentiation of the equation (3) gives the direct relationship of percentage change in any attribute to test entity.

Pacemaker And Lead Data Validation

As discussed in previous section, the model includes revenues from pacemaker and leads. Figure 1 suggests the revenue trend of pacemakers and leads. There is a high correlation between pacemaker and lead revenues as explained due to bundle sales.

Figure 1: Quarterly Revenues of Pacemakers and Leads (2007-10)

This figure shows the quarterly revenues of pacemakers and leads from 2007 through 2010. Revenue figures shown vertically having leads revenue on secondary axis.

15	2836.677	-80.6766	-0.44474	-3.06644	0.197796	9.403074
16	3537.427	120.5727	0.664676	1.109419	0.441794	1.230811
					15	30.30448
					DW	2.020299

This table shows the calculations to determine coefficient of determination, Durbin Watson statistic and coefficients of different attributes to find out their contribution in variability of leads revenue.

The coefficient associated to pacemaker revenue (1.069117) is close to unity therefore the model suggests that percentage change in pacemaker revenue is proportional with unity slope to percentage change in leads revenue. Similarly, coefficients of other attributes explain the relation with leads revenue. Coefficient of determination (98.46%) indicates that polynomial combination of explanatory variables (Pacemaker revenue, marketing cost, distribution cost) well capture the variability in dependent variable (Lead revenue).

$$DW = \frac{\sum (e(t) - e(t-1))^2}{\sum e(t)^2} \quad (4)$$

Equation (4) describes the calculation of Durbin-Watson used in Table 1. Durbin-Watson statistic (2.02) is close to 2.0 and under acceptable range (between 0 and 4); therefore, the model is free from autocorrelation. Hence, the known revenue relationship of leads with the pacemaker successfully tested with this model.

CANNIBALIZATION RESULTS

Further, two pacemaker brands (B_1 and B_2) of same company applied to same model to estimate the cannibalization effect. Products of both the brands operate in two markets, single chamber (M_1) and dual chamber (M_2). Both markets have different characteristics in terms of maturity and customer purchase behavior. M_1 is mature and saturated with higher number of competitors. On the contrary, M_2 is a new market with little number of competitors. In addition, the product differentiation is highly visible in M_2 that is not the case in M_1 . The market characteristic suggests high possibility of cannibalization in market M_1 between both the brands and little or zero cannibalization in market M_2 .

Market M_1

$$Rev_{B_1} = f(Rev_{B_2}, \text{Marketing cost}, DD \text{ cost}, \text{Market Growth}) \quad (5)$$

Equation (5) shows revenue of one brand in terms of revenue of second brand, marketing cost and direct distribution cost and market growth. This is similar to what has presented for pacemaker and lead revenue validation in last section. Following model is well able to capture the cannibalization effect between the pacemaker brands B_1 and B_2 . Various combinations used to derive the best combination having highest coefficient of determination in the acceptable range (0-4) of Durbin Watson statistic.

$$\begin{aligned} \log(Rev_{B_1}) = & \alpha \log(Rev_{B_2}) + \beta \log(\text{Marketing cost}) + \gamma \log(DD \text{ cost}) + \delta \log(\text{Marketing cost}^2) + \\ & \varepsilon \log(DD \text{ cost}^2) + \Omega \log(\text{Market Growth}) + \dots \dots \end{aligned} \quad (6)$$

Figure 2 gives the relationship between individual brand sales in market M_1 . The brand B_2 coefficient of model in equation 6 (negative slope) is a clear evidence of cannibalization in terms of varying brand potential. Identification of attributes is a challenge therefore; different combination of attributes required checking for their individual contribution in variability. The table below is a summary of explanatory variables used for the model.

Figure 2: Relationship Trend Line between Brands B_1 and B_2 in Market M_1 

Trend line between brands B_1 and B_2 gives negative coefficient that is a clear evidence of cannibalization.

Table 2: Table of Coefficients for Different Set of Attributes in Market M_1

Market M_1		Revenue B_1	
DW	R ²	Attributes	Rev B_2 Coefficient
1.3	41.84%	Rev B_2	-0.21
2.4	43.85%	Rev B_2 , Marketing Cost, DD Cost	-0.15
2.28	59.53%	Rev B_2 , Marketing Cost, DD Cost, (DD Cost) ²	-0.11
2.22	68.27%	Rev B_2 , Marketing Cost, DD Cost, (Marketing Cost) ² , (DD Cost) ²	-0.10
2.14	84.57%	Rev B_2 , Marketing Cost, DD Cost, (Marketing Cost) ² , (DD Cost) ² , Marketing Growth	-0.08

This table shows the value of coefficient of determination, Durbin-Watson statistic and brand B_2 coefficients for different set of attributes in market M_1 . DD signifies direct distribution cost.

The negative relationship implies cannibalization between brands B_1 and B_2 in market M_1 and the coefficient value helps to estimate the extent of cannibalization. The explanatory variables including brand B_2 Revenue, marketing cost, direct distribution cost and Market growth, able to capture 84.57% of the variability in revenue of brand B_1 under acceptable range (0-4) of Durbin Watson statistic i.e. 2.14. Overall, the model is able to identify the effect of cannibalization (negative slope) and extent of cannibalization threat with coefficient value. The cannibalization model in equation (6) gives directly the percentage change in revenues of test entity (brand B_1) in proportion to coefficient value to quantify the cannibalization threat.

Market M_2

Same modeling used for dual chamber but there is no cannibalization observed in this market. As stated earlier, the reason is quite straight as highly visible product differentiation.

Figure 3: Relationship Trend Line between Brands B_1 and B_2 in Market M_2 

Trend line between brands B_1 and B_2 gives positive coefficient, which is an evidence for absence of cannibalization.

The graph shows the absence of cannibalization in market M_2 with modeling coefficient close to unity. The coefficient of determination suggests 89.23% capture of variability in sales of brand B_1 with Durbin Watson statistic close to 2.0.

Table 3: Table of Coefficients for Different Set of Attributes in Market M_2

Market M_2		Revenue B_1	
DW	R^2	Attributes	Rev B_2 Coefficient
1.28	59.96%	Rev B_2	1.11
1.39	64.30%	Rev B_2 , Marketing Cost	1.08
2.20	81.83%	Rev B_2 , Marketing Cost, DD cost, (DD Cost) ²	1.03
2.03	83.27%	Rev B_2 , Marketing Cost, DD cost, (Marketing Cost) ² , (DD Cost) ²	1.01
1.98	89.23%	Rev B_2 , Marketing Cost, DD Cost, (Marketing Cost) ² , (DD Cost) ² , Marketing Growth	1.01

This table shows the value of coefficient of determination, Durbin-Watson statistic and brand B_2 coefficients for different set of attributes in market M_2 . DD signifies direct distribution cost.

It is almost impossible to get coefficient of determination 100% because it is not possible to capture entire range of variability with exact mathematical model of limited number of explanatory variables. However, identification of more explanatory attributes and their functional relationship can improve the coefficient of determination.

CONCLUSION AND FUTURE WORK

Cannibalization is always being a tradeoff to multi-brand strategy therefore cannibalization measurement will be useful to understand the need of various other strategies such as differentiation, market entry, market exit etc. The regression-based model used to measure the extent of cannibalization. The work presented here between two brands however, it can extend under multi brand condition to quantify the damage done by any brand to other brand under same portfolio. These measures will help to formulate the strategies, which incorporate focused objective of cannibalization reduction parallel to obvious ones of increasing individual brand sales.

Overall, the paper suggests a statistical approach to deal with a very real threat in multi-brand regime. Even though checking with all the possible attributes combinations with various functions is highly computationally intensive but various other attributes such as customer purchase behavior and leading indicators can facilitate improvement in the variability capture.

AN APPLICATION OF PANEL DATA TO MANUFACTURING SUBSECTORS IN MEXICO

Lourdes Alicia González Torres, Universidad Autónoma del Estado De Baja California
Juan Manuel Ocegueda Hernández, Universidad Autónoma del Estado De Baja California
Manuel Alejandro Ibarra Cisneros, Universidad Autónoma del Estado De Baja California

ABSTRACT

This article is an application of a panel data , one of the most popular forms of longitudinal data analysis. We intend to achieve the following goals: first, to estimate a regression model using pool data for the manufacturing subsectors in the 32 states of Mexico; second, to explain regional divergences by determining the relation between the coefficients' estimates and the economic growth rates; third, to estimate the Verdoorn's coefficients for the 32 states of Mexico during the same period, using the Ordinary Least Square method (OLS); finally, to identify the key subsectors to be considered when formulating regional policies for the reduction of the observed differences, as well as for the development of the whole country.

MODELS, METHODS AND DATA

In this article we make use of the following of models:

The random effects model. We make use of it in most of the estimations of the returns of scale in the nine manufacturing subsector. The assumption is that the intercept is a random outcome variable (Greene, 2003);

The fixed effects model. It is used in order to estimate the 32 subsector. The slopes are constant and intercepts vary for states according to the Hausman test ;

The theoretical model related to the Verdoorn's law. It is referred to in the estimation of the pool data. According to this model, there is a positive relation between output-productivity. The Verdoorn's law has been used in order to explain the persistence of divergences in economic growth rates .

We perform a regression using Ordinary Least Squares with panel data for the nine manufacturing subsectors in Mexico. This approach has a major advantage: it allows the simultaneous analysis of individual and aggregate dynamics, by taking into account space and time. The spatial dimension is represented by the states of Mexico, whereas the temporal dimension is given by the sequence of observations in 1985, 1990, 1994, 1999 and 2003 respectively. Concerning the data used in the construction of variables, we make reference to Gross Added Value, Net Fixed Actives, Rate of Employment, Gross National Product, Gross State Product and Prices Index.

RESULTS

The results of this paper are twofold. On one hand very interesting findings about increasing returns in manufacturing industry emerged both for regions and for subsectors; on the other one, we have found a direct relation between small Verdoorn's coefficients (increasing return to scale) and high development rates.

PREDICTING INNOVATION ACTIVITY IN EUROPEAN MANUFACTURING FIRMS: A MULTI-COUNTRY EMPIRICAL STUDY

Avraam Papastathopoulos, Technological Educational Institute of Ionian Islands

Christina C. Beneki, Technological Educational Institute of Ionian Islands

ABSTRACT

The purpose of this paper is to investigate the factors that influence the Internal Process Innovation (IPI) Activity of the European manufacturing firms. Moreover, a predictive model is developed that can be used to predict which manufacturing firms are more likely to introduce any new or significantly improve their internal processes. This survey is part of the “e-Business Watch”, a service launched in 2007 and provided by “empirica GmbH” to the European Commission, Enterprise and Industry Directorate General, in co-operation with renowned international partners. In the present study, 914 European manufacturing small, medium and large enterprises were examined and a set of hypotheses, regarding their innovation activity, were developed. To test the hypotheses and determine the likelihood of increasing the innovation activity of firms, we used a binary logistic regression model that was estimated by the maximum likelihood method, with a dichotomous dependent variable (introduction any new or improvement of internal processes and non-introduction/improvement). The results showed that the adoption of Enterprise Resource Planning (ERP), Customer Relationship Management (CRM) and the electronic information exchange between business partners are positively related to firm’s process innovation activity. Moreover, the results revealed that the employment of ICT-qualified employees, investments in ICTs, firm size and long-term relationships with suppliers also played a major role for European manufacturing firms to conduct internal innovations. Descriptive results regarding the above variables are analyzed and discussed in the paper. The paper highlights the fact that the innovation activity of the firms is deeply affected by a number of different factors, both internally and externally. The model can be used to provide managers with useful guidelines for implementing appropriate practices to develop their innovation activities and to respond to enhanced competitiveness.

KEYWORDS: Innovation activity, Processes improvement, ICT, Manufacturing firms

INTRODUCTION

Innovation is crucial for ensuring competitiveness of companies and industries (Galia and Legros, 2004; Tourigny and Le, 2004; Storey, 2000). In our days, firm’s survival is often dependent on the degree to which they incorporate innovation into their business strategy, especially because of increasing global competition (Cefis and Marsili, 2006). It is widely accepted that firms, which successfully satisfy market demands and customer preferences can develop and maintain a long-term competitive advantage (Panayides, 2006). The ability to introduce innovation often depends on the adoption and use of advanced technologies, such as Information and Communication Technologies (ICT). The last twenty years the value and the importance of ICT has become increasingly decisive and ubiquitous in all organizational processes. Technology exerts an important impact on social and financial innovation and development (of societies and economies) since a long time ago. The Global Information Technology Report 2006–2007 makes its appearance at a critical juncture as far as the impact of ICT on the world economy is concerned. There is growing evidence that ICT is driving innovation by allowing creative thinking and responsive problem-solving to provide the promise of unprecedented opportunities for all (Dutta and Mia, 2007). The rapid deployment of the internet, the corporate databases and information-enterprise systems accelerated

this process of modifications to enterprises' internal and external environment. This new 'technology-driven' situation and its possible evolution provide abundant new challenges in all functional areas across the enterprise (Carneiro, 2006).

ICT has far-reaching properties. It is a so-called general purpose technology, or "*key enabling technology*", with three basic characteristics: it is pervasive as it spreads to most sectors of the economy; it improves over time and hence keeps lowering costs for users; and it spawns innovation, as it facilitates research, development and market introduction of new products, services or processes. This last property can be termed the "enabling role of ICT for innovation" (European Communities, 2010). From the early work of Barney (1991) through to studies by Lee (2000), Koellinger (2005, 2006), McAfee (2006) and to the more recent research by European Commission (2006, 2008), the successful innovation may be dependent on the presence of other organization specific skills and capabilities, like the implementation of ICT (Barney, 1991). ICT made a direct impact on process innovation in an organizational setting by facilitating inter-organizational integration and collaboration enhances the innovation capabilities of companies by providing opportunities for shared learning, transfer of technical knowledge and resource exchange (Koellinger 2005, 2006; Lee 2000). The most obvious benefit of information integration with the help of ICT is the optimization of the value chain in order to eliminate the so-called "bullwhip effect", that is to say how small variations in intermediate and final demand levels along a supply chain can add up to significant disturbances and disruptions (European Commission, 2008). Other, less obvious consequences for firms' innovativeness include the creation of communication infrastructures, which facilitate the production networks or enable partners to align the incentives of multiple players by creating joint business units or teams managing the same tasks (McAfee, 2006). Ultimately, ICT investments can enable process innovations if the implementation of new ICT succeeds, the routines are changed and the new system is actually utilized (European Commission, 2006).

While there is an extensive body of literature on innovation activities of the firms, there is scant research on the relationship between internal process innovations and ICT-related factors. In addition, the existing studies are fragmented and provide incomplete explanations for the ICTs that enable the introduction of new innovations which may significantly improve the firm's internal processes. The majority of innovation studies have been primarily focused on the stimulating effect of innovation to a firm's growth (Coad and Rao, 2008, Wolff and Pett, 2006; Motwani et al., 1999), the impact of innovation on a firm's performance (Dibrell et al., 2008, Verhees and Meulenbergh, 2004), the effect of innovation on the survival of firms as a whole (Cefis and Marsili, 2006; Buddelmeyer et al., 2006) and the development of competitive advantages (Lewis et al., 2002).

This paper reports the results of a study that examined factors to Internal Process Innovation Activity among a sample of 914 manufacturing small, medium and large enterprises in seven selected EU countries (UK, France, Germany, Sweden, Spain, Italy and Poland). Specifically, the seven factors (independent variables) which take place in our study, concern *adoption of ERP and CRM systems*, employment of ICT practitioners, investments in ICTs, electronic information exchange between business partners, type of relationships with suppliers and, one further variable are included on the basis of research plausibility, firm size. The first objective of the study is to analyze the descriptive statistics of the above variables for each EU country and the second is to develop a predictive model that can be used to predict which firms are more likely to introduce any new or significantly improve their internal processes. The results will help develop a deeper understanding of the factors to and predictors of internal process improvements and will provide practitioners with useful guidelines for implementing appropriate practices to extend their innovation activities and to respond to enhanced competitiveness.

This study provides distinguishing contributions to the extant literature in the following ways. First, previous studies have investigated innovation activity in a specific country (Wolff and Pett, 2006; Madrid-Guijarro et al., 2009; Carol Yeh-Yun Lin and Mavis Yi-Ching Chen, 2007). This study examines

the innovation activity in seven EU countries. A second distinguishing contribution of the current study from prior studies (Dibrell et al., 2008; Ru-Jen Lin et al., 2010) is that it broadens the number of ICT-related factors influencing firms' process innovation activities. Lastly, the major contribution of this study lies in that it brings scholars and practitioners closer to new factors influencing the process innovation activity of firms.

The paper is organized as follows. First, we underpin our formal hypotheses with a discussion stemming from the relevant theory and prior research conclusions. Secondly, we present a discussion of the methodological issues regarding survey development, sampling and data collection. Thirdly, the results of our research are followed not only by an analysis, but also by relevant interpretations. The last section contains a discussion on these findings as well as our conclusions, while a discussion on the limitations of our research and its implications for further future research is also included.

THEORY REVIEW AND HYPOTHESIS DEVELOPMENT

Innovation & Process Innovation

Innovation has been perceived as the cornerstone for achievement in the business sector of the 21st century, large and small organizations have begun to re-evaluate their products, their services and their operations in an attempt to develop a culture of innovation. This re-examination of organizational purpose is due to a recognition that developing a culture of innovation within the organization is the best insurance that an organization can have of longevity in the new environment of fast-moving and competitive market (European Commission, 2004). The conception of innovation has evolved significantly over the last forty years. During the 1950s, innovation was considered as a discrete development resulting from studies carried out by isolated researchers. Nowadays, innovation as defined by the European Commission is «the renewal and enlargement of the range of products and services and the associated markets; the establishment of new methods of production, supply and distribution; the introduction of changes in management, work organization, and the working conditions and skills of the workforce» (Commission of the European Communities, 1995). According to Dibrell et al., (2008), innovations vary in complexity and can range from minor changes to existing products, processes, or services to breakthrough products, and processes or services that introduce first-time features or exceptional performance. Process innovation, in this research, refers to the changes made in the processes or technologies used by the organization to deliver products or services (Walker, 2005).

Innovation Activity & ICT

Innovative activity by firms is thought to be an important way to gain competitive advantage and outperform other firms. Firms that introduce new products or process will have an advantage in the market, as each innovation can provide a growth opportunity for an existing firm or a new firm (Frenken and Boschma, 2007). Basic and applied technological knowledge can yield high payoffs and act as a source of competitive advantage for private firms (Spencer, 2001). Based on the literature, the initiatives of innovation and ICT are complementary (Dibrell et al., 2008). ICTs transform the process of replicating business innovations across organizations (Brynjolfsson et al., 2006). Traditionally, deploying business innovation on a larger scale proved to be time-consuming and required considerable involvement of resources and employees. In our times, ICTs allow companies to embed business innovations and then implement them across the organization at a much smaller cost than before without compromising on quality. Every location or unit implements and follows all steps of the new process in a way specified in the software design (European Commission, 2008).

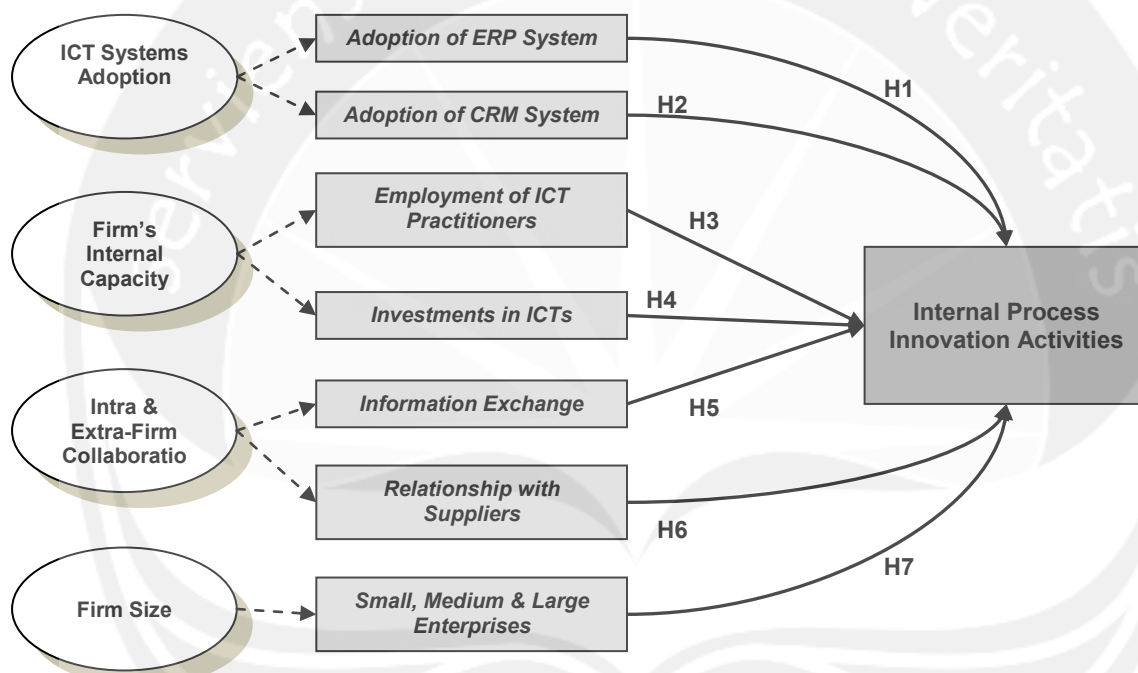

In the following section, we explain our conceptualization of the relationship between process-related innovations/improvements (independent variable) and related factors (dependent variables) that are under

investigation in this research. All the dependent variables may be perceived as too great of a challenge to overcome in order to expand firms' process innovation activities. The dependent variables are grouped into the following four categories:

- i. ICT Systems Adoption
- ii. Firm's Internal Capacity
- iii. Inter and Extra-Firm Collaboration-Relationships
- iv. Firm Size

From the above independent and dependent variables, we develop our model in forward order, left to right in Figure 1, proposing testable hypotheses for predicting process innovation activities in EU manufacturing firms.

Figure 1: Distribution of interviews by firm size and sector

This figure provides a graphic illustration of all hypothesized associative influences.

Erp & Internal Process Innovation Activity

ERP system is a packaged business software system that allows a company to automate & integrate the majority of its business processes, and share common data and practices within and beyond a firm's boundary (Hitt et al., 2002). Following a literature review, we were able to identify a multitude of ERP benefits to businesses such as inventory reduction, data integration and cost reduction (Holsapple and Sena, 2005, Gefen and Ragowsky, 2005, Buonanno et al., 2005), and inventory reduction (Sumner, 2000).

Last years the researches emphasize on the ERP technology as an enabler of business process reengineering (BPR); it deals with issues of process orientation and the organizational change – both internally and as a second phase in the supply chain (Papastathopoulos and Beneki, 2010; Davenport et al., 2004; Davenport and Brooks, 2004; Willis and Willis-Brown, 2002; Al-Mashari, 2001). Within this context, a study conducted by Buonanno et al., (2005) argues that the large companies making use of an ERP system expect a wider extent of business transformation (business process reengineering and

business network redesign), while SMEs always schedule a limited organizational change in the case of ERP adoption; thus, they seem not to consider ERP systems as a keystone for organizational innovation. These findings were generally supported by the study of Raymond and Uwizeyemungu (2007), although the latter study also identified that only the SMEs with a greater production and innovation capacity are more likely to adopt ERP systems.

Taking into account the arguments stated above, we formulate the first hypothesis:

H1: Manufacturing firms implementing an ERP system are more likely to introduce any new or significantly improve their internal processes, in comparison with their peer-group.

CRM & Internal Process Innovation Activity

CRM is a tool designed to integrate and automate management of all client-facing tasks in order to help build and retain their loyalty. CRM refers to the utilization of extensive strategies and engineering to find, obtain, and cultivate advantaged customers, and hence maintain long-term partnerships (Sin et al., 2005). It is based on the recognition that not all customers should be treated the same way. In practice, companies adopting CRM technology have the ability to sustain significant competitive advantages by delivering value added services that respond to their customer's changing needs and preferences (Peltier et al., 2006; Zahay et al., 2004).

Recently, the literature has begun to link the practice of CRM with the development of innovation activity. Ramani and Kumar (2008) suggested that using CRM to engage in creating, maintaining, and fostering useful customer relationships along with maintaining long-term partnerships are important strategic elements for developing innovation capability. Intensive interaction between manufacturers and customers encourage customers to provide valuable suggestions for product development (Droge et al., 2004). Therefore, manufacturers who receive important information from customers are able to increase their innovation capability by meeting the needs of a targeted market (Ottum and Moore, 1997).

Finally, there is a growing consensus in the literature that the adoption of CRM technology is likely to be crucial when market conditions are characterized by high uncertainty and firms are attempting to gain competitive advantages through innovation (Papastathopoulou et al., 2007; Wang and Ang, 2004; McGee and Sawyerr, 2003).

In view of the foregoing studies, H2 is formulated as follows:

H2: Manufacturing firms implementing a CRM system are more likely to introduce any new or significantly improve their internal processes, , in comparison with their peer-group.

ICT Practitioners & Internal Process Innovation Activity

It is well known that adoption of innovation requires employee commitment and effort (Acemoglu and Pishke, 1999). In case of ICT, empirical studies have shown ICT is most productive when combined with complementary investments in working practices, human capital, and firm restructuring (Brynjolfsson and Hitt, 2000). In fact, knowledge stock and skills were found to positively associated with a firm's absorptive capacity to adopt new technologies (Cohen and Levinthal, 1989). This, in turn, has positive impact on a firm's innovation performance. Thus, in order to develop marketable products or feasible production processes based on ICT, a firm needs to build up the relevant complementary assets such as knowledge stock and expertise. The most obvious example of investments in complementary assets includes investments in training and organizational transformations to accompany ICT investments.

Consequently, these points yield the following hypothesis:

H3: Manufacturing firms characterized by a higher share of employees with ICT qualifications are more likely to realize internal process innovations, compared with their peer-group.

ICT Investments & Internal Process Innovation Activity

With ICT's increasing sophistication and usage, managers now consider the use of ICT as a competitive tool used for the implementation of strategic plans and the support of firm core competencies (e.g., Aral and Weill, 2007; Oh and Pinsonneault, 2007). Therefore, investment in ICT by firms has dramatically escalated in recent times (Devaraj and Kohli, 2003).

Using survey data, Dibrell et al. (2008) found that managers who are able to integrate either a product or a process-oriented innovation strategy with investments in ICT enhance their firms' relative performance along two essential dimensions: profitability and growth. In contrast, a failure to invest in ICT can cause a firm to be unable to support its innovation initiatives. Perhaps, a lack of investment in ICT over time may render the firm incapable of meeting customer requirements. Lastly, Brynjolfsson and Hitt (2000) have found parallel results, where they have been shown that ICT investment has a significant effect on productivity levels, productivity growth, and stock market value of firms.

In view of the foregoing arguments, H4 is formulated as follows:

H4: Manufacturing firms that make investments in ICTs (e.g. for new hardware, software or networks) are more likely to conduct internal process innovations, compared with their peer-group.

Intra-Organizational Information Exchange & Internal Process Innovation Activity

Intra-organizational information exchange is important for the creation and diffusion of innovations within complex multiunit organizations. ICT has a direct impact on process innovation in an organizational setting by facilitating inter-organizational links (Lee, 2000). ICT-enabled inter-organizational integration and collaboration enhances the innovation capabilities of companies by providing opportunities for shared learning, transfer of technical knowledge and resource exchange. Carr and Pearson (1999) pointed out that information sharing between manufacturers and their clients about markets, designs, and processes enables manufacturers to adopt technologies that can improve design and process innovative capabilities. In more recent discussion of Ru-Jen Lin et al. (2010) also verified that using information sharing has positive and significant effects on process innovation. This leads to the following hypothesis:

H5: Manufacturing firms that use ICT applications to exchange information on their inventory levels or production plans with their business partners are more likely to introduce internal process innovations, compared with their peer-group.

Relationships With Suppliers & Internal Process Innovation Activity

Supplier relations are important value chain characteristics, which are likely to influence the innovation activity of companies. The benefits of inter-firm cooperation are subject to learning effects. In order to fully benefit from integration, both parties need time to comprehend and adapt to the new organization of activities. In other words, when relationship investments are indispensable or specific assets are procured firms will create networks in which suppliers form closed business relationships. This helps to overcome hold-up problems and allows firms to create relations, which are additionally strengthened by ICT (European Commission, 2008). According to Helper and MacDuffie (2003), ICT facilitating B2B

interactions continues to be used in a way that enhances, not replaces individual companies' business strategies. Companies develop e-business tools that reinforce old paradigms for purchasing and supplier relations. This happens because there are patterns of social interaction that are deeply imbedded in systems of procurement. We thus postulate:

H6: Manufacturing firms maintaining long-term relationships with suppliers are more likely to conduct internal process innovations, compared with their peer-group.

Firm Size & Internal Process Innovation Activity

The literature offers contradictory findings about the direction and the intensity of the relation between size and innovation. On the one hand, there are studies that found significant relationships between the size of a firm and innovation (Camison-Zornoza and Lapedra-Alcami, 2004; Sullivan and Kang, 1999; Damanpour, 1992). On the other hand, however, other researchers declared that firm size had no apparent effect on either product or process improvement (Wolff and Pett, 2006). Lastly, still other work claims that no relation exists between the core variables (Aiken et al., 1980).

Against this background, our next hypothesis is:

H7: The larger the size of the business, the more likely process innovations activities will be conducted by small, medium and large enterprises.

In the next section, we discuss the methodology employed to test the theoretical model.

RESEARCH METHODOLOGY

Research Design

In order to address the preceding research questions, we used data from the 'Sectoral e-Business Survey (SeBW) 2007'. This global survey is part of the "e-Business Watch", a service launched in 2007 and provided by "empirica GmbH" to the European Commission, Enterprise and Industry Directorate General, in co-operation with renowned international partners (European Commission and the Sectoral e-Business Watch, 2007) while it was presented as a Confidentialized Unit Record File. The key objective of the SeBW is to gather information about the usage of ICT and their application to the electronic business in companies, in order to derive indicators on industrial sector level. The fieldwork was carried out from August 13 to October 08, 2007 and had a scope of 2.121 telephone interviews with decision-makers from three industry sectors (chemical, steel and furniture) in seven EU countries (UK, France, Germany, Sweden, Spain, Italy and Poland). The target respondent within the company was a person responsible for or taking part in decisions concerning the use of information and communication technologies and of e-business. This person could have been in different positions, depending on the size and kind of company or organisation – usually the IT manager or a senior professional in the IT department. Particularly in the case of larger companies, there are dedicated positions for e-business management while in micro and small enterprises, the respondent rather is someone at the level of managing director or owner. The questionnaire collected information on the background information of the firms, ICT-related characteristics (such as infrastructure, software systems, skills requirements, costs, impacts, drivers and inhibitors) and innovation activity (if any) of the firm during the past 12 months.

Sample and Data Collection

The sample drawn (for each sector) was a random sample of companies, stratified by sector and, where possible, size (number of employees in the company), was selected per country. The quality of the survey frame was of very high importance. In order to ensure the best possible quality of results in terms of raising the survey data, SeBW explicitly instructed the institutes that the sampling/ address purchase and the universe figures (sample frame) should be based to the largest possible extent on “official” business registers and company statistics, which are usually run by the National Statistical Office in the country.

Wherever possible for the drawing of the sample the same source was chosen as for building-up the universe. However, in some countries the statistical offices that were used for the universe figures were not able (resp. were not allowed) to provide the institutes with full and up-to-date addresses or telephone numbers of companies at all. In case where the sampling/ address purchasing could not be obtained directly from the respective national statistical offices, the countries used renowned address supplier of the highest possible quality in terms of coverage and up-to-dateness. This is common practise in business-to-business surveys. Furthermore, the usage of computer/PC (including desktop computers and notebooks) within the company was required in order to qualify for an interview.

The final allocation of our sample (n=914) according to industry sector and company size as well as the sample sources were used, is illustrated as follows (Table 1):

Table 1: Industry and country distribution of the sample & sampling sources

		Countries								
		Germany	Spain	France	Italy	Sweden	UK	Poland	Total	
Industry Sectors	Chemical , rubber & plastics	Count	129	26	88	43	6	74	30	396
		% within Industry Sector	32.6%	6.6%	22.2%	10.9%	1.5%	18.7%	7.6%	100.0%

		% within Industry Sector	26.3%	8.0%	16.1%	14.9%	2.7%	16.5%	15.5%	100.0%
	Sampling Sources		Heins and Partner Business Pool	Dun & Bradstreet	WEGENER DM. previously IDATA	Dun & Bradstreet	Statistics Sweden’s Business Register	Dun & Bradstreet	Hoppenstedt Bonnier Information Poland (HBI)	

This table shows the allocation of sample and sampling sources by country and industry sector.

In this survey, a cut-off was introduced with regard to company size: only companies with at least 10 employees were interviewed. The highest level of the population (at least 10 employees) was the set of all computer-using enterprises which were active within the national territory of one of the seven countries covered, and which had their primary business activity in one of the three industry sectors specified on the basis of NACE Rev. 1.1.

Weighting Schemes

Due to stratified sampling, the sample size in each size-band is not proportional to the population numbers. If proportional allocation had been used, the sample sizes in the 250+ size-band would have been extremely small, preventing any reasonable presentation of results. Thus, weighting is required so that results reflect the structure and distribution of enterprises in the population of the respective sector or geographic area. The SeBW applies two different weighting schemes: by employment, and by the number of enterprises

Measure Development & Statistical Method

In order to test the above seven hypotheses and determine the likelihood of conducting internal process innovations, a binary logistic regression analysis was applied. Table 2 details the research variables used to this study including concept, operational measure and sampling source. The raw data were coded and analyzed using the PASW Statistics 18.

Table 2: Description of Variables

Concept		Description – Operational Measure	Source	
<i>Dependent variable</i>				
Internal Process Innovation (IPI) Activity		A 0/1 dummy taking value 1 if firm had introduced any new or significantly improved their internal processes, during the past 12 months.	European 'Sectoral 2007'	Commission e-Business Survey
<i>Independent variable</i>				
Adoption of ERP (ERP)		A 0/1 dummy taking value 1 if firm had implemented ERP system.	European 'Sectoral 2007'	Commission e-Business Survey
Adoption of CRM (CRM)		A 0/1 dummy taking value 1 if firm had implemented CRM system.	European 'Sectoral 2007'	Commission e-Business Survey
ICT Practitioners (ICTP)		A 0/1 dummy taking value 1 if firm had employed ICT practitioners (persons who were hired primarily to take care of the company's ICT infrastructure).	European 'Sectoral 2007'	Commission e-Business Survey
ICT Investments (ICTI)		A 0/1 dummy taking value 1 if firm had made investments in ICT during the past 12 months, for example for new hardware, software or networks.	European 'Sectoral 2007'	Commission e-Business Survey
ICT Applications for Information Exchange (ICTIE)		A 0/1 dummy taking value 1 if firm had implemented ICT applications to exchange information on their inventory levels or production plans with their business partners, during the past 12 months.	European 'Sectoral 2007'	Commission e-Business Survey
Long-Term Relationships with Suppliers (LTRS)		A 0/1 dummy taking value 1 if firm was maintaining long-term relationships with its suppliers	European 'Sectoral 2007'	Commission e-Business Survey
Firm Size (FS)		Companies were categorized according to number of their employees into 1 = small (10-49), 2 = medium (50-249) and 3 = large (250+).	European 'Sectoral 2007'	Commission e-Business Survey

This table describes the measurement and sampling source of dependent and independent variables

RESULTS

Demographic Characteristics

As seen in Table 3, almost half of the responding firms (49.4 percent) in the sectors surveyed had implemented innovative activities during the previous year, whereas Germany, Poland and Spain shows the highest rates of 66.1%, 59.7% and 56.4% respectively. More than half (52 percent) of the responding firms have deployed an ERP system, and 47.8 percent had not. According the European e-Business Report 2008, the deployment of ERP systems has almost doubled among small enterprises from 2003 to 2007 and increased by about 20 percentage points in medium-sized and large firms (European

Communities, 2008). On the other hand, only thirty percent of the responding firms reported having a CRM system. The current adoption rates (ERP, CRM) leads us to conclude that both enterprise systems are not widely used and, of course, there is still room for improvement. Moreover, about 42 percent of the firms interviewed employ ICT specialists with Spain and France showing the lowest percentages. At this point, we have to say that there is, however, a general concern, especially among larger companies, that e-business does have a significant impact on skills requirements (European Communities, 2008). Anyway, some countries seem more aware of the value of employees with ICT qualifications. Conversely, almost 80% of the responding firms had made investments in ICTs during the past 12 months, providing strong evidence that the EU manufacturing companies are interested in full potential of ICT usage. However, according OECD (2003) investments in ICT is no panacea. Firms may well overinvest in ICT, either in an effort to compensate for lack of skills or competitive pressure, or because they lack a clear market strategy. Firms that achieve the highest returns from ICT are often those that were already performing well or had successfully innovated in the past. The electronic exchange of information between business partners is found to be of different importance for the seven countries, with Poland, Germany and Sweden to present the highest percentages. Finally, the European manufacturing firms prefer to trade mostly with long-term business partners rather than having a changing supplier base.

Table 3: Respondent Characteristics per Country ($n = 914$)

Variables		EU Countries							MEAN	SD
		Germany	Spain	France	Italy	Sweden	UK	Poland		
		%	%	%	%	%	%	%	%	%
Internal Process Innovations	Yes	66.1	56.4	41.8	40.7	43.7	37.2	59.7	49.37	11.17

This table shows respondent descriptive characteristics per variable and country. Pale blue color indicates a positive response, while the pale orange indicates a negative response.

A Prediction Model For The Factors Influencing The Development Of Process Innovations

The main goal of this study was to examine the factors affecting the development of process innovation. Since the research model uses a dichotomous dependent variable and categorical independent variables, the binary logistic regression analysis was used to validate the research model empirically. Thus, the final logit model is specified as follows:

$$\ln \left(\frac{\text{Prob}(IPI \text{ Activity} = \text{Yes})}{1 - \text{Prob}(IPI \text{ Activity} = \text{Yes})} \right) = \beta_0 + \beta_1 * ERP_i + \beta_2 * CRM_i + \beta_3 * ICTP_i + \beta_4 * ICTI_i + \beta_5 * ICTIE_i + \beta_6 * LTRS_i + \beta_7 * FS_i + \varepsilon_i$$

Logit analysis is a preferred technique because it does not assume equal variance-covariance matrices across groups and multivariate normality of the variables (Hair et al., 1998). Moreover, the output from the analysis is very similar to regression and is therefore easier to draw inferences. Logit uses a binomial probability function for the dichotomous dependent variable and estimates whether it is one way or the other using an odds ratio. Unlike regression, where we try to minimize the squared deviations, in logit we maximize the likelihood of a firm adopting IS innovations (Premkumar, 2003).

As shown in Table 4, all dimensional hypotheses were supported. The likelihood-ratio test is used instead of Wald statistics (the square of the ratio of the parameter estimate to its standard error) because the Wald statistics has undesirable properties. For large coefficients, the standard error can be too large, resulting in Wald statistics that are too small. That is, we may fail to reject the null hypothesis when it is false (Norusis, 2008). For that cause, the likelihood-ratio test was chosen. The overall model's fit is significant ($p < 0.001$).

Table 4: Logistic Regression Results

Independent Variables	Hypothesis	Coef (β)	Likelihood Ratio Chi-Square	Sig.	Exp(β)
Constant		-2.892	0.110		
Adoption of ERP (ERP)	H1	0.445**	4.738	0.029	1.561
Adoption of CRM (CRM)	H2	0.862***	18.755	0.000	2.369
ICT Practitioners (ICTP)	H3	0.434**	5.276	0.022	1.543
ICT Investments (ICTI)	H4	1.189***	22.169	0.000	3.284
ICT Applications for Information Exchange (ICTIE)	H5	0.865***	14.298	0.000	2.375
Long-Term Relationships with Suppliers (LTRS)	H6	0.693**	4.147	0.042	2.001
Firm Size (FS)	H7	2.329***	18.918	0.000	10.266

This table shows the logistic regression coefficient, likelihood-ratio test, and odds ratio for each of the predictors. Employing a 0.05 criterion of statistical significance, all variables had significant partial effects. The overall model's fit is significant ($p < 0.001$).

** The estimated regression coefficients are significant at the 0.1 level.*

*** The estimated regression coefficients are significant at the 0.05 level.*

**** The estimated regression coefficients are significant at the 0.01 level.*

The repressors' are not directly of interest in statistics but the exponent of each term is the odds ratio and thus reveals the contribution of each term in the probability for an EU manufacturing firm to introduce an IPI. The term 0.445 when exponentiated gives $\exp(0.445)=1.56$. This means that the odds of introducing an IPI, for a firm, which has implemented an ERP system, are 1.56 times the odds for a company that has not. Similarly, the odds of introducing an IPI, for a firm, which has implemented a CRM system, are 2.37 times the odds for a company that has not. Moreover, the odds attributes to ICTP, ICTI and ICTIE are equal to 1.54, 3.28 and 2.37 respectively. This gives a clear indication that the odds of introducing an IPI, for a firm, which has employed ICT practitioners, has made investments in ICTs and has deployed ICT applications for information exchange with the business partners, are correspondingly 1.54, 3.28 and 2.37 times the odds for a company that has not. Likewise, the manufacturing firms which maintain long-term relationships with suppliers are more likely (2 times the odds) to conduct internal process innovations, compared with their peer-group. Finally, the odds of introducing an IPI are excessively rising (10.27 times the odds) according to the employment size of the firms.

DISCUSSION

The findings of this study extend the innovation literature and help build a foundation for further understanding the factors, which are found to be critical in IPI activity of manufacturing firms. From the results, we are able to make multiple observations. First, our findings provide strong support for H1 that manufacturing firms implementing an ERP system are more likely to introduce any new or significantly improve their internal processes ($p = 0.029$). This is in line with previous studies (e.g. Papastathopoulos and Beneki, 2010; Davenport et al., 2004; Davenport and Brooks, 2004), indicating that the deployment of an ERP system contributes to firm's internal process innovation activity. Second, the results reveal (H2) that firms implementing a CRM system have a greater propensity ($p < 0.0001$) to introduce any new or significantly improve their internal process activities. This is consistent with prior studies (e.g. Ramani and Kumar, 2008; Papastathopoulou et al., 2007; Wang and Ang, 2004; McGee and Sawyerr, 2003). CRM is touted as an imperative strategy to improve a firm's innovation activity. Manufacturing firms must carefully align their CRM practices with the specific types of innovation capability they desire to

possess (Ru-Jen Lin et al., 2010). Third, the regression results point to strong support for H3 that manufacturing firms characterized by a higher share of employees with ICT qualifications are more likely to realize an internal process improvement ($p = 0.022$). ICT-practitioners with very specific skills seem to be of crucial importance. This is consistent with the observation that the success of the ICT-driven innovation processes relies on the availability and quality of complementary assets such as labor (Brynjolfsson and Hitt, 2000). Logically, this suggests that firms have to employ ICT practitioners who are qualified to effectively incorporate ICTs into innovation activities. Apparently, firms that do not employ ICT professionals have fewer chances to be innovative. Fourth, the results (H4) with respect to investments in ICT have been found to be a significant factor influencing introduction of process innovations ($p < 0.0001$). This is consistent with results from previous research that have found ICT investment to be a significant effect on innovation activity of firms (Brynjolfsson and Hitt, 2000).

Investments in ICT can enable process innovations if the implementation of new ICT succeeds, the routines are changed and the new system is actually utilized European Commission (2006). Empirical studies have stressed that ICT investments must be combined with complementary investments in work practices, human capital and firm restructuring to have an impact on performance (Brynjolfsson and Hitt, 2000; Greenwood and Jovanovic, 1998). These complementary investments that are usually not counted as ICT specific lead to comparatively high returns to ICT investment (Brynjolfsson and Hitt, 2003).

Clearly, this factor warrants more attention from future researchers working in this area. Fifth, the results (H5) indicate towards a close link between IPI activity and the extent to which firms exchange information electronically ($p < 0.0001$). Consistent with Carr and Pearson (1999), Lee (2000) and Ru-Jen Lin et al., (2010), intra-organizational information exchange is important for the creation and diffusion of innovations within complex multiunit organizations. Frequent and close interactions allow actors to know each other, share important information, and create common ideas (Ru-Jen Lin et al., 2010). Sixth, based on regression results (H6) we can confirm that long-term relationships with suppliers has been found to be a significant factor influencing firm's IPI activity ($p = 0.042$). Last but not least, the results show strong support for H7, indicating that firm size has been a fundamental variable, and larger firms have a greater propensity to conduct a process innovation ($p < 0.0001$). On the one hand, these findings corroborate the views put forth by Camison-Zornoza and Lapiedra-Alcami (2004), Sullivan and Kang (1999) and Damanpour (1992) that firm size associates with firm's innovation activities. On the other hand, our results contradict the findings of the study conducted by Wolff and Pett (2006).

Summarizing, the results suggest that the development of IPI activities could be further enhanced by the implementation of ICT-software systems (ERP & CRM), the employment of ICT-qualified personnel, the investments in advanced technologies, the efficient flow of information between business partners and the long-term relationships with the suppliers. Moreover, the study makes clear the need to blend together the dictates of technology and innovation management techniques to make manufacturing firms more competitive. Based on the evidence presented in this cross-country empirical study, ICT remains an important variable both for strategic management and for policy aiming at improving business performance and economic progress. In many sectors and firms, the innovative potential of ICT has not yet been fully exploited. This implies that technologies can still be used to influence a firm's ability to gain a competitive advantage (e.g., Dibrell et al., 2008) through the linkage of ICTs with firm's strategy. As a conclusion to this discussion, the EU manufacturing industries have to closely intertwine their innovation strategies with those related to ICT in order to reap future tangible and sustainable benefits.

CONCLUSION, IMPLICATIONS AND FUTURE RESEARCH

This multi-country empirical research provides an understanding of the factors that influence the Internal Process Innovation (IPI) activity of the European manufacturing firms. Moreover, a predictive model was

developed that can be used to predict which manufacturing firms are more likely to introduce any new or significantly improve their internal processes.

The major contribution of this study is statistically validating the factors influencing internal process innovation activity of EU manufacturing firms. Thus, it can be predicted that manufacturing firms with greater implementation of Enterprise Systems (ERP & CRM), greater share of employees with ICT qualifications, greater investments in ICTs, greater ICT applications to exchange information on their inventory levels or production plans with their business partners, greater long-term relationships with their suppliers and a larger size are more likely to introduce any new or significantly improve their internal processes.

This work is not free from limitations. Taken that the findings in this study are based on seven selected European countries, they cannot be generalized to other countries. The analytical investigation of hypothesized associate influences have been approached from a European point of view. Thus, the interpretation and utilization of the research findings should be thoroughly scrutinized. Additionally, this study focused on three industries only. It would be interesting to see whether firms in other industry sectors are influenced by the same factors.

The above results provide a starting point for future studies on this important topic for scholars and practitioners. Practitioners can use this model to increase the development of IPI among their firms, while researchers can replicate the same study in other aspects of innovation scope, such as product innovation, marketing innovation, service innovation, and administrative innovation. Future research may use other techniques such as structural equation modeling (e.g. Ramdani and Kawalek, 2009) to investigate the interaction among the variables.

THE IMPACT OF GENDER ON STRATEGIC TYPOLOGY IN THE HOTEL INDUSTRY IN CANADA

Candace Blayney, Royal Roads University
Karen Blotnick, Mount Saint Vincent University

ABSTRACT

This research explores the impact of gender on managerial styles, especially the strategic typology employed by hotel managers in Canada during stressful economic times. Miles and Snow's strategic typology framework of defender, prospector, analyzer and reactor was employed and explored by gender. Also, performance was examined by strategic typology to determine any relationships. Findings in this study indicated that women hotel managers had higher ratings for the defender strategy and men had higher ratings for the analyzer strategy. There were no statistically significant findings regarding which strategy had the best performance outcomes. Implications of this study and further research are discussed.

INTRODUCTION

The environment may account for a certain degree of poor performance; however, quality of performance is primarily due to the strategy employed by the general manager. "Research has shown that industry conditions account for approximately 19% of a firm's performance, while developing a sound competitive strategy is responsible for 32% of performance results" (McGahan & Porter, 1997, p.16). The past years of economic uncertainty for the hospitality industry in Canada presented a unique opportunity to capture strategies used to maintain operational viability.

As of 2004, consultants for the Hotel Association of Canada reported that the Canadian hotel industry consisted of 6,434 properties and 363,628 rooms. The resulting revenues generated were in excess of CDN \$11 billion. Employment included over 238,000 people with total salaries and wages estimated at \$4.6 billion. Revenues generated for the government were approximately \$4.03 billion (HAC, 2004, The Hotel Industry Fact Sheet).

The skills required of a hotel general manager are demanding due to the unique characteristics of the industry. This is because, typically, hotels operate 24 hours per day, seven days per week, and 365 days per year. Occupancy levels fluctuate significantly by season, there are high labor costs, and unique management skills are required to motivate a highly diverse staff. Compared to managers in other industries, these job characteristics may exert increased daily management pressures on hotel managers (Rutherford, 2002).

The environment in the hotel industry during 2000 to 2006 was turbulent due to terrorism, public health concerns such as Severe Acute Respiratory Syndrome (SARS), Bovine Spongiform Encephalopathy (BSE or Mad Cow), forest fires, wide spread power outages, and severe weather and snowstorms (Hotel Association of Canada Annual Report, 2004). The resulting revenue loss created a challenging environment which has continued with the financial slide that started in 2008.

This quantitative research was designed to identify the strategies used by general managers during the adverse economic conditions that prevailed in the Canadian lodging industry from 2001 to 2006 and to determine if there were any differences according to gender. This exploration will uncover any lessons that can be learned from managers who experienced this turbulent environment.

LITERATURE REVIEW

Strategy

The study of strategy is dependent on the idea that strategy should be aligned with the external environment for the best performance. One of the original researchers linking strategy, structure, and process to organizational adaptation resulted in the textbook *Organizational Strategy, Structure, and Process* (Miles & Snow, 1978). A strategy typology was defined to assist organizations in making changes to adapt to the environment. The strategy typology contains four types of strategic management categories: *prospectors*, *defenders*, *analyzers*, and *reactors*. Prospectors perceive the environment as dynamic and uncertain, and use innovation to manage the environmental change. Their success is based on finding and exploiting new products and market opportunities. They constantly seek new opportunities and will look at many diverse markets and tend to be aggressive. The opposite of prospectors are defenders who perceive the environment as stable and certain. Defenders seek stability and control and create a highly specialized and formalized organizational structure. Therefore, defenders have little capacity to adjust rapidly to new opportunities. Instead, they attempt to locate and defend a secure niche in the market place which is seen as stable and thus appear to be non-aggressive. Analyzers are a unique blend of the prospector and the defender, minimizing risks and maximizing opportunities. They stress both stability and flexibility and try to capitalize on both by maintaining their traditional products but also, introducing new ones. Analyzers may follow the lead of the prospectors, thereby avoiding their own marketing research expenses. The fourth typologies, reactors, lack consistency in their choice of strategy and therefore tend to perform poorly (Miles & Snow, 1978).

Research has linked strategy typology to performance. Aragon-Sanchez & Sanchez-Marin (2005) found small and medium enterprises (SMEs) in the manufacturing industry and in the construction industry that used prospector orientation performed better than defenders. Also, this research found the prospector strategy type out performed the analyzers. Desarbo, De Benedetto, Song & Sinha (2005) suggest that prospectors perform better in dynamic environments as they tend to search and compete for opportunities and use innovation to bring new products to the market quickly. Defenders tend to find a niche and maintain it rather than search for new opportunities. If environmental changes do not affect this niche, their performance would remain stable; however, defenders are not equipped with high research and development resources and processes to react if the need arises.

In an environment such as the Canadian hotel industry faced in 2006 the decrease in revenues would have put the hotels into a crisis mode. The Upper Echelon (UE) theory proposes that there is a very strong relationship between executives and the performance of their organization (Carpenter, Geletkanycz & Sanders, 2004). The executive in the hotel industry is the general manager who directs the team and “holds the key executive position in the hotel industry” (Ladkin, 1999, p. 167). This research postulates that the particular strategy chosen by the general manager would have an impact on the hotel’s performance.

Performance in the hotel industry is measured by common financial metrics including occupancy, which is a percentage calculated by dividing the number of rooms sold by the number of rooms available, average daily rate (ADR), calculated by dividing the revenue by the number of rooms sold, and revenue per available room (RevPAR), calculated by dividing the total revenue by the number of rooms available for sales. Revenue per available room, RevPAR, is “often considered the most critical measure of operating performance and by definition encompasses an element of rate and rooms supply” (Enz, Canina & Walsh, 2001, p 27).

Gender

Men and women in managerial positions use different techniques and demonstrate different competencies as research indicates (Soehanovic et al, 2000; Powell, 1993; Burgess, 2000; and Schaap, Stedham and Yamamura, 2008). In Canada there is an absence of significant representation of women in management and the hospitality industry is one with a long established history of male dominance (Maxwell, 1997). According to Wood and Viehland (2000) this “pink-collar ghetto still exists” (p. 51) and especially in hotels over 500 rooms where only 2.6 percent of the hotel managers in the United States were identified as women (p. 51).

Women in management in Canada represent 36.4% as of 2006. Only 26.4% of senior management occupations are female and only 14.4% hold a position as a Financial Post Corporate Officer. The percentage of Financial Post 500 board seats held by women is a mere 11.2% (Catalyst, 2008). This low representation exists when the overall labor force is 46.9% female. In the accommodation industry in Canada, the employed labor force is even greater at 60.5% female, with 52% of accommodation managers being female (Canadian Tourism Human Resource Council (CTHRC), 2004). Gender statistics of hotel general managers in the hotel industry in Canada, specifically, were not found.

The topic of diversity and its benefits to organizations has been well researched. Catalyst is a leading research organization working to advance women in business and has examined the connection between gender diversity and the financial performance of the organization. Catalyst examined 353 Fortune 500 companies, and found that there is a connection, and “The group of companies with the highest representation of women on their top management teams experienced better financial performance” (Catalyst, 2008, p. 2). This performance was significant with Return on Equity at 35.1 percent higher and Total Return to Shareholders at 34.0 percent higher (p. 2).

There are more than just financial benefits in creating a more gender diverse workforce. The first of these is women’s increasing managerial presence. They hold 35.3% of total managerial positions but hold only 30.5% of the senior management occupations (Catalyst, 2008). They also have an advantage in education as they earned 61.8% of bachelor’s degrees, 51.8% of master’s degrees and 44.0% of doctorate degrees (Statistics Canada, 2008). The second benefit is related to the increasing labor shortage that is forecasted for the hospitality industry in Canada “...models indicate that net immigration must reach a total of 2.0 million between 2003 and 2013 – or about 200,000 per year on average – if there are to be enough people between the ages of 15 and 64 in 2013 to permit Canada to fulfill its employment potential” (CTHRC, 2004, p. 39). Women represent 46.9% of the total labor force so hiring women will create a diverse workforce and allow employers to tap into a large talent pool. This diverse workforce leads to a third benefit that directly impacts hotels. New product developments and overall product improvements that would relate to the growing female business traveler would create a competitive advantage. In 2000 the Canadian Travel Survey reported that women took over 5.8 million domestic business trips in Canada and they are more likely to extend their trip while traveling on business (Smith, Carmichael, 2006, p. 65). Product and service extensions could substantially increase the length of stay per business traveler and directly affect the financial performance of a hotel. Also, specialized packages and value added activities could be created for this growing female market.

The characteristics of women managers compared to male managers have been researched and the results indicated that differences do exist. Females were rated higher on interpersonal behaviors than were males at the middle and executive levels (Bartol, Martin & Kromkowski, 2003) and women were found to be more oriented toward supporting and maintaining relationships than men (Hisrich and Brush, 1994). Rosnener (1995) found women also tend to be strong in idea generation and innovation and discovered three differences in women’s managerial styles compared to men. One, women encourage participation and share decision-making with others; two, women share information and power; and three, the

combined participation and sharing enhances self-worth in others and creates an interactive management style. Soehanovic, Zougaj, Krizoman and Bojanic-Glavica (2000) researched characteristics of women managers in hotels and found in order to be successful they demonstrated knowledge in these areas: (1) organizational knowledge (97.14%), (2) manner with people (91.43%), (3) management knowledge (77.14%), (4) knowledge of the economy (71.43%), (5) financial knowledge (54.29%).

The career paths of women are also different from those of men. Women tend to progress through careers with less moves and number of positions. In the hotel industry in Canada, it was found that women manage the majority of the smaller and lower star rated properties (Blayney & Blotnick, 2010). In New Zealand and Australia, research on women in the hotel industry found barriers to promotion that included “long hours” culture, the old boy’s network, hiring practices and geographical mobility (Mooney & Ryan, 2008).

Which strategic typology will women chose most often? Will their focus on process and participation lead them to use the defender strategy as compared to the prospector strategy which entails searching for innovation and improvements? Does their career path, which differs from men’s, restrict their choices due to lack of experience with the more aggressive roles? Johansen (2007) found that women are more likely than men to use the defender or reactor strategy and men are more likely to use the prospector strategy. Further, Johansen (2007) found that women managers had more success with the prospector strategy when compared to male managers. This may be due to the fact that women are more interactive and use valuable input and advice rather than make decision on their own. Other studies have also found that men tend to be more concerned with positions of dominance and formal power and women like to use a more interactive style and are open to more feedback from colleagues and associates to find innovative ideas.

METHDOLOGY AND DATA

With the continued increase of women management positions and the increased focus on diversity, this timely research examined the strategy typology employed by women managers compared to men during economic stressful times in the hotel industry in Canada. Based on the literature review addressing strategic typologies and gender differences in management styles, the following hypotheses were created:

H1: There will be statistically significant differences for the strategic typology as measured by the Miles and Snow strategy typology by gender.

H2: There will be statistically significant differences for Revenue per available room (RevPAR) based on the Miles and Snow strategy typology used.

H3: There will be statistically significant differences for Occupancy (Occ) based on the Miles and Snow strategy typology used.

H4: There will be statistically significant differences for Average Daily Rate (ADR) based on the Miles and Snow strategy typology used.

A survey was directed to accommodation general managers of Canadian hotel properties with 30 rooms or more using a distribution list compiled from the Hotel Association of Canada membership directory, provincial hotel associations, membership lists and corporate hotel groups. The survey included basic demographics and the previously validated Miles and Snow 11-item strategic typology scale developed by Conant, Mokwa, & Varadarajan (1990). The survey was posted on a web page and emails were distributed to the general managers containing a hyperlink to the survey.

The hotel industry in Canada consists of 6,581 lodging establishments (Hotel Association of Canada, 2004) of which 3,464 operate on a year round basis and contain at least 30 rooms. This criterion is used by KPMG LLP, the consulting company that collects statistics on the Canadian hotel industry for the Hotel Association of Canada. This same criterion was used for this research.

Data were analyzed using t-tests and analysis of variance to test the hypotheses. There were slight deviations from normality in the data, however, the assumption of homoscedasticity was not violated. Repeated attempts to transform the data to make it normally distributed across variables were unsuccessful. Given that analysis of variance is robust to slight differences in normality and variable transformations were not successful in creating normally distributed data, the decision was made to keep the variables in their original form.

RESULTS

The hotel associations and corporate hotel groups that agreed to participate and circulate the survey to their managers involved a total of 952 general managers. The responses totaled 184 completed surveys of which 183 were usable and gave a response rate of 19.2%.

The sample consisted of 112 male general managers (61.5%) and 70 female general manager (38.5%). One respondent did not disclose their gender. Most were graduates of a two-year college program (38%), or university undergraduate degree (33%). Sixteen percent had completed a high school diploma, while 3.8% had postgraduate university degrees. Three percent had other forms of post secondary training. The average age was 43.9 years and they had been in management positions for an average of 16 years of in the position of general manager for an average of 6.9 years.

Most general managers were responsible for smaller properties which made up over half of the sample. Properties ranged from 30 to upwards of 475 rooms. Most properties were located in downtown areas, followed by suburban locations. Most employed between 11 and 300 staff members.

The responses were stratified according to the strategy typology. The association of gender with strategic typology was tested using t-tests. The association between the strategic typology and each of the performance measures (RevPAR, ADR, Occ) were measured using One-Way Analysis of Variance. The results revealed that there was a statistically significant relationship between the defender and analyzer strategy typologies. Males had higher average analyzer typology ratings and females had higher defender typology ratings. However, the analysis also revealed that there was no statistically significant difference between typology strategies and any of the performance measures: RevPAR, Occ, or ADR. The results are summarized in Tables 1 and 2.

Table 1: Differences in Strategic Typology Rating by Gender

Variable		Number	Mean	Std. Deviation	t-value (df)
Analyzer	Male	102	3.10	1.93	1.959 (165)**
	Female	66	2.92	2.11	
Prospector	Male	101	3.59	1.48	0.549 (166)
	Female	66	3.11	1.70	
Defender	Male	102	2.44	1.45	-2.314 (110.5)*
	Female	66	3.10	1.96	
Reactor	Male	102	1.87	1.45	-0.028 (143.9)
	Female	66	1.88	1.38	

*Significant at the .10-level ** Significant at the .05-level. Sample size = 168/183 respondents.

This table shows the differences in the strategic typology rating according to gender.

Table 2: Differences in Performance Measures by Strategic Typology

Strategic Typology x RevPAR	Number	Mean	Std. Deviation	F-Ratio (df)
Analyzer	52	\$75.05	\$23.65	0.716 (3/140)*
Prospector	44	83.06	33.05	
Defender	28	76.41	30.51	
Reactor	20	80.66	26.45	
Total	144	78.54	28.44	

*Significance > .10. Not statistically significant. Sample size = 144/183 respondents.

This table indicates the differences in performance by strategic typology and shows there are no statistically significant differences.

DISCUSSION

Hypothesis 1 was confirmed in this research as there were significant statistical differences found on strategic typology according to gender. Men were found to use the analyzer strategic typology and women used the defender approach. Analyzers share the traits of both the defender and the prospector and will defend a limited range of products within the niche market. Analyzers will also initiate new product or market development but this would take time as most organizations do not have the resources to do both. Analyzers will come later to the market with a product that is already proven by the prospectors. The defender strategy used by the female general managers could have been the reaction to a decrease in resources that came about from the restricted revenue streams caused by environmental elements. They could have been attempting to decrease risk in an extremely unpredictable marketplace and protect their current customer base. This would lead them to use more of a defender strategy.

The finding in this research of women tending to use the defender strategy agrees with those of Johansen (2007). The focus on process and participation leads them to use the defender strategy. However, the same research also indicated men tend to use the prospector strategy whereas the findings of this research found them using the analyzer strategy. Johansen (2007) also found that if women use the prospector strategy, they are more successful. The reasons are that women tend to be more interactive in their management styles and this allows them to collect more ideas from their colleagues and associates where as men tend to act on their own ideas. The reason for men using the analyzer strategy in this research may be explained by the manager's perception of the need to protect the current business base but at the same time, create some new products to find a competitive advantage in the tough marketplace. Current research on hotels in the United States was conducted from December 2009 to February 2010, a time of the Great Recession and found the number one strategy was discounting, followed by marketing initiatives, obscuring room rates and cutting costs. Rate obscuring tactics usually involved assembling value-added packages (Kimes, 2010). These tactics would fit under the strategic typology of analyzer as both new products and cost cutting show a blend of the defender and prospector strategic typologies.

Hypothesis 2, 3, and 4 were not confirmed in this research as no significant differences were found between the strategic typology and the performance as measured by revenue per available room, occupancy or average daily rate. This does not follow the theory in which "prospecting is likely to be advantageous in a turbulent or unpredictable environment because this strategy involves external scanning for new opportunities and flexible structures and processes that facilitate responses to constantly changing circumstances" (Meier et al, 2010, p. 165). Also, Miles and Snow (1978) original theory posited that any of the three strategic typologies of defender, prospector or analyzer would perform well as they tend to be a more stable type than the reactor. The reactor's frequent inconsistent ability to adapt to the environment would long term lead to lower performance compared to the other three strategies.

Research has been completed to investigate education and age and its alignment to the performance of the different strategic typologies. Although age did not affect the performance level for either prospector or defender, tenure and job tenure were statistically significant for both prospectors and defenders (Sebaa, Wallace & Cornelius, 2009).

Further research is required to explore the concept of women who use the prospector strategy and if it does correlate to better performance. As women have barriers in their careers to reach executive positions, do they also have barriers that lead them to use the defender strategy instead of the prospector strategy which is more aggressive in nature? There is a need to understand the framework of interactions of environmental factors, gender and strategy and the impact on performance.

BIOGRAPHY FOR EACH AUTHOR

Dr. Candace Blayney received her PhD in Business Administration with Specialization in Human Resource Management from Northcentral University, Arizona. Candace's research interests lie in the areas of the hotel industry and human resources and she has ten years experience with an international hotel company at the executive level. She is currently Associate Professor at the School of Tourism and Hospitality Management at Royal Roads University in Victoria, British Columbia.

Dr. Karen Blotnick is Associate Professor in the Department of Business and Tourism at Mount Saint Vincent University in Halifax, Nova Scotia. She specializes in marketing and is also President of TMC The Marketing Clinic, a full service marketing research and consulting firm. She has worked in applied research for over 25 years. Her current research interests include the role of marketing orientation and its impact on success for both private enterprise and non-profit organizations.

TAXATION OF CAPITAL INCOME IN THE CZECH REPUBLIC

Karel Brychta, Brno University of Technology
Pavel Svirak, Brno University of Technology

ABSTRACT

The paper describes the history in the legal regulation of taxation of individuals in the Czech Republic. The category of incomes in focus is the category of capital income. The comparative analysis covers the period from 1993 to 2010. On the basis of a realized comparison, one may observe that many changes in the relevant legal regulations took place during the period 1993-2010. Some of them were realized on the level of the Section 8 of the Act on Income Taxes itself (partial tax base "Capital Income"), the others took place in related provisions affecting the system of capital assets taxation.

JEL: H2; K3

KEYWORDS: capital income, capital investment assets, Czech Republic, taxation

INTRODUCTION

When discussing incomes of natural persons, another category besides income from employment and income from business also plays an undeniable role – income from capital. In principle, separate definitions of this income category are contained in legal modifications of an entire series of nations (see for example Kesti (2009)). One may also say that it is possible to identify a series of similar and sharply differing features in legal regulations of taxation on the income category in question (ex. in the wording of the definition of the type of income, method of establishing taxable income and the amount of applied tax). This last point may at least be partially attributed to the fact that in the area of natural person taxation, the sovereignty of each individual state appears in significant measure in the wording of the right to establish their own rules for taxing incomes earned within their territories, or earned by their tax residents (or citizens). However, international obligations may to a certain extent eliminate this sovereignty (concluded bilateral and multilateral agreements) and in the case of Member States of the European Union (hereinafter "EU"), also the obligations of a Member State in line with EU law.

The issue of capital income taxation is a very broad topic. This paper deals with a relatively closely defined area. Its aim is to describe development of capital income taxation of natural persons in Czech legal regulations (legal regulations *Lex lata*) from 1993 to the present. The choice of the year 1993 was not random. From the aspect of taxation of natural person income, this year was generally very important, because Act no. 586/1992 Coll., on Income Taxes, as amended (Czech Income Tax Code - hereinafter ITC), assumed validity and came into force on January 1, 1993, which unified the then-fragmented legal amendment of taxation on natural person income.

The authors feel that recognizing the development of legal regulations will enable not just understanding the current situation better, but also to better extrapolate considerations about the future and desired state (so-called legal regulations *Lex ferenda*). Besides this, one may also utilize such attained findings for comparison with legislative regulations in other countries. Results of the performed comparative analysis in the development of capital income taxation in the Czech Republic may also be interesting by virtue of the fact that only around 20 years ago, the Czech Republic began its transformation process of the migration from a planned economy to a market economy – it is thus a representative of so-called

transformation economics, for which certain specific features apply (like frequent and far-reaching legislative changes relating to the change of the social conditions and the need to reflect them in law).

This paper is divided into several parts. The first part contains a brief introduction. Section 2 presents selected findings gained from literary research aimed at questions relating to the issue of capital income taxation. Section 3 provides the actual results of the performed comparative analysis for the legal regulations of capital income in the ITC. This comparison concentrates chiefly on comparing relevant provisions of the ITC with the fact that attention is also focused on taxation of the income category in question upon existence of an international element. During the actual comparison, the legal status was taken into consideration that was valid and effective to December 31 of the applicable year; for the taxation period of 2010, this concerned the legal status valid and effective to October 30. The computerized legal information system ASPI was applied to gain information on the relevant legal status. Section 4 introduces the basic starting points for determined mathematical models, whose task was to describe important changes performed at the level of capital income taxation of natural persons. Section 5 presents outputs in graphs along with appropriate commentary. The last part of the paper, Section 6, includes the reiteration of defined objectives, a short summary of the methodology and achieved conclusions. The last section also includes indication of the limits of the paper and the relating areas offered for further research activity.

LITERATURE REVIEW

The technical literature focuses on the issue of capital income and its taxation from many aspects and from the viewpoint of various entities. It seems that dividends command the most attention in relation to capital income. This is understandable since investments in shares are a relatively ordinary and widespread investment in the globalized world today, which rightfully draws attention of current or potential investors and more.

Through efforts to perform a comparative analysis at the level of legal regulations of applicable countries, we may and do find certain problems, because the category of *capital income* need not be defined exactly the same way. A question remains besides this of how to appropriately label (name) the applicable income category. In this regard, it is worth mentioning the position of Vančurová & Láchová (2010, p. 152). These authors point out that capital income in the Czech ITC, but for minor exceptions, constitutes income from holdings of financial assets, i.e. ordinary and not capital income.

In his paper dealing with capital income taxation reform in India, Uppal (2009) presents, albeit in differing contexts, income that is definitely not found in the provision amending capital income in the Czech ITC. In the group of incomes referred to as capital income, there is a series of other incomes even in the case of nations that are geographically, historically and culturally closer to the Czech Republic.

But on the other hand, the legal regulations contained in the Slovak Act no. 595/2003 Coll. on Income Tax, as amended (hereinafter Slovak ITC) are very similar to Czech legal regulations. This namely concerns its Sec 7, which is also termed *capital income*. Of course, this is but a natural consequence of the common legal foundations for both ITCs, the Czech and Slovak ITC respectively. On the other hand, substantial differences exist. In the wording of Sec 3(2)(c) of the Slovak ITC, the shares in profit (dividends) paid out from the profit of a business company or a cooperative determined for distribution to persons having ownership interest in the registered capital, and incomes similar to it, are not the subject to taxation. In defining capital income, Czech legal regulations are highly similar to, for instance, Polish legal regulations. Article 17 (Polish legal regulations apply the term *artykuł*) of the Polish Natural Person Taxation Act contains definition of capital income, which in many aspects in defining types of income overlaps with the Czech ITC (for more information see Brzeszczyńska, S. et al. (2009, p. 336)).

Regarding the method of taxing capital income, if we approach expansion of this income category to include other types not introduced in the Czech ITC and if we focus on legal regulations in European countries, there exist in principle two basic methods of taxing this type of income. It either is taxed directly in the aggregated tax base, or is subjected to taxation separately (see Kesti (ed.), 2009). If we mention European countries, we understandably must not omit the EU and related questions.

As Týč (2010, p. 250) points out in the context of the description and assessment of EU tax policy, the arrangement of tax systems of individual nations differs significantly, which is attributed to a number of factors. These include for instance historical traditions, the system of introduced financial bodies, sociological factors or economic conditions. In terms of natural person income tax, EU intervention is minimal when compared to the area of indirect taxes. Although it is not possible to deny a certain movement in this area as well, because a number of directives have been adopted that also affect the sphere of direct taxes.

Mitu (2009, p. 67), who in his paper deals with the issue of tax competition with focus on the European Union, stresses the fact that in the past, governments had much greater freedom in determining taxes, caused by major barriers against free movement of capital and persons. Nevertheless, the influence of rising globalization decreased these barriers and they are constantly decreasing. This then legally leads to an increase in capital flows, as well as greater work force mobility. If this applies worldwide, then even more so does it apply of course for the EU, which represents a kind of supranational body founded upon four basic freedoms – freedom of movement of goods, services, persons and capital. Inappropriate legislative taxation regulations may understandably create barriers to achieving these freedoms, whether consciously or subconsciously.

All the same, one may mention the stipulation that the amount of capital income tax strongly influences the decision-making of an investor and may influence the resulting price of assets. However, as pointed out by Dai, Z. et al. (2008, p. 709 – 710), measuring the effect of taxes on the price of assets may be very complicated and altogether difficult. Aside from this, the authors refer to the fact that technical literature has pointed out that despite being intriguing in theory, only small progress has been made in proving the fact of whether taxes influence the price of assets.

From the performed literary research, from which part of the findings is presented above, it was found that relatively little attention has been paid to the issue of a description and assessment of the system of taxing capital income over a longer period in legal systems of individual countries. This paper attempts to at least partially fill in the existing gap, specifically for the Czech legal system.

CZECH ACT ON INCOME TAXES (ITC) – CAPITAL INCOME TAXATION

Right from when the Czech ITC came into effect (January 1, 1993), capital income of natural persons was defined in a separate provision, namely in its Section 8. Of course, this provision and relating provisions experienced a number of modifications over the monitored period. This paper touches upon the most fundamental of these. In this paper, the authors concentrated on capturing the fundamental changes in defining capital income, the conception of taxable income (brutto vs. netto income) and the method of taxation of the type of income in question. Special attention also focuses on the situation where an international element exists, specifically where a tax non-resident of the Czech Republic earns income. Table 1 below presents the types of capital income defined in Sec 8 ITC (name of provision *Capital Income*).

Table 1: Definition of incomes falling into capital income pursuant to Sec 8 ITC

Type of income	Period						
	1993	1994	1995	1996 - 1997	1998 - 2000	2001 - 2003	2004 - 2010
Profit-sharing (dividends)			✓				-
Interest and other emoluments from securities			✓				-
Interest and other emoluments from participation in limited liability companies and limited partnerships			✓				-
Profit-sharing and similar benefits of membership in cooperative associations			✓				
Profit-sharing (dividends) from ownership interest in corporations, limited liability companies and limited partnerships, profit-sharing from membership in an association and also interest and other income from security holdings			-			✓	
Income from settlement to partner, who is not party to a contract (hereinafter "outside partner"), achieved on the basis of a contract on transfer of profit pursuant to a special legal regulation (hereinafter "profit transfer contract") or controlling contract pursuant to a special legal regulation (hereinafter "controlling contract")				-			✓
Profit-sharing of a silent partner from participation in business, if such profit is not used for replenishing a deposit reduced by shares in losses back up to the original amount				✓			
Interest, winnings and other income from deposits in savings books, certificates of deposit and from holding deposits including interest from funds in a deposit account				✓			
Late payment interest, late charges			-			✓	
Insurance benefits in the event of reaching a certain age or from pension insurance outside of the social security fund, less the insurance premium paid	✓				-		
Insurance benefits in the event of reaching a certain age, less the insurance premium paid	-			✓		-	
Private life insurance benefits after reduction according to paragraph 8			-			✓	
Other income from insurance of persons, which is not indemnification and does not constitute termination of the insurance policy, after reduction according to paragraph 7				-			✓
Insurance and other income from provided loans and advances, interest from deposits in current accounts and interest from the value of a paid deposit at the agreed amount of shareholders of public business companies			✓			-	
Interest and other income from provided loans and advances, late payment interest, late charges, interest from the right to call, interest from deposits in current accounts with the exception pursuant to Sec 7(a) and interest from the value of a paid deposit in the agreed amount of shareholders of business companies (note: <i>the provision of Sec 7(a) ITC amends tax determined by lump-sum amount</i>)			-			✓	
Discount amounts of bills of exchange	✓				-		
Income from bills of exchange (ex. discount amounts of bills of exchange, interest from bill sum)	-			✓			-
Interest and other income from bills of exchange holdings (ex. discount from amount of bill of exchange, interest from bill sum)				-			✓
Supplemental pension insurance benefits with state contribution less paid contributions and less the state supplemental pension insurance contribution	-			✓			
Special categories of income							
Difference between paid nominal value of a security or certificate of deposit and market value at the time of their issue	✓				-		
Difference between the paid nominal value of a bond including certificate of deposit or holding deposit, or paid value of employee shares upon their return and market value at the time of their issue	-			✓		-	
Difference between the paid nominal value of a bond including certificate of deposit or holding deposit and rate of issue at the time of their issue			-			✓	
Income from sale of right of first refusal of shares	✓				-		

Type of income	Period						
	1993	1994	1995	1996 - 1997	1998 - 2000	2001 - 2003	2004 - 2010
Income from sale of right of first refusal of securities	-				✓		

From the list above it is clear that during the course of the monitored period, specification and redefinition occurred of individual income categories. This fact is evident for a number of incomes (see for example “Special categories of income” – incomes from sales of right of first refusal of shares were expanded to include right of first refusal of other securities. One may also see that new types of income were also incorporated into Sec 8 ITC. This of course is not the consequence of omission of existing types of income by the legislature, but rather the rise of new legal institutions (ex. controlling contract as an institution of commercial law).

The provisions of Sec 8 ITC also amend the method of taxing the applicable type of income. From this angle, we may identify in principle two basic groups of income. Those taxed in brutto amount (i.e. without the possibility of applying tax expenses) and those for which expenses may be applied (of course only those specified by law). From the aspect of the taxation system of the given type of income, another matter playing a very important role is the question of whether income was earned from sources within the territory of the Czech Republic or from foreign sources. In the case of the first category, it is a general rule that income is subject to so-called withholding tax pursuant to Sec 36 ITC; in the case of the second income category, incomes are generally included as partial tax bases into the total tax base. Table 2 below contains further information, which introduces the concept of determining taxable income pursuant to the legal status valid and effective to October 31, 2010.

Table 2: Determination of partial tax base for incomes pursuant to Sec 8 ITC from sources in the CR and from sources abroad

Provision of Sec 8	Type of income	Amount reducing the income for taxation	Type of taxation	
			source CR	source abroad
Para. (1)	letter a) profit-sharing (dividends) from ownership interest in a corporation, in a limited liability company and a limited partnership, profit-sharing from membership in an association and also interest and other income from holding securities, income from settlement paid to a partner who is not a party to a contract (hereinafter “outside partner”), achieved on the basis of a contract on transfer of profit pursuant to a special legal regulation (hereinafter “profit transfer contract”) or controlling contract pursuant to a special legal regulation (hereinafter “controlling contract)	-	withholding tax pursuant to Sec 36 ITC	partial tax base pursuant to Sec 8 ITC
	letter b) profit-sharing of a silent partner from participation in business, if such profit is not used for replenishing the deposit reduced by shares in losses back up to the original amount	-	withholding tax pursuant to Sec 36 ITC	partial tax base pursuant to Sec 8 ITC
	letter c) interest, winnings and other income from deposits in savings books, interest from funds in a deposit, with the exception of interest and other income from deposits received by the employer from its employees, if the employer is not authorized to receive deposits from the public or from employees pursuant to a special legal regulation	-	withholding tax pursuant to Sec 36 ITC	partial tax base pursuant to Sec 8 ITC
	(see Sec 8 (5) ITC) interest income from bonds issued abroad by a taxpayer with registered seat in the Czech Republic or by the Czech Republic flowing to payers who are tax residents of the CR (natural persons)	-	-	partial tax base pursuant to Sec 8 ITC
	letter d) income from certificates of deposit and holding deposits	-	withholding tax pursuant to Sec 36 ITC	partial tax base pursuant to Sec 8 ITC

Provision of Sec 8	Type of income	Amount reducing the income for taxation	Type of taxation		
			source CR	source abroad	
letter e)	supplemental pension insurance benefits with state contribution	paid contributions and state contributions to supplemental pension insurance	withholding tax pursuant to Sec 36 ITC	partial tax base pursuant to Sec 8 ITC	
letter f)	private life insurance benefits or other income from insurance of persons, which is not indemnification and does not constitute termination of the insurance policy after premium payment reduction	paid insurance premium	withholding tax pursuant to Sec 36 ITC	Until December 31, 2008 - partial tax base pursuant to Sec 8 ITC	
letter g)	interest and other income from provided loans and advances, late payment interest, late charges, interest from the right to call, interest from deposits in current accounts with the exception pursuant to Sec 7(a) and interest from the value of a paid deposit in the agreed amount of shareholders of business companies. Interest from deposits in current accounts, which according to terms and conditions of the bank are not determined for commercial purposes (budget accounts, foreign exchange accounts, etc.) are assessed pursuant to letter c) (Note: the provision of Sec 7(a) ITC amends the so-called tax established by lump-sum amount)	-	partial tax base pursuant to Sec 8 ITC	partial tax base pursuant to Sec 8 ITC	
letter h)	interest and other income from bills of exchange holdings (ex. discount from amount of bill of exchange, interest from bill sum)	-	partial tax base pursuant to Sec 8 ITC	partial tax base pursuant to Sec 8 ITC	
	interest income and other income from holding a bill of exchange issued by a bank for securing a claim arising from a creditor deposit	-	withholding tax pursuant to Sec 36 ITC	partial tax base pursuant to Sec 8 ITC	
Special categories of income					
Para. (2)	letter a)	difference between the paid nominal value of a bond including certificate of deposit or holding deposit and rate of issue at the time of their issue, in the event of premature buy back, the price of the buy back is applied instead of the nominative value	-	withholding tax pursuant to Sec 36 ITC	partial tax base pursuant to Sec 8 ITC
	letter b)	income from sale of right of first refusal of securities	acquisition price of right of first refusal	partial tax base pursuant to Sec 8 ITC	partial tax base pursuant to Sec 8 ITC

For supplemental pension insurance benefits with state contribution (income pursuant to Sec 8(1)(e) ITC), contributions are spread out evenly to a limited period of receiving pension. If the period for receiving a pension is not limited, a medium length of life of the participant is determined based on the mortality tables maintained by the Czech Statistical Office at the time when the person first begins to receive the pension. In terms of income pursuant to Sec 8(2)(b) ITC, an expense in the amount of the acquisition price of the right of first refusal may only be applied up to an amount of earned income (expenses exceeding income are not considered). One may consider as a very important change in the income taxation system the fact that as of 2008, the option was eliminated for a taxpayer to include selected types of income abroad into a separate tax base. A special tax rate existed for this separate tax base, amended by Sec 16(2) ITC. This institution existed in the ITC from 1998 up to and including 2007. The authors discuss in the next chapter the issue of tax optimization in relation to the legal regulations at that time. It contains determined mathematical models.

The following Table 3 contains information on the development of withholding tax for selected types of income. With regard to the taxation method (i.e. withholding tax), this thus concerns incomes earned from sources within the territory of the Czech Republic. The indicated incomes used in the table do not reflect the official labeling of incomes. This nevertheless concerns more general terms under which it is possible over the course of the period to categorize incomes that were labeled variously (but identical in content).

Table 3: Amount of withholding tax for selected types of income

Type of income	Status of taxpayer (receiver of income)	Period		
		1993	1994 - 1999	2000 - 2010
Dividends and ownership interest in limited liability companies and limited partnerships and profit-sharing from membership of an association	resident	25%		15%
	non-resident	25%		15%
Profit-sharing of a silent partner from participation in business	resident	25%		15%
	non-resident	25%		15%
Interest, winnings and other income from deposits in savings books, certificates of deposit and from holding deposits including interest from funds in a deposit account (non-commercial accounts)	resident	15%		
	non-resident	15%		
Insurance benefits in the event of reaching a certain age	resident	x	15%	
	non-resident	x	15%	
Pension insurance benefits	resident	x	15%	
	non-resident	x	15%	

Note: The label "x" means that the listed income category was not contained to December 31 of the applicable taxation period (specifically to December 31, 1993). It is clear from Table 3 that not many changes have occurred in the level of rates of withholding tax pursuant to Sec 36 ITC. Since 2000, it is possible in the case of the listed types of income to mention the unification of withholding tax rates at a rate of 15% (effective January 1, 2008, when the concept of a progressive tax rate was replaced by a linear rate, the rate of 15% equals the general rate for taxation of incomes of natural persons pursuant to Sec 16 ITC). From the performed comparison it is also evident that from the aspect of determining the amount of withholding tax, differentiation was not and is not made between tax residents and tax non-residents, which is certainly the desired state. An opposite status could be considered as being in conflict with international obligations arising among others from agreements on limiting double taxation.

DATA AND METHODOLOGY

Assessment of changes in the area of income taxation by means of withholding tax pursuant to Sec 36 ITC is relatively easy because at this level, the key variable is the withholding tax rate whose development is indicated in Table 3 (see above).

What is more difficult and in terms of the actual assessment probably more interesting is the assessment of legislative development for incomes, which were possible to include into a separate tax base up until December 31, 2007. For selected types of income earned abroad by a tax resident of the Czech Republic, the taxpayer had the option of including them either into his total tax base or taxing the given income separately. In the later case, the income was subject to the rate listed in Sec 16(2) ITC. Table 4 below offers a summary of rates and types of income for which the option was given of selecting the method of taxation (taxation either in an aggregated tax base or within the framework of a separate tax base).

In the following part of the paper, the authors take up the question of suitability of applying the institution of taxing foreign income in a separate tax base. The determined mathematical models and their graphic outputs are founded upon certain starting points and simplifications, which are specified in Table 5. Mathematical models were determined for two versions. The first is the simpler version, which considers income of a tax resident of a nation with which the Czech Republic has not concluded a double taxation agreement (*scenario I*). The second version (*scenario II*) covers the situation where the taxpayer earns an income from a contracting State (understood as a State with which the CR has concluded a double taxation agreement).

Table 4: Income earned abroad capable of being included into a separate tax base

Income category	Period	
	1998 - 1999	2000 - 2007
Profit-sharing (dividends), interest and other emoluments from securities or participation in limited liability companies and limited partnerships and profit-sharing and similar benefits from membership in associations	25%	15%
Profit-sharing of a silent partner from participation in business, if such profit is not used for replenishing the deposit reduced by shares in losses back up to the original amount		
Interest, winnings and other income from deposits in deposits books, interest from funds in a deposit account		
Income from certificates of deposit and holding deposits		
Supplemental pension insurance benefits with state contribution less paid contributions and less the state supplemental pension insurance contribution		
Insurance benefits in the event of reaching a certain age, less the insurance premium paid		
Winnings in lotteries, bets and other similar games and winnings from advertising contests and drawings with established exceptions (ex. if this does not concern tax free income pursuant to Sec 4 ITC)	20%	
Prizes from public contests and sports competitions with the exception of tax free income pursuant to Sec 4 ITC		

As it is seen from this table, also in the case of the tax rate from the separate tax base, only one change occurred – a reduction from 25 % to 15 % for the greater part of income from abroad subject to taxation in a separate tax base. Specification (names) of individual types of income were taken from the legal regulations valid and effective up to December 31, 2008, which basically corresponds in its content to the legal regulations of following years.

Table 5: Simplifications and starting points of determined mathematical models

Starting points and simplifications of mathematical models
<p>Common features of scenarios I and II</p> <ul style="list-style-type: none"> the taxpayer is a tax resident of the CR besides foreign income, the taxpayer also earns income from the CR a tax base is stipulated in the amount of from CZK 180,000,- up to CZK 1,008,000 (i.e. at an exchange rate of CZK 17.75 for 1 USD with a tax base range from USD 10,141 to USD 56,789) foreign income is already included in this tax base the taxpayer is unmarried and has no children (only applies a basic tax free amount from the tax base (up to December 31, 2005) or basic tax discount (as of January 1, 2006, part of the nontaxable parts of the tax base was transformed into tax discounts, whereas this concerned also basic non-taxable part of the taxpayer's tax base), a selected income from abroad is profit-sharing (dividends) the listed foreign income is not tied to a specific country (on the general level a non-contracting and a contracting country is considered under conditions listed hereunder) the effective tax rate is determined as a proportion of the resulting tax obligation pursuant to Sec 16(1) ITC determined according to the relevant wording of ITC (i.e. wording valid and effective to December 31 of the applicable year from the period 1998-2007) and the total tax base. a considered interval change in the amount of the tax base is CZK 12,000 (i.e. at the considered exchange rate of CZK 17.75 for USD 1, this is a change by USD 676) discrete values of the resulting effective tax rate are consequently connected by a flow line, which enables better assessment of trends in development the proportion of foreign income to the total tax base is constant, amounting to 20 % <p>Scenario I</p> <ul style="list-style-type: none"> The impact is not considered of Sec 24(2)(ch), according to which it is possible to include tax paid abroad into tax costs in the taxation period for filing an income tax return, into which the aforesaid income from abroad is included. <p>Scenario II</p> <ul style="list-style-type: none"> For the given type of income, application is considered of the method of an ordinary tax credit (<i>the reason for this is the fact that the listed method is the prevailing method for taxing the category of so-called "passive income" for a number of agreements concluded by the Czech Republic</i>). <i>It is expected that income is taxed abroad by withholding tax in an amount of 15 %.</i>

On the basis of comparing the nominal tax rates pursuant to Sec 16 (1) ITC, the amount of the basic nontaxable part of the tax base on a taxpayer (or discounts on tax per taxpayer) in individual years of the monitored period, it is possible to state an equal amount of the effective tax rate for 1998 and 1999, and then for 2001 to 2005, and lastly for 2006 and 2007. From comparison of the relevant legal regulations in

the years 1999 and 2000 it is clear that the only change that occurred effective from 2000 is removal of the fifth tax bracket of the progressive tax rate (from the amount of the tax base CZK 1,104,000 and higher). For the monitored income interval, we may thus also note agreement of the effective tax rate for 1998 until 2000. As indicated above, mathematical models have been determined for two considered scenarios. The graph below represents the output for *scenario I*, where the consideration was that foreign income was earned in a non-contracting country.

Figure 1: Comparison of the effective tax rate and the tax rate from the separate tax base (*scenario I*)

A criterion for considering use of the institution of taxation of foreign income in a separate tax base was comparison of the effective tax rate from the total tax base with the rate valid for income taxation in a separate tax base. In the event that the second mentioned rate was lower, from the aspect of optimizing the total tax burden, it was advisable to consider subjecting foreign income to taxation in a separate tax base. In 1998 and 1999, the rate for taxation in a separate tax base was 25 %. In these years, the effective tax rate from the total tax base achieved this amount roughly for an annual tax base in an amount of CZK 696,000. From 2000 to 2007, the rate for taxation in a separate tax base was 15 %. These facts contributed in fundamental measure to the decrease in the value of the tax base, where the effective tax rate from the total tax base equaled the tax rate from the separate tax base. In 2000 this roughly equaled an amount of CZK 240,000, CZK 252,000 in 2001-2005 and CZK 288,000 in 2006-2007.

In *scenario II*, the situation is considered where foreign income is earned from a contracting state and in relation to this, the method of an ordinary tax credit is applied (this concerns one of the basic methods of limiting double taxation).

Figure 2: Comparison of effective tax rate and tax rate from a separate tax rate (*scenario II*)

If we consider *scenario II*, also playing a role is the influence of the factor of a tax credit paid abroad. From the aspect of the taxpayer, this positively influenced the resulting effective tax rate. For 1998 to 1999, there was no meaning for assessing the income interval in considering application of taxation of foreign income in a separate tax base (by which, aside from others, the option of a tax credit paid abroad to the total resulting tax liability would fall away). For 2000, the effective tax rate from the aggregated tax base equaled the tax base for the independent tax base for a tax base in the amount of CZK 348,000. For 2001-2005, the amount of this tax base then equaled CZK 372,000. The latter amount was also applied for 2006 and 2007.

CONCLUSION

This paper deals with the issue of the development of legal regulations governing capital income taxation of natural persons in the Czech legal system. The monitored period was from 1993 up to and including 2010. For 1993-2009, the legal status was taken into consideration that was valid and effective to December 31 of the given year; for the tax period of 2010 the status was taken into consideration that was valid and effective to October 31, 2010. The authors focused on comparing relevant provisions of the ITC. This primarily concerned defining incomes falling into the category of capital income and the method of determining the tax base for capital income achieved by non-residents from sources within the territory of the CR and capital incomes achieved by residents from sources abroad. Furthermore, a comparison of rates of withholding tax and its development in time was performed for selected types of income.

In terms of the number of incomes included into Sec 8 ITC, one may state that over the course of the monitored period, specifying and redefining of individual categories of income occurred. It is also necessary to state that new types of income were also included, which may be accredited to the existence of new legal institutions in the Czech legal system (ex. controlling contract (*institute of commercial law*)). If we concern ourselves with assessing withholding tax rates, these saw only one major change during the monitored period, which was replacement of the 25% rate with a 15% rate.

In relation to the method of establishing the income for taxation, it is possible to note the relative stability in legal regulations. However, what was an important change was certainly the existence of the option of taxing selected incomes achieved abroad in a separate tax base. The option was provided of taxing the selected types of income in the separate base by legislative amendment in 1998-2007. This legal institute is very interesting in terms of assessing the development of legal regulations, so the authors focused keenly on this aspect. Mathematical models were determined for two considered variations, comparing the effective tax rate from the aggregated tax base with the tax rate for the separate tax base. The first of them (*scenario I*) was the situation where foreign income was earned from a non-contracting state, and the second (*scenario II*) was where foreign income was earned in a contracting state. Regarding the entire spectrum of options offered in this aspect, the authors were compelled to affiliate certain simplifications that they specified prior to the presentation of experiential results.

The independent variable was the sum of the aggregated tax base from natural person income tax, and the dependent variable was the effective tax rate. From the performed comparison of this rate with that which was determined for taxing foreign income within the framework of the separate tax rate, the authors identified the amount of incomes for which the listed rates are equal to one another. This data was important from the aspect of considerations on use of taxation of foreign income within the framework of a separate tax base. From the aspect of assessment, a specific period was the period of 1998-1999, when the tax rate from the separate tax base amounted to 25 %. This led to the fact that the benefit of taxing foreign income in the separate tax base was only achieved upon attaining a very high tax base. For the period 2000-2007, it is necessary to point out the influence of gradual reduction of the effective tax rate from the aggregated tax base, and the drop in the introduced rate from 25 % to 15 %. Mainly the second fact contributed significantly to the fact that the level of the tax base decreased dramatically, where the effective tax rate and tax rate from the separate tax base are equal to one another. Nevertheless, during the period 2000-2007, in regards to the declining effective tax rate, one may also note the declining benefit of taxing foreign income in a separate tax base. However, this assessment is somewhat simplifying because it does not consider the question of development of the growth in nominal incomes of taxpayers over time. The determined mathematical models also proved the partial benefit of double taxation agreements. In *scenario II*, where application of the ordinary credit method was presumed, the application of the stated method for limiting double taxation led to a reduction in the effective tax rate.

The experiential results must however be understood within the context of simplification, to which the authors inclined, and in the context of defined starting points. One of the fundamental starting points utilized by the authors is the choice of the model category of the taxpayer (regarding an unmarried taxpayer with no children). The analysis performed would understandably be possible to expand to include further categories of taxpayers (for example, a married taxpayer with a child/children); in like fashion it would be possible to widen the spectrum of the considered tax base. Regarding this last fact, it would then be possible to assess the impact of implemented changes on the taxpayers in various income brackets. In relation to the achieved results, it is vital to still point out the fact that determining the amount of income, where equaling occurs between the effective tax rate from the aggregated tax base and the rate for taxation of the independent tax base, is solely for orientation purposes. Other factors were of course at play in terms of considerations for optimizing the tax burden.

Within the context of the matter at hand, ample room is found for performing comparisons of Czech legal regulations with those of other countries. In this regard, it could be somewhat problematic that the category of *capital income* is defined differently in individual countries. This could lead to the situation where, when lacking knowledge of the actual content of *capital income* in individual countries, comparison would be performed inaccurately.

ARE THE DOWNSIDE HIGHER ORDER CO-MOMENTS PRICED? : EVIDENCE FROM THE FRENCH MARKET

Houda Hafsa, University Paul Cézanne Aix-Marseille3 & University 7 Novembre Carthage

Dorra Hmaied, University 7 Novembre Carthage

ABSTRACT

This study examines the role of higher order downside co-moments in asset pricing model when stock returns are not normal. We test the effect of higher order downside co-moments using regressions on a data set of daily mean returns of the SBF 250 stocks during the period 1987-2009. Results suggest that downside Beta and the higher order co-moments in the downside framework should be considered together when the returns are non normal and that they perform the traditional beta.

JEL: G12, G15, C21

KEYWORDS: downside Beta, downside higher order co-moments, CAPM, French market.

RESUME

In this study, we introduce in the CAPM downside beta, downside co-skewness and downside co-kurtosis to explain stock returns on the French market. We used the three well known measures of risk in a downside framework (Hogan and Warren, 1974; Harlow and Rao, 1989; and Estrada, 2002). In a first analysis we regressed the average stock returns on the risk measures over several models. Consistent with previous studies, we find that the CAPM fails to explain the cross sectional variation in the observed returns. The empirical results also provide strong evidence to consider the three downside co-moments to explain cross-sectional stock returns in the French market and reveal that they are complementary risk measures. Another ambiguous result comes out from this study is that the premium associated to downside co-moments have signs opposite to what expected. We argue that this result could be explained by the fact that the market is not sufficiently mature to reveal the anticipated direction of risk-return relationship.

To investigate the sensitivity of our results to the methodology used, we repeated the study using the two pass methodology of Fama-MacBeth instead of the one used in first analysis. The results provide further evidence to consider jointly the downside co-skewness and the downside co-kurtosis in pricing models. Nevertheless we cannot really say that their role is sufficient in explaining economically and statistically the cross sectional mean return in the French market.

Finally we examined the effect of recession market periods on the results. We find that none of the considered measures of risk is priced when we exclude the downturns period that affected the French market. This result confirms the one of Post and Vliet (2004) indicating that there is a near-perfect relation between returns and downside risk measure (downside beta) during bad-states of the world. We find also that the results seem to depend to some extent on the degree of the departure from normality. Although a theoretical base and an economic and financial interpretation are in somewhat lacking, this study provides further evidence on to the debate on whether systematic higher order co-moments are able to explain cross sectional security returns particularly in a downside framework for the French market that it was not investigated previously. Our study presents a limit as it considers only a small sample of securities and stronger evidence may be found with larger sample.

CHOOSING FINANCIAL KEY PERFORMANCE INDICATORS: THE AIRLINE INDUSTRY CASE

Ganna Demydyuk, Lorange Institute, Zurich

ABSTRACT

Selecting relevant Key Performance Indicators (KPIs) involves an assessment of both cost- and revenue-driven measures. Cost driven allocation usually predominates, due primarily to a traditional accounting mindset coupled with the need for cost savings in the current economic environment. Using data from the airline industry in all of the major markets in the world, this paper demonstrates that revenue- or profit-driven KPIs, consistently applied, will likely lead to better financial performance than 'flying' the business based on cost-driven metrics or those, representing a mixture of revenue target and cost-driven metric. Specifically it examines the effectiveness of models that characterize performance based on two performance indicators, in particular – seats and passenger-kilometers. We document strong evidence indicating that Operating Profit per Passenger or per Passenger-Kilometer is the most significant variable when it comes to explaining the variation in airline profitability. Our conclusion is that despite the traditional belief that measuring per seat is only appropriate for point-to-point destination services, typically provided by Low Cost Carriers, the same model also fit Full Service Network Carriers and, thus, can be used by them as a meaningful tool for financial targeting and strategic decision-making.

INTRODUCTION

Despite airline industry growth over decades, the majority of airline businesses remain consistently unprofitable over an entire business cycle. This paper is an empirical study that attempts to distinguish between cost driven and revenue driving financial performance indicators that may better help us predicate airline's financial performance. Our main assumption underlines the effect of using two different KPI's models. We examine the effectiveness of models characterizing performance based on two activity drivers – seats or passengers (revenue driving) and passenger-kilometers (cost driven). It has been traditionally considered that measuring by seats is only appropriate for point-to-point destination services, typically provided by Low Cost Carriers and should not be used by legacy airlines.

Certainly, achieving a successful airline consists of a great number of aspects. Thousands of activities towards revenue increase or cost reduction are simultaneously taking place in airline business, but whatever is done it results in the black or red bottom line in the Profit and Loss Statement. The 2008 results (IATA Economics, 2010) showed that there is no evidence of a straightforward correlation between size and absolute profit, confirming results from earlier years. In 2008, operating profitability was extremely weak across all regions. Some Low Cost Carriers, previously generating +10% margins, saw weaker performance, demonstrating that the economic environment challenged all business models.

Our key findings indicate that model based on kilometers fits the industry slightly better than the one based on passengers (seats). Furthermore, we find strong evidence indicating that Operating Profit per Passenger or per Passenger-Kilometer is the most significant variable explaining airline profitability. In spite of classical beliefs, we found it is more meaningful than revenue, cost and load factor traditionally used by the industry. We also found that relationship between profit margin and seats-based model is strong enough for both classes – LCCs and Full Service network carriers. Therefore, we arrive at the conclusion that Operating Profit per Seat can be successfully used for targeting the financial performance of Full Service Network Carriers.

INDUSTRY APPLICATION

Working with variables relating to cost and revenue generation one would require data overlooking long-term financial perspective down to product and customer level details. Airlines data provided a solution when we were able to collect operational statistics (number of passengers, number of kilometers offered/flown, employees, aircrafts, etc.) from open sources, as for each specific company so for the industry. The data used for the analysis has been taken from published annual reports of commercial airlines over recent 5 years, containing also the main financial statements. The classification of airlines in this paper will follow a model used by the Research Unit of German Aerospace Institute (DLR), thus, we distinguished airline companies by those of (abbreviation in brackets):

- Full Service Network Carriers (“FSNCs”)
- Low Cost Carriers (“LCCs”)
- Regional Carriers (“Regionals”)
- Holiday / Charter Carriers (“Charters”)

Full Service Network Carriers are scheduled airlines with a business model that focuses on providing a diverse and extensive service. These are typically international operating companies with a network-oriented system (normally with one or more hubs), covering a wide geographical area and providing transportation in several different classes. The Low Cost Carriers category comprises those airlines that offer low prices for the majority of flights and which mainly operate on short and medium-distance routes with low overheads and a relatively high load factor; these airlines use a no-frills business model. We will not work with Regionals or Charters, because their market influence is insufficient. For example in the year 2008, FSNCs supplied 58% of weekly seats available at European airports, followed by LCCs offering 34.1% of total capacity. Charter carriers and Regionals had respective shares of only 4.7% and 3.2%. On average, the top 40 airlines cover almost the whole market: in 2008 - 40 top FSNCs – 91.1% and 40 top LCCs - 99.8% respectively. (DLR, Annual Report 2007, 2008)

LITERATURE REVIEW

According to Doganis (1985), the profitability of an airline depends on the interplay of three variables, the unit costs, the unit revenues or yields and the load factors achieved. Airline managers must adjust costs, fares and load factors to produce profitable combinations. He characterizes the industry by short-run marginal costs, which are close to zero. Marginal cost of carrying an extra passenger on a flight, which is due to leave with empty seats, is no more than a cost of additional meal, an airport passenger charge, the cost of ground handling and a few pounds of fuel burnt as a result of extra weight. The run of these costs is short, because if the seats remain unsold, these seats flown or seat-kilometers produced will be lost forever. Therefore, he suggests maximizing revenues and load factors.

For passenger airlines, the average revenue per output sold is called Yield and measures average revenue per passenger, per passenger kilometer, per passenger tone kilometer performed. Thus, he reasons the existence of low cost carriers, stating that by combining passenger yields with low cost and relatively high load factors one can achieve profitability. He also demonstrates that low cost itself does not provide big margins interacting with low revenues, nor does high cost necessarily mean low profits if the revenues are high enough. Doganis concludes that airlines deciding on their pricing strategy, and working out various tariffs, must balance and assess all these factors, which transform the various fares into average yield. He states that it is the yield in conjunction with the achieved load factor and the unit costs, which will determine whether an airline's revenue and financial targets can be met. To assure such process airlines apply revenue management process, underlying revenue management systems. The objective in revenue management is to maximize profits; however, in most situations, it is considered sufficient to

seek booking policies that maximize revenues. (McGill and Van Ryzin, 1999) Thus, revenue management focuses on revenue achievement without direct link between profit and revenue in a single system. Traditionally, planned or targeted revenue calculated to cover costs and achieve profit; the latter applies as a further layer of percentage. Calculation of projected revenue usually involves traditional accounting concepts, which focus mainly on cost allocation and therefore based on cost driving metrics (kilometers, more kilometers flown generate greater costs). In the area of accounting concepts, Cleland (1998) suggested an approach to management decision-making for improved bottom-line performance 'Contribution Based Activity' or CBA. It does not directly relate to transport industry, but to business in general.

The CBA approach suggests a performance management system (including pricing and productivity), not denying cost or revenue management, but complementing them. We reviewing this approach, because it links financials (profit = revenue - costs) and operational metrics (units of output) and simplifies the process of comparing planned with actual gross profit per unit. As this method involves revenue, costs and activity, it allows management to overview the whole picture in a timely and relevant manner. CBA method critically demands proper definition of an output measure, called activity driver, and considers it being fundamental to all other activities, in other words it suggests working with profit driving indicators. We did not find studies, which extended into profit per unit of output, and answering what is a right output measure? Summarizing the above, we arrive with two potential models of performance measurement. The one consists of commonly used metrics described by Doganis, focuses on revenue achievement and bases on cost driven measures such as kilometers. Another model consists of revenue driving indicators such as seats (more seats filled with passengers increase revenue). Following the Cleland's idea, we unite seats with focus on Profit instead of Revenue in order to incorporate costs in the suggested model.

VARIABLES

From airlines annual reports and from literature on airline economics, we conclude that main operational measurements are as follows (definitions according to R. Doganis "Economics of international airlines"):

- **ASKs** – available seat kilometers *obtained by multiplying the number of seats available for sale on each flight by the stage distance flown (sometimes miles, then referred as ASM)*
- **RPKs** – revenue passenger kilometers or passenger kilometers *obtained by multiplying the number of fare-paying passengers on each flight stage by flight stage distance. They are measures of airline passenger traffic.*
- **Load factor** (percent) or **Passenger load factor** *is passenger kilometers RPK expressed as a percentage of available seat kilometers ASK. Load factor considered being one of the most important indicators of airline operations and for certain airlines; it remains the main management focus.*
- **Number of Passengers** or **Passengers carried (PAX)** *equals the number of passengers, which boarded each aircraft and summed over a certain period.*
- **Yield** *is the average revenue collected per passenger kilometer or RPK. Passenger Yield is calculated by dividing the total passenger revenue on a flight by the passenger kilometers generated by that flight. It is a measure of the weighted average fare paid. It is considered that airlines should focus on Yield increase.*
- **Cost per ASK** *a measure obtained by dividing total operating costs by total ASKs. Operating costs exclude interest payments, taxes and extraordinary items. Costs could also be measured by RPK, but measuring costs by ASK is more relevant and therefore very common.*

While FSNCs rely traditionally on cost driven metrics, calculating everything per kilometer, LCCs often use revenue or profit driving indicators such as per seat or per passenger metrics. The following 'per seat measures' were used for reporting by European LCC easyJet (easyJet full year results 2009):

Per seat measures (underlying)
 Profit before tax per seat (£)
 Revenue per seat (£)
 Cost per seat (£)

Cost per seat excluding fuel (£)

This is more typical for LCCs as they mostly sell one-way single restricted fares. FSNCs in contrast sell far more complex product, and therefore consider the kilometer version being more appropriate.

DATA AND METHODOLOGY

For our analysis we focused on 20 top airlines in each class (FSNC and LCC), accessing financial data for 5 years (2004-2008). Our sample includes 15 top FSNCs and 12 LCCs, reflecting worldwide geography. We did not manage to get data for all 40 companies because some of them are not publically traded and so do not publish reports while others are unavailable because of recent mergers and organizational changes. The data in the form of annual financial statements, annual filings and business reports were transferred into US dollars and processed into a consistent basis, and was clustered by three criteria:

- Business model (FSNC or LCC)
- Region of origin and operations (Europe, Americas, Asia-Pacific and Middle East)
- Financial performance (High or Low)

Due to a slight inconsistency in data regarding the load factor, reported by airlines, we calculated load factor ourselves to assure this ratio is consistent. It is not clear from the reports whether they use passenger load factor or seat load factor, which counts not only fare-paying passengers, or includes also crew travelling to the point of their future destination.

Revenue management is certainly about pricing, but profit normally takes costs into account. In order to involve both participants in the profit process – **revenue and costs** – we suggest planning and targeting **profit** instead of revenue and costs, combined with planned load factor. Should we apply CBA approach and use the Gross Profit (sales minus cost of materials), GP would tend to Revenue, as direct material costs here are only marginal. Therefore in this case **Operating Profit** is the most informative and consistent variable to express financial contribution produced by the key activity. We distinguish Operating Profit from Net Profit because the latter already contains extraordinary items, government grants, write offs and the like. Nevertheless, net profit is still an important indicator and it is incorporated in further used ratio Return on Assets ROA percentage. Key metrics mainly represent ratios, which consist of numerator and denominator. Numerator indicates a targeted value and Denominator indicates a measure, in this case a measure of output. Instead of revenue, we suggest expressing targets as financial contribution, made by activity driver or output (seats sold or revenue passenger kilometers):

Target: Operating Profit per output rather than Revenue per output

Now we can distinguish between cost and revenue driving metrics and aim to compare effectiveness of two existing models to airline performance measurement per seat and per passenger kilometer. As we are measuring output, we are going to work with most commonly used metrics such as Seats sold and Revenue Passenger Kilometers (RPK). For the purpose of this research, we identify seats sold with passengers carried, primarily because any existing difference between the two is insignificant and in any case, it is not possible to access the data from most company reports. Therefore, we used the number of passengers carried in both – data collection and empirical testing. Thus, the second suggestion relates to output:

Output: Target per Passenger carried rather than Target per RPK

These both suggestions specifically result in the following ratios, further used in the empirical testing:

- Operating Profit per passenger carried
- Revenue per passenger carried

- Operating cost per passenger carried
(Operating costs, excluding interest expenses, taxes, extraordinary items and other non-operating expenses)

Further, we develop models involving above ratios, including traditional KPI's as well. The goal of this analysis is to establish whether there is a measurable significance in profitable performance between focusing on Operating Profit per passenger or per RPK (passenger-kilometer) instead of Revenue. This suggested model compared with traditional models, consisting of revenue, load factor and RPKs.

SAMPLE CHARACTERISTICS, DESCRIPTIVE STATISTIC AND CORRELATIONS

The sample includes 5 years data (2004-2008) for 27 companies, i.e. 135 cuts on annual basis. Analysis overlooks all variables and ratios used in both, Kilometers and Passenger modes, and present such data as Minimum, Maximum, Standard Deviation, Skewness and Kurtosis. As sample data is very diverse, due to difference in scope, region and business model, total sample was clustered accordingly (Region, Model, Performance). We ran the correlation analysis for both models and three data clusters. Analysis of separate clusters uncovered interesting facts about the airline business in different classes and continents, relevant to cost-driven and revenue driving metrics. Findings summary follows below.

Region Of Origin And Operations (Asia & Pacific And Rest Of The World, Europe, Americas).

The analysis on a regional basis contains 40 annual cuts for Asia & Pacific and rest of the world, 35 annual cuts for Europe and 60 annual cuts for Americas. Despite the similarity in Operating margin percentage for Asia and Europe (6.9% and 6.1%), Asia demonstrates the greatest Operating profit per passenger absolute, probably because of longer overall average length of passenger haul and lack of competition, attributable to this region. Through the eyes of profit drivers, it means that carrying fewer passengers requires higher profit per passenger in order to cover costs and earn profit. The highest margins achieved by Asian companies and the lowest belong to American, with Europe in between. Interesting here is a similar passenger revenues of \$179.5 in Europe and \$172.9 in Americas with noticeable difference in Operating profit per passenger (\$7.7 and \$(-0.2) respectively) and an average Operating margin of 6% and 2%. The bulk of our sample belongs to American companies (in most part big FSNCs and unprofitable), which means the American national carriers dominate the sample.

In Europe, there is a negative correlation between Load Factor and Revenue per Seat with the coefficient -0.411. In addition, there is a negative correlation of -0.390 between Number of Passengers carried and Operating Profit per seat. Unlike Asia and America, in Europe Revenue and Profit drop while the Load Factor and Number of Passengers increase. This speaks for the competitiveness of European Market and represents a well-functioning market, when passengers pay enough to cover costs and earn profit that allows decrease prices in order to handle competition. Such trend is not the case for Asia and America.

Business model (FSNC versus LCC):. Results of this analysis confront common opinion that LCCs fly with very cheap fares and high loads, so they have a significant advantage when compared with FSNCs, operating with high costs and less flexibility. There is no big difference in average load factors, nor in mean values or in the extremes. With the nearly identical mean of 77.3% for FSNCs and 77.9% for LCCs, the minimal value of 64.9% for FSNCs, which is even higher than 61.6% belonged to LCCs; however with the maximal load factor of 85.6% LCCs overcame FSNC's 82.7%. In spite of the range in passenger revenues (\$308.4 versus \$105.3), which we rather predicted, operating profit per passenger – the value we are focusing on – is nearly identical and differs by only 9% (FSNCs \$8.5, LCCs \$7.7).

For FSNCs there is a strong negative correlation between the number of passengers carried and Operating Profit per passenger as well as Operating Margin (Correlation coefficients -0.481 and -0.452 accordingly). In contrast, for LCCs correlations between the number of passengers and Operating profit per passenger

as well as Operating profit percentage are insufficient, in other words for LCCs poor or high financial performance doesn't depend on company's scope of operations. This anomaly about profit decrease with increase of the number of passengers can be explained that US companies dominate FSNCs sample, moreover, negative correlation between Load Factor and Operating Profit percentage (-0.259) is given for American companies only. In other words, in spite of high loads up to 85%, American companies did not manage to achieve operating profitability (decrease costs or increase revenues) unlike their Asian and European colleagues. Taking a closer look at operating profit per passenger in America, we can see the mean -\$0.2 compared with \$7.7 in Europe and \$8.1 industry average.

We found Load Factor being an important variable for LCCs profitability measured by Operating margin and, ROA. In contrast, there is no strong correlation of Load factor to profit for FSNC's. However, Revenue per seat is important for FSNC's profitability, but not that important for LCCs to achieve their financial targets. In other words, Low Cost carriers can afford decreasing prices for competition purposes. We can say that LCCs with their thin margins and focus on earnings per passenger must watch their Load Factors, attracting more customers for the same number of flights. In other words, in order to manage the profit they must manage the key activity, and attract a sufficient number of passengers. Number of passengers is a key leverage for LCCs in conjunction with operating profit per passenger.

FSNCs in turn appear have greater stability in number of passengers, and any efforts to increase their number or Load factor will not pay back if the revenue per passenger results in an inadequate operating profit. If every passenger brings a negative profit (because of insufficient revenue), multiplied by tenths of millions of passengers their business results then in financial disaster. We can reasonably conclude that for FSNCs key leverage is Revenue per passenger or Operating profit per passenger in conjunction with passenger numbers. Finally, Beta negatively correlated with size (RPK) of FSNCs and indicated higher risk for bigger companies. For LCCs, however, lower costs and higher profits decrease the risk expressed in Beta.

Financial performance (High performers versus Low performers: We sorted the data according to Operational margin percentage. At the mean value of 0.045 or 4.5% we separated the data under +0.045 and over +0.045. The result was 67 low performing annual cuts and 68 high performing annual cuts. Interesting to note the difference in mean Operating margin percentage and operating profit per passenger from -1.7% to 10.8% and -\$4.3 to +\$20.4, while revenue per passenger fluctuated only within \$206.2 and \$230. Moreover, the smallest passenger revenue of \$42.8 belonged to high performers, when at the same time, lowest average revenue for low performers achieved \$63.9. Yields did not differ dramatically, but the highest Yield still found among Low performers. Same about load factors, which average was between 76.6% and 78.5%. The, highest load factor of 85.6% was found among the low performers again. Operating costs per passenger for low performers were even \$0.5 lower than for high performers i.e. \$210.8 and \$211.3 respectively. Let us summarize.

Judging according to traditional KPI's model, Low Performers appear to have out-performed High Performers, whereas in reality, they underperformed financially. In contrast, according to the passenger model, High performers, supported by higher operation margins, did better than Low performers.

Financial performance of 27 companies studied out of 40 top global carriers, did not depend on business model applied, or on the region of operation, nor on their size. They flew with average load factor about 77.6%, charging on average \$218 and earning in average \$8 per passenger. Traditional business drivers, such as Yield, Load factor, Air fare and costs did not appear to drive successful financial performance.

MODELING KPI'S USING REGRESSION ANALYSIS

For the regression analysis, we suggest the existence of two KPIs models. First model traditionally suggests focusing on revenue increase (Yield) per item of cost-driver (kilometer) to achieve financial targets. In this model management supposed to focus on increase of revenue and load factor as well as cost reduction. We will mention it further as Kilometers model. Second model suggests focusing on operational profit achievement, which expressed as a multiple of number of passengers carried and operating profit per passenger. In this case, Operating Profit already incorporates Revenue and Cost, while Number of Passengers carried arrives from the relation between number of available seats and Load Factor. This model we name as Passenger model. In both models, β -coefficients shown that either "Operating profit per passenger" or "Operating profit per RPK" found to be the best predictor of firm performance. Operating Profit per Output appears to represent a powerful driver for firm success.

According to data clustering, there are 12 models for each performance measure. We checked all the participating variables for multicollinearity and excluded variables strongly correlating with the dependent variable. The dependent variables were the performance measures such as Operating margin percentage and Return on Assets (ROA) percentage. The aim of analysis is to answer a question "Is *measuring Operating Profit per Passenger* is a better model than *measuring Yield (Revenue per RPK)* or *Operating Profit per RPKs* for predicting airline profitability?" Out of 24 models, we selected those, with the highest R squared and summarized in Table 1 (Operating Profit) and Table 2 (ROA).

Table 1: Model Summary and Coefficients. Dependent variable Operating margin %

Model		Standardized Coefficients	t	Adjusted R Square
		Beta		
Kilometers Model TOTAL sample	(Constant)		3.468	.833
	RPK million	-.087	-2.329

	Revenue per seat sold	.138	2.508	
	Operating profit per passenger	.902	16.890	
Kilometers Model Low Performers	(Constant)		-.435	.880
	Operating Profit per RPK	.939	22.001	
	(Constant)		2.300	.858
Passenger model FSNC	Number of passengers	-.093	-1.630	
	Revenue per seat sold	-.170	-3.001	
	Operating profit per passenger	.958	18.438	
Kilometers Model FSNC	(Constant)		.941	.918
	Load Factor	-.031	-.926	
	Operating Profit per RPK	.958	28.726	
Passenger model LCC	(Constant)		6.323	.729
	Revenue per seat sold	-.392	-5.508	
	Operating profit per passenger	.896	12.571	
Kilometers Model LCC	(Constant)		-3.923	.783
	Operating Profit per RPK	.491	4.734	
	Rev. ASK/cost ASK	.443	4.276	

This table summarizes regression analysis with the dependent variable Operating Profit percentage. It contains models with highest R squared out of 24, and shows that kilometers model involving Operating profit per RPK and number of RPK fits the industry better than the passenger model, involving Operating Profit per Passenger.

Judging by the higher R-squared and in comparison with ROA the Operating Margin model found to be a better model explaining variation in the performance of airlines. Out of the analysis, Operating Profit per output sold (RPK or Passenger) is the dominant variable in explaining firm performance. However, in the cases of ROA models, we can see more clearly potential impact of size as reflected by the "Number of

Passengers” variable. In the ROA models, number of passengers and Yield appear in a number of instances as important variables. As well as in above described correlations, in most cases the number of passengers variable has a negative relation to performance, suggesting that smaller airlines are more likely to be profitable than larger airlines. Indeed, it is generally easier to stay focused in a small company rather than in large one. However, it is not the case in our example – as we already explained in our sample - the biggest carriers originate from America and they are mostly unprofitable, while several times smaller carriers from other regions are more successful.

The regression analysis shown that kilometers model involving Operating profit per RPK and number of RPK fits the industry better than the passenger model, involving Operating Profit per passenger. This conclusion based on regression coefficients in both – Operating Margin and ROA models. Tables do not contain data on Passenger model for Full sample, because key coefficients were insufficient comparing with other models. One of possible explanations why RPK might predict firm’s performance better is that unlike number of passengers, RPK not only incorporates load factor, but also contains such important numbers as average haul length, aircrafts number/size, and other important numbers and thus, characterize the industry better. Another explanation is still there – American companies are the biggest, FSNCs, Low Performers and they dominate the sample. This can be valid if see the better fit of Kilometers model for Low Performers and FSNCs as well.

Table 2: Model Summary and Coefficients. Dependent variable ROA %

	YIELD, cents €	.093	.712	

This table summarizes regression coefficients for models, with the highest R squared out of 24 models. Judging by the higher R-squared and in comparison with ROA the Operating Margin model found to be a better model explaining variation in the performance of airlines

When comparing high versus low performing carriers for both dependent variables, we surprisingly better able to explain performance of low performing airlines than the high performing ones. For both models, we observe a much lower R-squared for the high performing airlines than the regressions with low performing ones. A possible explanation for this result might be that for the large, traditional and likely unprofitable airlines, use traditional financial performance metrics focusing on Yield, Kilometers and Load Factor might be all what they are guided by. Again, large and unprofitable airlines originate mainly from America and successful European carriers (both FSNC and LCC) are of smaller size. In our sample, most large, traditional airlines appeared to be low performers and therefore traditional airlines performance model should explain their behavior better than the relatively fewer high performers, which probably are more creative and expand traditional airline performance models with better KPIs.

The Operating Margins models appeared better able to describe performance of Full service carriers than low cost carriers did. (Compare the R-squared of 0.918 and 0.858 with 0.783 and 0.729). Closer look at Operating Profit table shows that Kilometers model better fits FSNC sample while Passenger model better explains performance of LCCs, which was rather expected. According to theorists, 'per passenger' models attributable for single leg 'Origin-Destination' routes, this is normally the case for LCCs and not the case for FSNCs. However, what we can also see from analysis for FSNCs in Operating Profit Table, that Operating profit per Passenger and Operating profit per RPK got same Beta of 0.958 and different but high enough t (18,438 and 28,726 accordingly). In other words, Kilometers model with Operating Profit per RPK better fits FSNCs, whereas Passenger model with Operating profit per Passenger fits both airlines classes – LCCs as well as FSNC. Judging from the Adjusted R Square, passenger model fits FSNCs sample (0.858) even better that it does LCCs (0.729), despite the traditional view that passenger model can be used only by LCCs providing single point to point destination services.

CONCLUSIONS, OBSERVATIONS AND RECOMMENDATIONS

This paper is an empirical study that attempts to identify a reasonable model that may better help us predicate airline financial performance. In doing so we looked at the most commonly used metrics in the airline industry, specifically we examined the effectiveness of models that characterizes performance based on two activity drivers – passengers and kilometers, passengers based indicators represent revenue driving ones and kilometers based – cost driven. Our main results indicate that the kilometers model fits the industry slightly better than the passenger model, however we discovered that passenger model can be applied to FSNCs despite the traditional view that it is appropriate mainly for LCCs. Furthermore, we find strong evidence indicating that Operating Profit per Passenger or per Passenger-Kilometer is the most significant variable predicting airline profitability. It found to be more important than revenue, unit cost and load factor traditionally used by the industry. In our analysis, we did not find any significant correlation between size, business model or region, which would explain low or high profitability of an airline.

In our analysis, we did not find that Seats is a better denominator as Passenger-kilometers. Certain correlation indexes between Profitability measures and Operating Profit per Passenger were higher than between Profit and Operating Profit per RPK. In turn, the regression analysis shown that Operating Profit per passenger-kilometer fits the industry better. Judging from the Adjusted R Square, passenger model fits FSNCs sample (0.858) even better that it does LCCs (0.729), despite the traditional view that passenger model can be used only by LCCs providing single point to point destination services. What we also found out of the regression analysis is that Operating Profit per Passenger is almost as good as Operating Profit per RPK. In light of the above, this should be the most important finding.

Out of all the variables used for the analysis, we defined Operating Profit per RPK or per Passenger as the most important variable. Even though there was a significant correlation between Revenue per seat and profitability of FSNCs, it was the fact for this business model only. At the same time for the same class, Operating Profit per seat and per RPK not found to be less important than Revenue. Indeed, the

importance of sufficient Revenue per passenger shows that company should price the airfares and target ancillaries in a way that permits covering cost and achieving planned profitability. Analysis of all the clusters, including FCNC, shown the importance of Operating profit per output (Passengers or Kilometers) and have not shown the importance of Revenue for operating and financial profitability. This finding is supported also by fact that in spite of the range in passenger revenues (FSNCs \$308.4 versus LCCs \$105.3) operating profit per passenger – the value we were focusing on – was nearly identical and differs by only 9% (FSNCs \$8.5 versus LCCs \$7.7).

Table 3: Comparison of key financial data for two European air carriers, Ryanair and Lufthansa

	Ryanair	Lufthansa*
Region of operations	Europe	Europe
Business model	LCC	FSNC
Passenger Revenue, m. EUR	2,714	18,393
Total Costs, m. EUR	2,177	17,671
Operating Profit, m. EUR	537	261
Passengers Carried, m. EUR	50.931	70.543
Number of passenger aircrafts	163	494
Average revenue per passenger	EUR 53.3	EUR 260.7
Average passenger fare	EUR 43.7	EUR 238.9
Operating Profit / passenger	EUR 10.6	EUR 10.2

*This table contains selected key data for two very different airline companies, which in terms of profitability are very successful and are the 1st and 2nd large European carriers in their segments. The first part of this table highlights the difference in scope of these two businesses. However, when it comes to operating profit per passenger, the figures are surprisingly equal. *Lufthansa Group, passenger segment*

Table 3 compares data of two European airlines, different in scope and business model, but similar in their targets. This comparison demonstrates how we can define the key driving activity and drill into the heart of the business, deriving KPI's which pinpoint and focus on the business goal achievement. If we liken the airline business to a machine driven by passengers, we find the operating profit from one turn of a small machine equals the operating profit from one turn of a big machine. Traditionally airlines consider that the machine driven by kilometers, but some tend to view the machine as driven by passengers. We believe this difference is an important part of the success secret applicable to business in general.

The outlook of the financial statements of all 27 companies demonstrated rather stable relationship between Profit and KPI's. While the majority of companies achieved consistent gradual increase in Yields, RPKs and Load Factors, only few of them improved profitability. Most of high performing companies demonstrated consistency in focusing on profit according to interplay of Operating profit per Passenger and Number of passengers. In other words, by increasing its Total Operating Profit, a company can increase Operating profit per Passenger or Number of Passengers (Flights) or increase both.

Table 4. Financial KPIs for selected high performing airlines

	Variable	2004	2005	2006	2007	2008
British Airways	Operating profit per passenger	15,12	21,40	18,20	26,39	- 6,64
	Passengers, thousands	35 717	32 432	33 068	33 161	33 117
	YIELD, cents €	7,2	7,5	7,5	7,7	7,9
easyJet	Operating profit per passenger	2,07	2,24	3,27	4,26	2,08
	Passengers, thousands	24 351	29 562	32 969	37 216	43 700
	YIELD, cents €	5,1	4,9	5,1	4,9	5,0
Ryanair	Operating profit per passenger	11,94	10,79	11,10	10,55	2,46
	Passengers, thousands	27 594	34 769	42 509	50 931	58 566
	YIELD, cents €	5,6	5,2	5,2	4,9	4,7

This Table demonstrates on selected examples how high performing companies demonstrated interplay of Operating profit per Passenger and Number of passengers, independently from Yield trends.

Irish discounter Ryanair demonstrated its dedication to aggressive growth (Number of passengers increases about 20% annually) and strong focus on Operating Profit per Passenger (~ 11 US dollars). Its

competitor FSNC British Airways in contrast, slightly decreased number of passengers, probably optimizing the routes, but focused on increase and maximization of Operating profit per passenger. Thus, BA recently offered regular service between London and New York with business class seats on board exclusively. Finally, another British LCC easyJet demonstrated slight but stable increase in both – Operating Profit (~ 2.8 dollars) and Number of Passengers (~ 15% per annum). In contrast, there was no single airline out of the poor performing ones, which could display such consistency per passenger performance over 5 years. However, highest Yields and Load Factors were attributable to Low performing airlines. In addition, it was a consistent increase or stability over 5 years for these metrics, unlike per passenger ones. On the other hand, some companies, improving Total Operating Profit, tried to increase Operating profit per Passenger or Number of Passengers (Flights) or increase both (Table 4). Such consistent patterns were attributable only to High Performers and none of the poor performers demonstrated this in financial statements. Moreover, companies with above-mentioned regularity had better share price performance than even profitable airlines without such regularity. Out of the above summary, we can accept that Operating Profit per unit of output is a stronger Performance indicator than Revenue per unit of output. The suggested denominator (Passengers) is equally good as passenger-kilometers and can be used independently of an airline's business model. Focus on number of Passengers and Target per passenger helped successful airlines to improve operating profitability and create company value.

Looking at Total Operating Profit (OP) as a multiple, we can formulate it in two ways.

$$OP = OP/PPK \times PPK \quad (1)$$

where OP/PPK is average Operating Profit per 1 Revenue Passenger-kilometer

$$OP = OP/PAX \times PAX \quad (2)$$

where OP/PAX is average Operating Profit per Passenger carried, PAX is Number of Passengers carried

Both multiplications result in Total Operating Profit, however targeting for example \$10 per passenger is more meaningful and clear rather than targeting 1 cent of Operating Profit per PPK. Being experts in their field and focusing on such figures, staff receives immediate awareness how they can improve \$10 per passenger and thus help the company achieving its financial profitability. For example, mean operating profit in America in 2004-2008 achieved \$0.2 per passenger compared with \$7.7 in Europe and \$8.1 industry average. A revenue increase about \$8.0 per passenger would hardly make a difference for the customer. Taking into account geographical specific of the US market where companies often have monopoly on routes, it raises the question: how difficult would it be to get extra \$8 per passenger in revenue?

Increase in revenues does not necessary mean an increase in airfares. Many LCCs fly with zero or negative profits and earn from ancillaries. Thus, every extra dollar in revenue multiplies profit by millions of passengers. This dollar in turn consists of multiple ancillaries (car rentals, hotel booking, in flight sales, etc.) and staff is motivated for such increase accordingly. On the other hand, flying with such thin margins is dangerous – should the number of passengers dropped, profit or loss will leverage accordingly. Nevertheless, recently American FSNCs successfully picked up some ideas from their LCCs competitors such as implementing ticketing and check-in luggage fees, which helps them now raising billions in ancillary revenue. Indeed, carrying most of the passengers worldwide, even 1 dollar in revenue per passenger multiplies by the greatest leverage.

To apply such approach successfully one should really question himself: “What is my leverage and what really drives my business?” In other words, “What effort and what payback is it for me to attract more passengers or to get an extra dollar in sales from each passenger?” For example, FSNCs have greater stability in number of passengers, and any efforts to increase their number or Load factor will not pay back if the revenue per passenger results in an inadequate operating profit. Moreover, if every passenger

brings a negative profit (because of insufficient revenue), then multiplied by tenths of millions of passengers, their business results in financial disaster. If we accept Passengers drive airline business, then we are looking for an overall target average profit per passenger by the passenger numbers. This is then broken down to fit the various routes, flights, classes and load factors. Not denying the importance of per RPK measures, we suggest for big traditional companies to use Operating Profit per passenger carried or per Seat sold as a tool in achieving Operating profit RPK. Such a simple and meaningful benchmark would be very helpful in developing and taking strategic decisions towards revenue and profit increase.

Operating Profit per Passenger in conjunction with Number of Passengers carried is a fundamental KPI, which we recommend to use for analysis, planning, benchmarking and certainly for internal reporting, in order to achieve operating profitability. Regular reports play valuable role in keeping the business on track. Airlines do track revenue, number of passengers and load factors quite frequently. If Average Operating Profit per Passenger will become a part of revenue management system this would greatly assist poor performing companies. Apart from revenue management, average Operating Profit per passenger can be tracked on daily and weekly basis against targets.

ACKNOWLEDGEMENT

This paper would be incomplete if it did not contain the fullest expression of my gratitude to Professor Dr. Hany Shawky, who has so generously given of his time and expertise; and not only with this paper but also throughout my PhD project. He has prompted and mentored my attempts to achieve a level of excellence with an open and gentle manner that created an environment for ideas to bear fruit and for me to believe in my own potential. His contribution has been invaluable and I thank him most sincerely! I also greatly appreciate input made by Professor Dr. Bill Holstein during our last session. Finally, I warmly thank Professor Dr. Keith N. Cleland for his sincere and fundamental participation.

FINDING THE OUTER LIMITS OF IRS ACCOUNTING DISCRETION: THE KOLLMAN CASE

Deborah K. Jones, Wayne State University
Albert D. Spalding, Jr., Wayne State University

ABSTRACT

Tax accounting in the United States involves the finding of a balance between an objective, theory-based approach to the clear reflection of income, on the one hand, and the accommodation of the somewhat less-than-completely-objective view of the Commissioner of Internal Revenue (whose motivation includes the optimization of the collection of tax revenues), on the other. The statutory language of the Internal Revenue Code gives cognizance to the methods of accounting used by taxpayers for their financial reporting, but the 1979 U.S. Supreme Court opinion of Thor Power acceded to the IRS a significant amount of discretion in its attempt to require taxpayers to change and adapt their accounting methods to its satisfaction. In particular, the Commissioner's seemingly absolute authority to prohibit lower of cost or market inventory valuation was upheld. Until the recent Tax Court decision in the case of United States v. Kollman, in fact, there were relatively few guidelines that helped to delineate the outer limits of the IRS's discretion in demanding taxpayer adherence to its preferred tax accounting methods. This paper considers how the parameters for a taxpayers' ability to challenge this discretion have been significantly clarified, if not changed, by the Kollman decision.

MITIGATING SUPPLY CHAIN DISRUPTIONS IN MANUFACTURING FIRMS

Adenike Aderonke Moradeyo, Pan-African University

ABSTRACT

The importance of effectively managing supply chain disruption is an important direction in the area of supply chain management. Companies need to be prepared on how to combat the supply chain disruption menace because of its need for proactive response whenever it occurs. This work using the non-logistic theories of contingency theory of fit proposed the need to fit the mitigating strategies against disruptions to the type of disruption and the environment. Likewise, following the main idea of the Theory of Constraint (TOC), the mitigating strategies against supply chain disruptions should concentrate efforts on the critical components in the supply chain. This is because the critical components determine the performance of the entire supply chain. The purpose of the study is to analyse the credible means of mitigating against supply chain disruptions.

KEYWORDS: Supply chain disruption, manufacturing firms, mitigating supply chain disruptions.

INTRODUCTION

The area of supply chain and distribution management is increasingly receiving attention in industries (Onwubolu et.al, 1999). Likewise, the management of supply chains in today's competitive world is increasingly challenging (Christopher and Lee, 2004). This is because supply chain management is fast becoming a source of competitive advantage. The increased prevalence of globalization over a period of time now has contributed significantly to the importance of supply chain performance among firms. Supply chain performance is very important to every firm in so much that it performs these two distinct functions which are: the physical and the market mediation functions. The physical function involves the conversion of raw materials into goods and the eventual transportation of these goods from one point in the supply chain to the next. The market mediation function which ensures that the variety of products reaching the market place matches what consumers want to buy (Chase, Aquilano and Jacobs, 2001).

Several unexpected and unpredictable occurrences that range from natural, human, social, economic and so on are sources of potential disruptions to supply chains. There are increasing numbers of compelling research illustrating the importance of effectively managing supply chain disruptions as well as the lack of preparedness of most companies (Blackhurst et.al, 2005). In general, supply chains have increased probability of disruptions because of globalization which increases the exposure to other countries' risks. This globalization also increases the number of geographic regions that a product passes through, thereby increasing the number of exposure to climatic and political catastrophes. This confirmed by Juttner (2005) in his findings that supply chains operating globally are more seriously affected by disruptions than those operating within a country. The bottom line is that disruptions are sources of risk and generally have negative effects on firms' performances. In cases where an unplanned event can cause production delays and corporate / network wide risk exposure, the negative outcomes can be tremendous and extremely costly (Hanna and Skipper, 2009). This emphasizes the importance of studies on supply chain disruptions by scholars (Blackhurst et.al, 2005). There is a large gap between the current environmental performance of manufacturing firms in developing and developed countries (Luken, Rompaey and Zigova, 2008). In as much as globalization has diluted the disparities (such as technological advancement and transfer, technical know how and so on) between production / operations management issues in developed / developing countries, pronounced differences still exist between these categories of countries (Onwubolu

et.al, 1999). Due to some environmental sources of disruptions as a result of geographical differences, there is the need to identify appropriate mitigation strategies suitable for manufacturing firms in developing / developed countries as the case may be.

The theoretical views employed and the research contributions in this work can be explained within the framework of the Contingency theory of fit and Theory of Constraints (TOC). The key concept in a contingent proposition is fit (Drazin and Van de Ven, 1985). According to Nadler and Tushman (1980) define congruence or fit as "the degree to which the needs, demands, goals, objectives and/or structure of one component are consistent with the needs, demands, goals, objectives, and/or structure of another component". TOC as related to supply chain management hinges on the need to identify critical components or bottlenecks for improvement within the supply chain. TOC is defined as a management approach which focuses on improving bottleneck processes to continuously improve the performance of manufacturing operations (Verma, 1997). This work reviews ways to mitigate against these disruptions. This work tries to answer the research question below:

- What are the credible ways of mitigating against supply chain disruptions?

LITERATURE REVIEW

Supply Chain Disruptions

Supply chains over the time have become more efficient, complex and likewise more vulnerable to different kinds of disruptions. As a result of this, the challenges of manufacturing firms are shifting from internal efficiency to supply chain efficiency (Olhager and Selldin, 2004). Disruptive events within a supply chain can significantly impact the performance of the supply chain's members (Chen and Xiao, 2009) which are now critical issues of many firms and the associated partners (Hendricks, Singhal and Zhang, 2009). Consequently, manufacturers should be aware of the need for good interactive relationship with vendors and customers. The possession of such good relationships and rapport can be classified as an intangible asset which is essential for the manufacturer's attempt to gain competitive advantage.

In addition, the ability to know and respond to customers' demands and turning these demands and practices into supplier selection criteria can facilitate the manufacturer to better satisfy the customer, forge a closer relationship with the customer and consequently winning out in the competition (Wang, Tian and Hu, 2005). A similar view is that all activities within a supply chain should be directed or focused towards satisfying the consumer's needs and to provide him with what he wants, how, where and when he wants it (Griffiths, James and Kempson, 2000). This can be attributed to the ability to respond to customers' needs wherever and whenever the products and services are demanded by them. This is one of the reasons for operations management. Reliability to customers is the ability to deliver the right product in the right quantity at the right time to the right place at the lowest possible cost while responsiveness is the ability to respond quickly to changing market conditions. Both reliability and responsiveness allow supply chains to create value by matching demand and supply (Hendricks and Singhal, 2008). The inability to match the demand of the market to that supplied by a manufacturing firm is one of the outcomes of a supply chain disruption.

Furthermore, the associated impact of a disruption on supply chain performance is a growing area of interest to many as they strive to reduce uncertainty in an attempt to better insulate their organisation's supply chain from the risks of a disruption (Hanna and Skipper, 2009). Therefore, supply chain disruptions can materialize either inside or outside a supply chain network and this is critical for supply chains to have planning systems in place that enable them to respond effectively to disruptions (Narasimhan and Talluri, 2009),(Bode and Wagner, 2006). Supply chain disruptions are an indication that the basic processes are not working as smoothly as desired (Hendricks and Singhal, 2008) because of

the kinds of uncertainties that can result from its occurrence. Hence, uncertainty in supply chain operation is closely related to supply chain disruptions as disruptions are unexpected events occurring in a supply chain (Wu, Blackhurst and O'Grady, 2007).

In addition, supply chain disruptions are described as unplanned and unanticipated events that disrupt the normal flow of goods and materials within supply chains (Hendricks and Singhal, 2003). Supply chain disruptions have been associated with operational and stock market performance and it is also associated with negative operating performance (Porterfield and Macdonald, 2009). In addition, supply chain disruptions can have long term negative effects on a firm's financial performance (Tang, 2006). On a similar note, supply chain disruptions can directly affect corporate stock prices by nearly 9% and revenue losses by 20% (Benyoucef and Forzley, 2007). The negative impact of supply chain disruption on customers is that the disruption hinders the ability of the supplier to meet customers' demand because it involves the major breakdown in the production or distribution nodes in the supply chain.

Furthermore, the most commonly reported supply chain disruptions are supplier capacity not meeting demand, raw material price increase or shortages, unexpected changes in customer demand, delayed or damaged or misdirected shipments, fuel price increases or shortages, terrorist attack, tsunamis, strikes, devaluation of currencies, transportation delays, port stoppages, accidents and natural disasters, poor communication, part shortages, quality issues, major global economic disruptions, cyber security failures, the risk of physical attacks on high profile company assets, operational issues (excess machine down time e.t.c.), political instability, abnormal weather events such as hurricanes, earthquakes, excessive wind, heavy rain, snow storms, fire, industrial and road accidents e.t.c. (Blackhurst et.al, 2005),(Kleindorfer and Saad, 2005),(Tang, 2006),(Stecke and Kumar, 2009),(Worthington , Collins and Hitt, 2009).

Bode and Wagner (2006) claimed supply chain disruption as one of the situations that leads to supply chain risk and that the supply chain vulnerability to disruptions also accounts for the unfavourable final outcomes. According to Kumar and Stecke (2009), it is the excessive focus on efficiency that makes supply chains to be more vulnerable to disruptions. In other words, efficiency enhancing practices that do not put into consideration the negative implications but tilted to the cost reduction benefit increase the potential vulnerability to disruptions. For instance, the movement of manufacturing plants of firms to Asia or Africa because of the associated low labour and raw material costs without adequate consideration of the possible risks peculiar to these environments. Consequently, Stecke and Kumar (2009) asserted that supply chain trends such as globalization, decentralization and outsourcing make supply chains efficient at the cost of increase in the number of exposure points. Similarly, supply chain initiatives such as outsourced manufacturing, Just-in-Time (JIT), Vendor Managed Inventory (VMI), increase product variety e.t.c. are effective in stable environment but found to create longer and complex global supply chains which are more vulnerable to disruption in turbulent environments (Tang, 2006).

Mitigating Supply Chain Disruptions

Managing the supply chain in a manufacturing firm is described as a challenging mission since a supply chain is a complicated system which is comprised of suppliers of various components, a manufacturer subject to uncertainty in both supply and demand, and the many customers of the finished goods that the manufacturer produces from those components. All these put together have the potential to exhibit both detail and dynamic complexity (Bozarth, Warsing, Flynn and Flynn, 2009). Therefore, it is essential for firms to adopt mitigation tactics against the supply chain disruptions in order to prevent the disruption of the supply chain system. Stecke and Kumar (2009) are of the view that preparation time which is the time between the forecast or awareness and the occurrence of a catastrophe, could be important in mitigating planning. Mitigation tactics are those in which the firm takes some action in advance of a disruption and so incurs the cost of the action regardless of whether a disruption occurs or not. The mitigation factors or strategies should help a firm to reduce cost and / improve customer satisfaction under normal

circumstances and should be able to sustain a firm's operations during and after a major disruption (Tang, 2006). Therefore, robust strategies that are resilient yet efficient need to be developed by manufacturing firms in order to secure their supply chains. Likewise, the contingency tactics are equally important as tools for managing supply chain disruptions.

In addition, Tang (2006) emphasized the usefulness of robust strategies which are strategies that enable firms to manage regular fluctuations efficiently under normal circumstances regardless of the occurrence of major disruptions; they help firms to sustain its operations during a major disruption and could make a firm to be more resilient. The robust strategies are postponement, strategic shock, flexible supply base, make-and-buy, economic supply incentives, flexible transportation, revenue management via dynamic pricing and promotion, assortment planning, silent product rollover and so on (Tang, 2006).

THEORETICAL JUSTIFICATION

Supply Chain Management (SCM) is often explained further by referring to theories or concepts from both logistics as well as non-logistics disciplines. This study uses the non-logistics theories, that is, contingency theory and the theory of constraint as the basis for the development of theoretical frameworks for gaining better insight of mitigating strategies against supply chain disruptions. The theories are used to explain credible mitigating strategies that can be used against supply chain disruptions in order to ensure an effective and efficient supply chain.

Contingency Theory of Fit and Mitigation of Supply Chain Disruptions

In a bid to tackle the supply chain disruptions plaguing manufacturing firms, the concept of fit posits as a useful tool. It is an interesting insight to note that there is high probability of success or better outcomes because of alignment of mitigating strategies with disruption and or the environment. This is plausible and should not be undermined. In essence, the view is that there is a mitigating strategy that best fits a particular disruption. This is a similar view to the work of Stecke and Kumar (2009) who developed a framework that connect a variety of mitigating strategies to appropriate disruption types.

According to Van de Ven (1979), the concept of "fit," which is rooted in the population ecology model and in the contingency theory tradition, has served as the central thrust to the development of middle range theories in many management disciplines. The concept of fit has served as an important building block for theory construction in several areas of research including strategic management (Venkatraman, 1989). The importance of the concept of fit stems from the ability to predict performance based on fit of the factors in consideration (Butterman, Germain and Iyer, 2008). Venkatraman in his study in ensuring a development of a strong link between verbalizations and statistical testing schemes established a conceptual framework and identified six perspectives of fit as: moderation, mediation, matching, gestalts, profile deviation and co variation. On the other hand Drazin and Van de Van (1985) classified the forms of fit using the selection approach, interaction approach and the system approach (Sousa and Voss, 2008). The approach adopted in this study is the selection (matching) approach which interpretes fit as congruence between those structure and process variables that are highly correlated with context. In other words, match is better than mismatch between two or more entities. Furthermore, Drazin and Van de Ven (1985) emphasized that the key concept in a contingent proposition is fit. In support of the notion of fit as it relates to supply chain, Sun, Hsu and Hwang (2009), are of the view that successful manufacturing firms must understand that the right supply chain strategy is necessary to align with different environmental uncertainties in order to sustain competitive advantage.

Sun, Hsu and Hwang (2009) in their work asserted that alignment (fit) between environmental uncertainties and supply chain strategies would positively impact supply chain performance. It is worth noting that the mitigating factor employed against a kind of supply chain disruption may not necessarily

be suitable for other kinds of disruptions (Ope and Gopalakrishnan, 2009). Also, there is the tendency for the supply chain disruption's mitigation tactic used in one country not to work for another country (especially those in the developed and developing world) because of the need to be creative rather than adaptive when looking for mitigating factors against disruptions. In other words, the approaches used to mitigate a supply chain disruption should fit the attributes of the disruption in question and likewise the environment concerned. This view is supported by Kleindorfer and Saad (2005) who argued that to effectively manage risk, the approaches used must fit the characteristics and needs of the decision environment. It is an acknowledged fact that firms are subjected to the external environment where they operate in. This means that companies need to adjust their strategies according to the political, economic, social and technological environments that they operate in (Wang, Tian and Hu, 2005).

This work is of the a priori assumption that there should be alignment between the environment and the mitigating factors against supply chain disruption for there to be efficient and successful outcomes. Also, to note that there would be some mitigating strategies against supply chain disruption that would be specific to certain type of disruption. Therefore, it may not be expedient to assume that mitigation strategies against disruptions are generic. Hence, the following propositions are derived from the previous arguments and follows is the theoretical model (figure 1);

P1: A mitigating factor against a supply chain disruption would be more likely to be more effective if it fits the unique attributes of a particular disruption.

P2: A mitigating factor against a supply chain disruption would be more likely to be more effective if it fits the particular attributes of the environment.

THEORETICAL MODEL 1

Figure 1: Contingency Theory and Mitigating of supply chain disruption

Theory of Constraint (TOC) and Mitigation of Supply Chain Disruption

TOC is defined as a management approach which focuses on improving bottleneck processes to continuously improve the performance of manufacturing operations (Verma, 1997). Similarly, this philosophy hinges on the fact that constraints determine the performance of a system (Onwubolu et.al, 1999). TOC identified organisation constraints to be either physical (people, demand level, machines or material) or managerial-policy related (Rahman, 2002). It is important to recognize the division of the total portfolio of supply tasks into different categories that are relevant to the particular organisation and these priorities vary from organisation to organisation (Saunders, 1997). Saunders further analyzed the fact that this approach helps in recognizing different priorities and can give a guide to the allocation of time, effort and the selection of appropriate courses of action. This idea can be likened to the Pareto's analysis where priorities are established based on the values placed on the subjects considered. Hoole (2005) emphasized the simplification of supply chain as a means of enhancing overall performance and thereby proposed the Complexity Reduction Framework for breaking down supply chain complexity into its component parts. Hoole argued that a supply chain is a process view of a company's logistical activities which makes it appropriate to break the supply chain into its process elements. The breaking of the supply chain into its component parts will help in identifying the critical (weak links) and non-critical components.

TOC is based on the fact that every process is a chain of operations and that every chain is as strong as its weakest link or constraint (Perez, 1997). Consequently, the weakest link or constraint or bottleneck in the chain is usually most affected and eventually determines the performance of the whole chain (Goldratt and Cox, 1984). A disruption affects a supply chain by affecting one or more of its components which could be internal or external (Kumar and Stecke, 2009). From the supply chain perspective, this depicts that in the entire chain, it is important for an organisation to identify the weak links (which are usually few in the system) which are more susceptible or vulnerable to disruptions (Onwubolu et.al, 1999). In other words, it is important for an organisation to focus the mitigation efforts on disruptions that have higher probability or tendencies of affecting the critical components (Kumar and Stecke, 2009).

One of TOC's philosophies is that "an hour lost at the critical component is an hour lost for the entire plant but an hour lost at a non-critical component is only a mirage". Therefore, this philosophy can be related to the supply chain as in "the impact of supply chain disruption on a critical component affects the entire supply chain but the impact of the same disruption on a non-critical component is minimal or negligible". Hence, the following propositions are developed from the argument and follows is the theoretical model (figure 2);

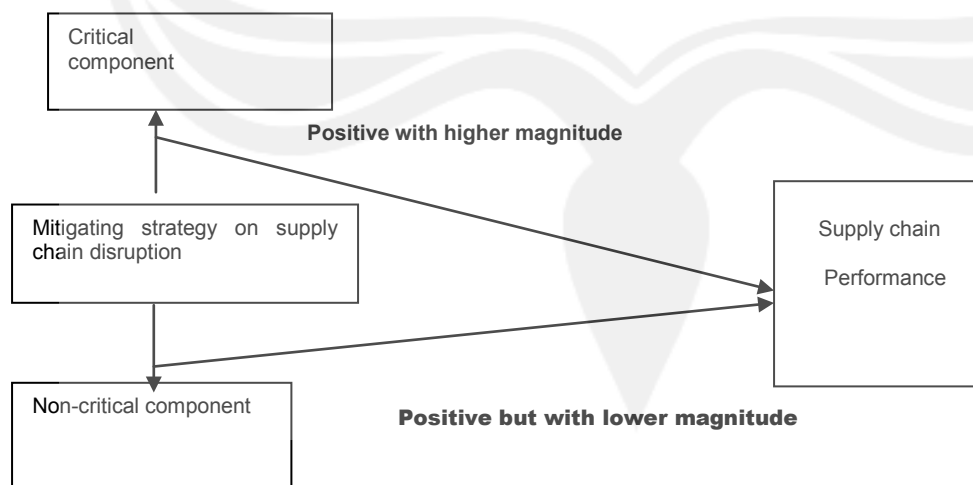

P3: A critical component of a supply chain would be more likely to determine the performance of the supply chain than the non critical component.

P4: An unplanned event that disrupts a critical component of a supply chain would be more likely to be more severe than the same supply chain disruption affecting a non -critical component of the same supply chain.

P5: Mitigating efforts against disruptions that affect a critical component of a supply chain would be more likely to be more credible than the same mitigating efforts against disruptions that affect a non critical component.

THEORETICAL MODEL 2:

Figure 2: Theory of Constraint (TOC) and Mitigation of supply chain disruption

CONCLUSION

According to Buttermann, Germain and Iyer (2008), the match of strategy to environment predicts performance. As an analogy, Bruun and Mefford (1996) confirmed that little or no attention is given to the environment's unique attributes in developing countries in strategy adoption rather strategies are made to conform to those of other developing countries or industrial countries. This depicts that strategies are followed blindly without putting the environmental implications into consideration. It is important for developing countries to adopt R&D that are creative rather than the adaptive ones that they are used to (Kumar and Saqib, 1996), that is, as adopted from the developed countries. For instance, Oyelaran-Oyeyinka, Laditan and Esubiyi claimed that the Nigerian industries have adaptive innovation to account for the bulk of technical change process. The unique attributes of the developing countries (Juttner, 2005) will have a way of increasing the severity of supply chain disruptions on manufacturing firms' performance. This if looked at from the angle of supply chain depicts that it is better for manufacturing firms to adopt creative mitigation tactics that are unique to the environment rather than adopting and adapting to the tactics used for mitigating supply chain disruption in other places. On a similar note, certain supply chain disruptions would need their own specific mitigating strategies that fit them rather than using generic mitigating strategies. This is to enable efficient and credible outcomes.

Finally, it is important for manufacturing firms to identify the critical components in their supply chains. This will enable them to concentrate the mitigating efforts on the critical components in the supply chain as these affect the actual performance of the entire supply chain.

TWO LINES OF DEFENCE FOR OVERCOMING PRODUCT DEFICIENCIES: DEALING WITH THE EFFECTS OF ACCELERATED NPD AND NEWNESS ON PRODUCT QUALITY

Yevgeniya D. Kim, Eindhoven Technical University, The Netherlands

Joost P.M. Wouters, Eindhoven Technical University, The Netherlands

Ed J.Nijssen, Eindhoven Technical University, The Netherlands

ABSTRACT

For many firms accelerating new product development involves important trade-offs with product quality. Lower quality but also serious deficiencies may occur and reduce customer satisfaction if no additional actions are taken. In this study two lines of defence are distinguished against such negative effects of acceleration: customer orientation to prevent and service recovery to repair such problems. The model is tested using a sample of Dutch firms involved in developing new products. Results show that only the combination of good customer-orientation and after sales service (two lines of defence) can improve customer satisfaction.

INFORMATIVENESS OF LIMIT ORDER BOOKS AND ORDER SUBMISSION BEHAVIORS OF INSTITUTIONAL AND INDIVIDUAL INVESTORS IN ELECTRONIC CONTINUOUS AUCTION MARKETS

Matthew C. Chang, Hsuan Chuang University
Jui-Cheng Hung, Chinese Culture University

ABSTRACT

We find that best bid/ask depths as well as minor depths on limit order books are informative for 5-min stock return. Furthermore, marketable order flows are positively related to returns. On the other hand, the informational contents of nonmarketable order flows, are negative. The cancellation rates of nonmarketable orders are surprisingly high, especially for institutional investors. For individual investors, both marketable and nonmarketable cancellation/submission ratios are significantly less than 1. For institutional investors, only marketable cancellation/submission ratio is less than 1. The nonmarketable cancellation/submission ratio, however, is near to 1. Since most nonmarketable orders from institutional investors are cancelled, they hurt less than individual investors. We conjecture that the difference in informational content between best depth and minor depth is due to the trading mechanism on the TWSE. Auction happens for each stock about every 20 to 30 seconds. Investors are free and costless to cancel their orders.. Thus, individual investors offer more persistent nonmarketable depths provision, and it is consistent with the assumption that individual investors are noise traders. On the contrary, institutional investors are informed traders. We further apply Vector Auto Regression (VAR) to investigate institutional investors' marketable/nonmarketable submission/cancellation and find that institutional investors submit and cancel nonmarketable orders due to searching for demanding liquidity.

PROMOTION FOR THE HOSPITALITY/TOURISM MANAGEMENT PROGRAM OF HTM SCHOOLS: COMPETITIVE ADVANTAGE STRATEGY

Kristy Aireen G. Gallato-Reamillo, Saint Mary's University

Cristina G. Gallato, Universiti Utara Malaysia

ABSTRACT

The demands of professionalism in the complex hospitality industry have brought about the offering of the Hospitality and Tourism Management (HTM) Program. The various job opportunities overseas for graduates of this program dictate that the quality of Hospitality and Tourism Management Education must be upgraded and sustained. It is therefore imperative for schools offering this program to have it accredited and make it more attractive, marketable and competitive in order to stay ahead. Such competition has created a threat to universities offering the program which prompted them to operate as a business entity and therefore adopt business practices such as promotion or advertising activities without sacrificing the quality of education, inasmuch as students who graduate year after year face many challenges when finding a job in today's competitive job market. Graduates must meet the expectations of prospective employers. Thus, academic hospitality programs are competency-based that will prepare the students to be competitive in the workplace. This paper aims to assess the current status of the Bachelor of Science in Hospitality and Tourism Management program with the objective of developing a promotion plan, thus helping the various HTM schools/universities to stay competent in the field of Hospitality and Tourism Management education.

GLOBAL PRODUCTION AND INTERNATIONAL COORDINATION COSTS

Wanida Ngienthi, Assumption University

ABSTRACT

In this paper, a general equilibrium model has been constructed to study the impacts of falling international coordination costs on the wage inequality and offshoring. The results show that falling international costs narrows the wage inequality in the south, but widens that in the north. In addition, under the regularity condition of technological progress, we can show that a reduction in international coordination costs improves the competitiveness of offshoring firms by lowering the relative price of the products that they produce, which in turn stretches the borderline of offshoring. As a consequence, a reduction in international coordination costs leads to an expression of offshoring.

JEL: F16; F23; O19

KEYWORDS: Offshore, multinational, international coordination costs

INTRODUCTION

One of the most widely discussed topics in international trade since the last few decades is about globalization and wage inequalities. An increase in wage inequality between unskilled workers and skilled workers in the U.S. since early 1980s has aroused several phases of debate over the issues. In the recent growth of world trade, Yi (2003) shows that GATT-induced tariff reductions, technological progress, and emerging markets are the forces that point to a larger role of vertical specialization, which occurs when countries specialize only in particular stage of production process. More recently, Kimura and Ando (2005) demonstrate that the share of machinery parts and components in the total exports of the East Asian developing countries increased from 20 percent to 30 percent on average during the period 1990-2000. The growing importance of trade in intermediate inputs in the world economy and the prominent role of international coordination in today's globalization have motivated this paper. Even though there are existing papers on this literature, the studies are still limited compared to its significance. In this paper, I develop a general equilibrium model to study the impacts of falling international coordination costs on the wage inequality and offshoring. The model incorporates trade in intermediate inputs and international coordination costs together. I apply the North-South intermediate input trade model of Feenstra and Hanson (1996) by introducing multinationals or offshoring firms into their model. Additionally, for capturing the role of international coordination costs, I allow offshoring firms to formulate international team as in the paper of Antras, Garicano, and Rossi-Hansberg (2006). This paper thus highlights the role of international coordination costs of multinationals or offshoring firms, which is not captured by the original paper of Feenstra and Hanson (1996).

In my model, a fall in international coordination costs leads to a standard result in which it depresses the relative wage of the southern skilled workers, but raises that of the northern skilled workers. As a result, the wage inequality between skilled workers and unskilled workers in the south decreases, while that in the north increases. Under the regularity condition of technological progress, I can say that a fall in international coordination costs improves the competitiveness of offshoring firms by lowering the relative price of intermediate inputs that they produce, which stretches the borderlines of offshoring. As a consequence, it finally leads to an expansion of international outsourcing or offshoring. This paper is organized as follows. Section 2 provides the review of literature. Section 3 describes the model. Section 4

determines a general equilibrium. Section 5 demonstrates the effects of a reduction in international coordination costs on the relative wages and offshoring. Section 5 offers the conclusion.

LITERATURE REVIEW

There is no standard definition of “offshoring” both in public debate and in economic literature. However, the term is widely used as a part of “outsourcing”. In general, outsourcing refers to a transfer of some of a company’s non-core activities to outside providers, which can be either domestic or international. According to World Trade Organization (WTO) (2005), domestic outsourcing involves buying services or input materials from a non-affiliated firm in the home country where a core operation is located. In contrast, international outsourcing involves importing services or input materials from a non-affiliated firm in another country and it is a part of offshoring. In particular, offshoring refers to a situation in which services or input materials are sourced from abroad, which can be conducted either in-house or at arms-length.

However, there are somewhat different terminologies such as fragmentation. The term “fragmentation” is defined as a situation in which segments (production blocks) of vertically integrated production processes are located in different locations either in the home country or abroad. Since there is a considerable overlap among outsourcing, offshoring, and fragmentation; in some papers all terms are used interchangeably.

In my paper, the main focus is a transfer of some parts of a firm’s production processes from one country to another country. Since I am not interested in a firm’s make-or-buy decision, the outsourced parts can be conducted either in-house or at arms-length. Strictly speaking, my paper includes outsourcing, offshoring, and fragmentation. For capturing a wide scope of viewpoint, I decide to use all the mentioned terms interchangeably in my model.

There is a great deal of research in this literature with different uses of terminology. Despite the differences, the effects on wage inequality are a question of interest. Feenstra and Hanson (1996) demonstrate that a growth in capital or technology in the south will lead to the increased outsourcing from the north to the south. They show that the relative wage of skilled labor increases in both countries as a result of higher demand for skilled labor. In contrast, Jones (2000) shows a surprising result. He argues that, for a capital-abundant country where the fragmented commodity is a labor-intensive item of the goods produced initially, international fragmentation acts as technological improvement in the labor-intensive sector and thus improves the wage rate. This phenomenon shows a possibility in which the relative wage of the northern unskilled labor may increase despite the fact that their tasks are outsourced to the south.

Besides, Grossman and Rossi-Hansberg (2008) construct a simple theory of offshoring to study the effects of falling costs of offshoring on factor prices in the source country. In their paper, a term “task trade” has been introduced to describe globalization of production. They show that a fall in offshoring costs induces a productivity effect, a relative-price effect, and a labor-supply effect. The productivity effect is derived from the costs savings when firms offshore. The relative-price effect comes from changes in the terms of trade. The labor-supply effect is derived from the reabsorption of workers whose tasks are offshored.

Recently, the role of international coordination costs has brought a new challenge to research. A reduction in international coordination costs as a result of technological progress seems to be another important factor that affects offshoring and wage inequality. According to the existing papers, the role of international coordination costs is captured in slightly different ways. For example, Antras, Garicano, and

Rossi-Hansberg (2006) focus on the costs of communication between managers and workers; while Anderson, Tang, and Wood (2006) focus on international business travel and cooperation costs. Jones and Kierzkowski (2005) explore the importance of increasing returns in service links for the fragmentation. The service links, such as communication and transportation, are required to coordinate the separated fragments. It includes also the general costs of coordination or the acquisition of relevant information. The role of service links in their model is similar to that of international coordination in my model, except that they take service link costs as fixed costs. However, they do not consider the international team as I do in my paper. Moreover, in their studies they explain the results by using a diagrammatic model, while in my paper I build a general equilibrium model. Despite the differences, our models share the same result in which the falling costs of coordination lead to an increase in international fragmentation.

Wan Jr. (2005) proposes a general equilibrium model of international fragmentation by applying Jones and Kierzkowski model to the contract manufacturing service industry. In his paper, the service links are assumed to be managerial job that requires the labor for managing the production chain. The fixed costs of service links are regarded as managerial labor costs, which incurred in those countries within the same supply chain. When the number of countries in the chain becomes larger, the fixed managerial labor costs of managing supply chain increase.

Anderson, Tang, and Wood (2006) analyze the effects of falling costs of international business travel and communication on wage inequality. In their paper, the service link costs of highly-skilled northern workers are higher in the south than in the north because of extra time that they need to spend on the travel and communication. The paper shows that reduction in the time wasted encourages the highly-skilled northern workers to do more work in the south. However, it is not necessary that the work of highly-skilled workers in the north becomes less because lower cooperation costs tend to raise the effectiveness of highly-skilled northern workers. Due to this fact, more highly-skilled work in the south need not imply less highly-skilled work in the north. My model is similar to their model in that we focus on the impacts of falling international coordination costs on the wage inequality. However, since their analysis is not based on the framework of offshoring, there is no prediction about the effects of falling international coordination costs on offshoring in their model.

MODEL

The model consists of two main parts: trade in intermediate inputs and international coordination costs. We suppose that there are two countries: North (N) and South (S); and two types of labor: unskilled labor (L) and skilled labor (H). A single final manufactured good is assembled from a continuum of intermediate inputs, which are indexed by $z \in [0,1]$. Each unit of input z uses $a_L(z)$ of unskilled labor and $a_H(z)$ of skilled labor, in which $a_L(z)$ and $a_H(z)$ represent fixed input-output coefficients for intermediate input production. We arrange inputs in such a way that the ratio of $\frac{a_H(z)}{a_L(z)}$ is increasing in z .

The introduction of multinationals into the model of Feenstra and Hanson (1996) creates three types of firms: S-firm (S), N-firm (N), and M-firm (M). The S-firm and N-firm are local firms in the south and the north, respectively; while the M-firm is a multinational firm that locates its production plants in the south and headquarter in the north.

To produce intermediate inputs, we require unskilled and skilled labor in a Leontief function or fixed input-output coefficients:

$$x_i(z) = A_i \min \left\{ \frac{L_i(z)}{a_L(z)}, \frac{H_i(z)}{a_H(z)} \right\}, \quad \text{for } z \in [0,1], \quad (1)$$

where $x_i(z)$ represents the i -firm's total output of intermediate inputs with index z , $a_L(z)$ and $a_H(z)$ represent the fixed input-output coefficients, $L_i(z)$ and $H_i(z)$ represent the i -firm's total labor employment for the production of intermediate inputs with index z , A_i is a constant productivity or technology parameter, and $i = S, M, N$ types of firms.

It is important to notice that $a_L(z)$ and $a_H(z)$ are identical across firms. This implies that all firms' intermediate input production technologies are the same and that $a_L(z)$ and $a_H(z)$ take no account of international coordination costs. In order to capture the role of international coordination costs, we assume hereafter that $A_M < A_S = A_N = 1$. By this assumption, it implies that after taking the costs of international coordination into account, the M-firm's technology becomes inferior to that of the S-firm and N-firm.

The final manufactured good (Y) is assumed to be costlessly assembled (in either country) in the Cobb-Douglas function over all the inputs:

$$\ln Y = \int_0^1 \alpha(z) \ln D(z) dz, \quad \text{with} \quad \int_0^1 \alpha(z) dz = 1, \quad (2)$$

where Y denotes the total output of final good and $D(z)$ denotes the demand for intermediate inputs with index $z \in [0,1]$.

We will denote the countries' fixed endowments of unskilled labor and skilled labor by L_S, H_S for the south, and L_N, H_N for the north; with the factor prices denoted by w_S, q_S and w_N, q_N , respectively. We assume that the south is relatively unskilled labor-abundant country, whereas the north is relatively skilled

labor-abundant country. That is, $\frac{L_S}{H_S} > \frac{L_N}{H_N}$, which follows that $\frac{q_S}{w_S} > \frac{q_N}{w_N}$.

For simplicity, we assume hereafter that $a_L(z) = 1$ for all z , and $a_H(z) = z$. This simple assumption allows us to simply interpret index $z \in [0,1]$ as the skill intensity of intermediate inputs. Then, we have the following unit-cost functions:

$$\text{S-firm: } c_S(w_S, q_S, z) = w_S + q_S z, \quad (3)$$

$$\text{M-firm: } c_M(w_S, q_N, z) = \frac{w_S + q_N z}{A_M}, \quad (4)$$

$$\text{N-firm: } c_N(w_N, q_N, z) = w_N + q_N z. \quad (5)$$

We now distinguish the offshoring firms from local firms by focusing on the role of international coordination costs. Let us assume that each firm has two divisions: headquarters and production plants. The headquarter activities, for example, R&D or problem solving, require skilled labor or managers; while the production plant activities, for example, assembly or routine jobs, require unskilled labor or workers. In our model, the S-firm and N-firm do not undertake offshoring, thus their headquarters and production plants are located within the south and the north, respectively. The M-firm, on the other hand, undertakes offshoring and locates the headquarter in the north and production plant in the south. Based on the international team formation of the M-firm, we further assume that every southern worker of the M-firm splits his labor time into a fraction A_M for production and a fraction $1 - A_M$ for international coordination and every northern manager of the firm does the same thing.

Figure 1: The Unit-Cost Lines

This figure shows the unit cost lines of all firms that are expressed by the unit-cost functions in (3)-(5). It also shows that the locus of minimum costs for intermediate inputs produced by each firm is increasing in z at any fixed wage rates.

In general, firms who produce the final good will source the inputs from the minimum-cost location. If the unit costs were lower at the south, then all inputs would be produced there, and vice versa. In this model, we are interested in the case where there is production sharing across three firms. That is, we focus on the situation in which three firms coexist. For this coexistence, we impose the following borderline relations as shown in Figure 1:

$$0 < z_1 < z_0 < z_2 < 1, \quad (6)$$

where z_0 is a point in which $c_S(z_0) = c_N(z_0)$, z_1 is a point in which $c_S(z_1) = c_M(z_1)$, and z_2 is a point in which $c_M(z_2) = c_N(z_2)$.

In Figure 1, we explicitly focus on the borderlines z_1 and z_2 . According to these borderlines and the minimum-cost location, we can see that the S-firm's unit costs are the lowest for $0 < z < z_1$ so that the S-firm will specialize in inputs with index $z \in [0, z_1]$. The M-firm's unit costs are the lowest for $z_1 < z < z_2$ so that the M-firm will specialize in inputs with index $z \in [z_1, z_2]$. The N-firm's unit costs are the lowest for $z_2 < z < 1$ so that the N-firm will specialize in inputs with index $z \in [z_2, 1]$.

Our model shares a similar viewpoint to Lu (2007). Lu (2007) shows that there are three industries: low-tech, medium-tech, and high-tech industries. The low-tech parts are produced in the south, the medium-tech parts are produced by MNCs or FDI in the south, and the high-tech parts are produced in the north. However, there is no presence of international team structure in her model as we highlight here.

GENERAL EQUILIBRIUM DETERMINATION

In this model, we require five conditions to determine the general equilibrium. There are two borderlines conditions, one balance of payments equilibrium condition, and two full-employment conditions. The following will show how each condition is derived. From Figure 1, it is easy to show that the borderlines z_1 and z_2 are, respectively, expressed as

$$z_1 = \frac{1 - A_M}{\frac{q_S}{w_S} A_M - \left(\frac{\frac{q_N}{w_N}}{\frac{w_S}{w_N}} \right)}, \quad (7)$$

$$z_2 = \frac{\frac{w_S}{w_N} - A_M}{\frac{q_N}{w_N} A_M - \frac{q_N}{w_N}}. \quad (8)$$

From (7) and (8), we can say that the borderlines z_1 is a function of $\frac{q_S}{w_S}, \frac{q_N}{w_N}, \frac{w_S}{w_N}$, and A_M and that the borderline z_2 is a function of $\frac{q_N}{w_N}, \frac{w_S}{w_N}$, and A_M . Then, we have two borderline conditions as follows:

$$z_1 = f_1 \left(\frac{q_S}{w_S}, \frac{q_N}{w_N}, \frac{w_S}{w_N}, A_M \right), \quad (9)$$

$$z_2 = f_2 \left(\frac{q_N}{w_N}, \frac{w_S}{w_N}, A_M \right). \quad (10)$$

Let us now consider the balance of payments equilibrium condition. To obtain this condition, we have to start from the budget constraint for each country. The budget constraint posits that the value of aggregate demand must be restricted to, and equal to, the value of production. That is,

$$\text{value of aggregate demand} = \text{value of production}. \quad (11)$$

According to the minimum-cost locations, the S-firm produces S inputs in the south, while the N-firm produces N inputs in the north. The M-firm fragments M inputs into unskilled and skilled parts. The unskilled parts are produced in the south by the southern unskilled labor (workers), while the skilled parts are produced in the north by the northern skilled labor (managers).

In free-trade equilibrium, the south's value of import demand must equal the north's value of import demand. That is, the balance of payments equilibrium condition is expressed as

$$\int_{z_2}^1 p(z) D^S(z) dz + \int_{z_1}^{z_2} p_H(z) D^S(z) dz = \int_0^{z_1} p(z) D^N(z) dz + \int_{z_1}^{z_2} p_L(z) D^N(z) dz, \quad (12)$$

From which, the balance of payments equilibrium condition can be written as a function of $\frac{q_S}{w_S}, \frac{q_N}{w_N}, \frac{w_S}{w_N}, z_1$, and z_2 . That is, we have

$$f_3 \left(\frac{q_S}{w_S}, \frac{q_N}{w_N}, \frac{w_S}{w_N}, z_1, z_2 \right) = 0. \quad (13)$$

Now, we consider the full-employment conditions for the north and the south. In the model, the S-firm employs the southern unskilled and skilled labor, the M-firm employs the southern unskilled labor and the northern skilled labor, and the N-firm employs the northern unskilled and skilled labor. It follows that, for the south, full-employment conditions for the two types of labor are given by $L_S = L_{SS} + L_{MS}$, and $H_S = H_{SS}$, where L_S and H_S are the fixed endowments of the southern unskilled and skilled labor, L_{SS} is the S-firm's total demand for the southern unskilled labor, L_{MS} is the M-firm's total demand for the southern unskilled labor, and H_{SS} is the S-firm's total demand for the southern skilled labor.

To determine the full-employment conditions, we use the market-clearing conditions for each input. For the south, the relative demand for the southern skilled labor is a function of $\frac{q_S}{w_S}, \frac{q_N}{w_N}, \frac{w_S}{w_N}, z_1$, and z_2 , which is written as

$$RD_S = f_4 \left(\frac{q_S}{w_S}, \frac{q_N}{w_N}, \frac{w_S}{w_N}, z_1, z_2 \right). \quad (15)$$

Analogously, for the north, the function of relative demand for the northern skilled labor is

$$RD_N = f_5 \left(\frac{q_N}{w_N}, \frac{w_S}{w_N}, z_1, z_2 \right). \quad (16)$$

Consequently, from the above, it follows that the full-employment conditions for the south and the north are, respectively,

$$f_4 \left(\frac{q_S}{w_S}, \frac{q_N}{w_N}, \frac{w_S}{w_N}, z_1, z_2 \right) - \frac{H_S}{L_S} = 0, \quad (17)$$

$$f_5 \left(\frac{q_N}{w_N}, \frac{w_S}{w_N}, z_1, z_2 \right) - \frac{H_N}{L_N} = 0. \quad (18)$$

In summary, the general equilibrium of the model is described by the borderline conditions in (9) and (10), the balance of payments equilibrium condition in (13), and the full-employment conditions in (17) and (18). Let x_1, x_2, x_3 denote $\frac{q_S}{w_S}, \frac{q_N}{w_N}$, and $\frac{w_S}{w_N}$, respectively. Then, we have

$$z_1 = f_1(x_1, x_2, x_3, A_M), \quad (19)$$

$$z_2 = f_2(x_2, x_3, A_M), \quad (20)$$

$$f_3(x_1, x_2, x_3, z_1, z_2) = 0, \quad (21)$$

$$f_4(x_1, x_2, x_3, z_1, z_2) - \frac{H_S}{L_S} = 0, \quad (22)$$

$$f_5(x_2, x_3, z_1, z_2) - \frac{H_N}{L_N} = 0, \quad (23)$$

as a system of equations in a general equilibrium model. Therefore, in our model there are five equations for five unknowns—the relative wages (x_1, x_2, x_3) and the two borderlines (z_1, z_2).

EFFECTS OF A REDUCTION IN INTERNATIONAL COORDINATION COSTS

In this section, we study how a reduction in international coordination costs affects relative wages and borderlines. We suppose that there is an exogenous shock, or a technological progress in telecommunication that leads to a reduction in international coordination costs. This implies that a technological advance takes place only the M-sector or M-firm. As a consequence, A_M rises as a result of an improvement in the M-firm's technology. We assume that the resultant A_M still satisfies the borderline relations in (6).

From the system of equations that we discussed above, the relative demands for skilled labor can be written as the functions of x_1, x_2 , and A_M . Then we totally differentiate and obtain

$$\text{South: } (dRD_S) = s_1 dx_1 + s_2 dx_2 + s_M dA_M = 0, \quad (24)$$

$$\text{North: } (dRD_N) = n_1 dx_1 + n_2 dx_2 + n_M dA_M = 0. \quad (25)$$

From (24) and (25), we have

$$\begin{bmatrix} s_1 & s_2 \\ n_1 & n_2 \end{bmatrix} \begin{bmatrix} dx_1 \\ dx_2 \end{bmatrix} = - \begin{bmatrix} s_M dA_M \\ n_M dA_M \end{bmatrix}. \quad (26)$$

Let us call s_2 and n_1 the foreign-wage effects on the relative demands for skilled labor. We assume that this coefficient matrix has dominant diagonal, that is, $|s_1| > |s_2|$ and $|n_1| < |n_2|$. By using Cramer's rule, we can obtain the following linear functions:

$$dx_1 = \frac{1}{s_1 n_2 - s_2 n_1} (s_2 n_M - n_2 s_M) dA_M, \quad (29)$$

$$dx_2 = \frac{1}{s_1 n_2 - s_2 n_1} (n_1 s_M - s_1 n_M) dA_M, \quad (30)$$

where $s_1 n_2 - s_2 n_1 > 0$.

We consider a standard case in which there is no foreign-wage effect or $s_2 = 0$ and $n_1 = 0$. After an exogenous shock ($dA_M > 0$), we have $dx_1 = -\frac{s_M}{s_1} dA_M < 0$ and $dx_2 = -\frac{n_M}{n_2} dA_M > 0$, which are the effects of falling international coordination costs on the relative wage of skilled labor in the south and the north, respectively. The impacts of a fall in international coordination costs on wage inequality can be

inferred straightforwardly. That is, when there is no foreign-wage effect, a reduction in international coordination costs is likely to narrow the wage inequality between skilled and unskilled labor within the south ($dx_1 < 0$), but to widen the wage inequality within the north ($dx_2 > 0$).

Now, we will analyze the effects of a reduction in international coordination costs on offshoring. We assume that technological advance that reduces international coordination costs follows a regularity condition of Jones (1979). That is, if technological progress is regular, it follows that the relative prices of M inputs fall. Under the regularity condition of technological progress, the relative prices of inputs must change in such a way that the relative price of M-input in terms of S-input (c_{MS}) and that of M-input in terms of N-input (c_{MN}) decrease. That is, the price of the M inputs reduces relative to that of other inputs. Without loss of generality, we assume that the prices of S-input and N-input are constant, which implies that the minimum-cost-locus line $c_M c_M$ shifts downwards relative to the lines $c_S c_S$ and $c_N c_N$. Then, Figure 1 shows that after a fall in international coordination costs, the minimum-cost-locus line $c_M c_M$ shifts to the line $c'_M c'_M$. As a consequence, the borderlines of offshoring are stretched from $z_1 z_2$ to $z'_1 z'_2$.

Intuitively speaking, we can say that under the regularity condition of technological progress, the falling international coordination costs improves the M-firm's competitiveness over the rival firms. That is, it increases the productivity of the northern skilled labor and the southern unskilled labor of the M-firm. The lower costs of international coordination lower the relative price of the M inputs. This result allows the M-firm to take over the production of some inputs that are previously produced by other firms. That is, it leads to an expansion of offshoring or international fragmentation.

CONCLUSION

In this paper, we have constructed a model for studying the effects of falling international coordination costs on the wage inequality and offshoring. In our model, offshoring firms formulate international team, in which the northern managers supervise the southern workers, and thus require international coordination. For the production of intermediate inputs, offshoring firms choose to offshore the production plant activities to the low-wage south and remain the headquarter services in the north. We show that the production of intermediate inputs is shared among firms in the north and the south: the high-tech intermediate inputs are produced by the northern firms in the north, the medium-tech intermediate inputs are produced by the offshoring firms, whereby the skilled parts are produced in the north and the unskilled parts are produced in the south, and the low-tech intermediate inputs are produced by the southern firms in the south.

In our model, a fall in international coordination costs lowers the relative skilled wage in the south, but raises that in the north. That is, it narrows wage inequality between managers and workers in the south, but widens that in the north. Our model also shows the impacts of falling international coordination costs on offshoring. Under the regularity condition of technological progress, we can say that a fall in international coordination costs improves the competitiveness of offshoring firms by lowering the relative price of intermediate inputs that they produce, which in turn stretches the borderlines of offshoring. As a consequence, the falling international coordination costs leads to an expansion of offshoring or international fragmentation.

CHSF AND ENGLISH LANGUAGE: A COMPETITIVE ADVANTAGE STRATEGY IN THE HOSPITALITY/TOURISM INDUSTRY

Cristina G. Gallato, Universiti Utara Malaysia
Kristy Aileen G. Gallato-Reamillo, Saint Mary's University

ABSTRACT

This paper addresses two issues of competitive advantage: 1) a clean, healthy, safe and friendly environment (CHSF), and 2) language barriers. Cleaning and greening the environment has become a very urgent world concern due to pollution, which was a setback of industrialization. Due to pollution, a person's basic needs for survival which are air, water, food and shelter have been put at great risks. These basic needs are the concerns of business. Thus, the need to protect the environment can be a competitive advantage strategy for business firms in general, and for the Hospitality/Tourism industry in particular. In terms of language barriers, English plays an important role. Travelers/tourists sometimes prefer to visit a country where communication is not a problem. A home/hotel/restaurant/tourist spot/school/office/village/nation that is clean/healthy to live in, safe/friendly have always that charm of enticing visitors/guests to come back. Guests that keep on coming back implies repeat business which ultimately would add figures into the bottom-line. The CHSF Program addresses these two issues: sanitation and safety of the environment and language barriers issues. It is a green program and a strategy that helps build a competitive advantage especially when sanitation and safety and language barriers issues are at stake.

BEHAVIORAL MODELING OF TIME, TREND AND TRADING OF FIIS IN INDIAN EQUITY MARKET

Santosh Kumar, Amity University
Raju G, Galgotias College of Engineering and technology
Japnit Walia, Amity University
Tavishi, Amity University

ABSTRACT

In the last ten years the FII flows have increased almost twenty times and attained thirteen and six percent in National Stock Exchange and Bombay Stock Exchange respectively in cash segment of Indian equity market raising the issue of behavioral modeling of time, trend and trading of FII flows with respect to local and global stress in market. In this context, the present study empirically documents the static and dynamic interaction between FII flows and stock market return using daily data for both the variables from 2000 to 2009 using Regression (OLS) and Vector Auto Regression along with Impulse Response Function. The regression results indicate the strong evidence of positive feedback trading of FIIs with adjusted R square of eleven per cent. Further, the Granger Causality test leads to the rejection of both the null hypothesis lending strong support to bi-directional relationship among FII flows and equity return of Indian stock market. However, the overall response function of institutional investors to one S.E shock reveal very sharp and significant impact dying out in four to five days. Thus the paper recommends active and informed churning strategies of portfolio managers and investors dealing with firms of higher FII contribution.

KEY WORDS Positive Feedback, FII, Granger Causality, VAR, Market Return, Impulse Response Function

INTRODUCTION

The Government of India allowed Foreign Institutional Investors to Invest in stock market in September 1992, which lead to the integration our economy with global financial markets. Since then, FII flows seem to exhibit four different structural periods with widely different characteristics in quantum and momentum. The institutional investors changed their momentum drastically at three different years viz. 1997 (Asian crisis), 2004 (Election and formation of UPA Government), 2008 (Lehman Brothers crisis and Satyam debacle). Initially it seemed that FIIs are speculators and tend to make money in short span whereas of late they are net buyers in spite of mutual funds being net seller. Thus the prime facie facts lead to a mixed observation.

REVIEW OF LITERATURE

Trivedi and Nair (2000) find that the return and volatility in the Indian market are primary determinant of FII flows. Analyzing monthly data from May 1993 to December 1999, Chakrabarti (2001) find that the FII net flows are more likely to effect than the cause of equity market returns, with the FIIs not having informational disadvantages compared to domestic investors. Using the data between January 1999 and May 2002, Mukherjee et al. (2002) find that FII activities have a strong demonstration effect and are driving the domestic market suggesting that the FIIs flows tend to be caused by return in the domestic market. Batra (2003) use the daily and monthly data of FII and market return from 2000 to 2002 and find the strong evidence that FIIs have been positive feedback investors and trend chasers at aggregate level on a daily basis. However there are no positive feedback chasers on monthly basis. Babu and Prabheesh

(2008) examine the dynamic interaction between FII flows and stock market returns using daily data from 2003 to 2007. They find the existence of bidirectional causality between FII flows and stock returns. They also find support for information revelation hypothesis and momentum trading hypothesis. Prasanna (2008) examine the investment preferences of FII in India and find that FII invest more in companies with a higher volume of shares owned by the general public. Further he also concludes that share return and EPS are the crucial factors in determining the investment of FII. Among external factors, LIBOR and emerging market stock returns are important, while the primary domestic determinants are the lagged stock return and changes in credit ratings.

Dornbusch and Park (1995) argue that foreign investors pursue positive feedback trading strategies that make shocks overreact to changes in fundamentals. Warther (1995) document that unexpected shocks to mutual fund flows in U.S have a strongly positive contemporaneous effect on returns, in line with the findings of Clark and Berko (1997) who report positive significant relation between concurrent returns and foreign equity purchases using monthly data in Mexico. Choe, Kho and Stulz (1998) also examine the impact of foreign investors on stock returns in Korea before and after the 1997 using daily data. They find the evidence of positive feedback trading before the Asian crisis. Froot et al. (2001) find that the international capital inflows predict or lead price changes. Giffin et al. (2002) use a theoretical model and empirical analysis to show that return performance is an important factor in understanding equity flows. Richards (2002) using daily data for daily net purchases by foreigners in six Asian emerging equity markets over 1999-2001 gives strong evidence of positive feedback trading with respect to domestic, US and regional equity returns. Thus there are mixed results in Indian context. Some of the earlier studies strongly lend support to the positive feedback trading whereas few studies accept it as a result of spurious correlation or the case of omitted variables.

Thus, a large number of studies favour the prevalence of positive feedback trading in various stock markets across the globe. Some studies deny its existence. Under this backdrop, the present study is an attempt to examine the static and dynamic relation between FII and stock return in Indian context. To be more specific, the basic objectives of the study are summarized as follows.

- I. To study the direction of relationship between FII and market return.
- II. In the case of interdependence do the FII flows dynamically relate to the lagged values of market return and vice versa?
- III. To empirically examine whether the unexpected component of FII is attributed to market return.
- IV. Does the positive feedback trading hypothesis exist in the Indian stock market?

DATABASE

The aggregate daily FII data comprising three components purchases, sales and net purchases (purchases less sales) have been obtained from 7th January 2000 to 6th August 2009 from the monthly bulletin of Money Control. The net FII purchases (purchases less sales) have been normalized by market capitalization at time t (Goetzmann & Massa, 2003). We have frequently used five notations relating to FII viz. FIIP, FIIS, NFIIPT, FIIPPT and UFIIPT referring to FII purchases, FII sales, net FII purchases, net normalized FII purchases, and unexpected net normalized FII purchases respectively. The UFIIPT series is generated by subtracting estimated FIIPPT from actual FIIPPT.

The data on the market index (S&P CNX Nifty) is collected from the official website of National Stock Exchange. Days when there is no trading are omitted and the price change is computed from the last day the market was open. The returns for market are taken by the log difference in the price index.

$$RT = \text{Log}P_t - \text{Log}P_{t-1}$$

RT is the return of the market (S&P CNX Nifty) at time t.

P_t and P_{t-1} indicate the market's index at the end of day t and $t-1$ respectively.

Similarly RTP and RTF are the returns in the previous period ($t-1$) and following period ($t+1$) respectively.

The whole study is undertaken using daily data. Daily data give more precise results and are able to capture the lead lag dynamics between FII and market return.

METHODOLOGY

To carry out the in depth analysis between FII and market return the whole study is accomplished in four stages as follows.

Static Analysis

As a first step to explore the direction of relationship between FIIP and market return we perform Granger Causality test to eliminate the simultaneity bias in the bivariate model. By this we specify the channels of causality using the standard "identification by ordering" methodology. The channel of causality is established from the results of Granger Causality test (Granger, 1969). Then we also check the stationary of variables by Augmented Dickey Fuller test and Phillips Perron test to estimate the bivariate model under OLS assumption.

Dynamic Analysis

Further in order to capture the dynamic interaction between market return and FIIP flows we use unrestricted Vector Auto Regression (VAR) without any restrictions on the structure of the system as below;

$$\begin{aligned} \text{FIIP}_t &= \text{FIIP}_{t-1} + \text{FIIP}_{t-2} + \dots + \text{FIIP}_{t-n} + R_{t-1} + R_{t-2} + \dots + R_{t-n} + \epsilon_1 \\ R_t &= R_{t-1} + R_{t-2} + \dots + R_{t-n} + \text{FIIP}_{t-1} + \text{FIIP}_{t-2} + \dots + \text{FIIP}_{t-n} + \epsilon_2 \end{aligned}$$

Where, FIIP_t is the net normalized FII purchases at time t .

We use VAR to quantify the impact of innovations (ϵ_1, ϵ_2) in returns by net FII purchases and vice versa. In addition we also generate Impulse Response Function to trace the time path of the shocks on the variables contained in the VAR and finally identify the appropriate lag length using the AIC and SBC criterion.

(1) Decomposition of FII Flows

To explore the bivariate model further we separate the flows into expected and unexpected components and investigate the regression results of both the components with market return Clark and Berko (1997).

(2) Test of Positive Feedback Trading Hypothesis

The positive feedback trading hypothesis describes the strategy of rushing in when the markets are booming and rushing out when the markets are on the decline. Thus it expects a positive relationship between current FII investment and the past performance of the market. For estimation, we examine the following regression.

$$\text{FIIP}_t = \beta R_{t-1} + C$$

Where, $FIIPT_t$ is net normalized FII purchases at time t . It is calculated by dividing net FIIP at time t by the market capitalization at $t-1$.

β is regression coefficient and R_{t-1} is the return in the previous period.
 $\beta > 0$ indicates positive feedback trading.

RESULTS AND DISCUSSION

Table 1 and 2 show the descriptive statistics and the autocorrelation (AC) and partial autocorrelation (PAC) at different lags respectively for various components of FII. The results of autocorrelation matrix reveal that the various components of FII have very high correlation at lag 1 but lower correlation at higher lags indicating the daily FII investments are independent of its distant lagged values. There is clear indication that FII pattern is short lived and persists for very short duration. Further we check the order of integration of the variables using unit root test based on Augmented Dickey Fuller Test and Phillips Perron test (Phillips and Perron, 1988). The results (Table 3) show that all the components of FIIs are stationary at levels indicating the absence of trend and the long term mean reversion. From the Jarque – Bera statistics we may also infer that the various components of FII are unlikely to have been drawn from a normal distribution. The standard deviation in FII, which is indicative of unconditional variance in FII, however continues to remain almost at high level for all the components of FIIs.

Table 1: Descriptive Statistics

Variable	Observation	Mean	median	S.D	J.B	
					t-statistics	p value
FIIP	2338	1278.5	732.1	1396.06	4235.1	0.00
FIIS	2338	1180.7	583.5	1353.9	4225.7	0.00
NFIIP	2338	97.64	51.90	554.5	39986.5	0.00
FIIPT	2338	0.011	0.008	0.038	46945.9	0.00

Table 2: Autocorrelation Matrix at Different Lags

Variable	Statistics	length of lag		
		1	3	5
FIIP	AC	0.827	0.784	0.794
	PAC	0.827	0.216	0.141
FIIS	AC	0.867	0.816	0.814
	PAC	0.867	0.199	0.137
NFIIP	AC	0.326	0.227	0.190
	PAC	0.326	0.127	0.060
FIIPT	AC	0.291	0.222	0.151
	PAC	0.291	0.138	0.040

Table 3: Test of Stationary Series (Unit Root)

Particular	Unit Root Tests				Inference
	Augmented Dickey Fuller Test		Phillips Perron Test		
	Test Statistic	Critical value (5%)	Test Statistic	Critical value (5%)	
FIIP	-4.73	-2.78	-13.80	-2.86	Rejected
FHIS	-4.78	-2.78	-11.14	-2.86	Rejected
NFIIP	-14.01	-2.78	-37.67	-2.86	Rejected
FIIPT	-14.78	-2.78	-38.84	-2.86	Rejected

Table 5 shows the Vector Auto Regression (VAR) results of the FIIPT and RT and the UFIIPT and RT. The VAR analysis is undertaken with different lag lengths and the appropriate lag 6 is selected on the basis of AIC and SBC results. The FIIPT and UFIIPT regression equations show that they are significantly correlated to their own lagged values up to four days where they have also significant relation with lagged daily returns up to three lags.

These results lend support to positive feedback hypothesis in Indian context. The graphs for the impulse response function are also generated by VAR model and depicted in Figure 1. The response of FIIPT and UFIIPT to one S.E shock to lagged return is sharp and significant for a very short period. However the impact remains intact for a prolonged duration with lesser fluctuations. It may be attributed to some unknown macroeconomic factors or some hidden information apart from lagged returns. The results of VAR model further support our conclusion from static estimation. We further test the direction of causality between stock return and FIIPT using Granger causality test.

Results in Table 4 show that the null hypothesis “RTP does not Granger cause FIIPT” is rejected and the null hypothesis “FIIPT does not Granger cause RTF” is rejected as well. This is a clear indication of bidirectional causality between stock return and FIIPT. This also reveals that Foreign Institutional Investors are well informed compared to retail investors and their buying and selling activity decides the direction of market. This is in consistent with the previous study by Babu and Prabheesh (2008) who examined the dynamic interaction between FII flows and stock market returns using daily data from 2003 to 2007. They found the existence of bidirectional causality between FII flows and stock returns and adequate symptom of momentum trading hypothesis.

Table 4: Granger Causality Test

Pair wise Granger Causality Tests (2 Lags)			
Null Hypothesis:	Obs	F-Statistic	Probability
FIIPT does not Granger Cause RTF	2336	116.358	0.00000
RTP does not Granger Cause FIIPT	2336	37.7243	0.00000

Table 6 present the regression results of FIIPT and UFIIPT with current and lagged daily return. The results show the positive and significant coefficient of lagged return with FIIPT and UFIIPT. It is prime facie evidence that FIIs have been positive feedback traders at aggregate flows. The similarity of regression results using FIIPT and UFIIPT as dependent variable may be on account of significant role of unexpected component (adjusted R square is 0.11) in both the series. The higher value of unexplained variation in regression results is in consonance with the findings of Prasanna (2008) who concludes that in determining the investment of FII, there are several external factors like LIBOR, emerging market stock returns and changes in credit ratings.

Figure 1: Response to a Shock to Daily Return

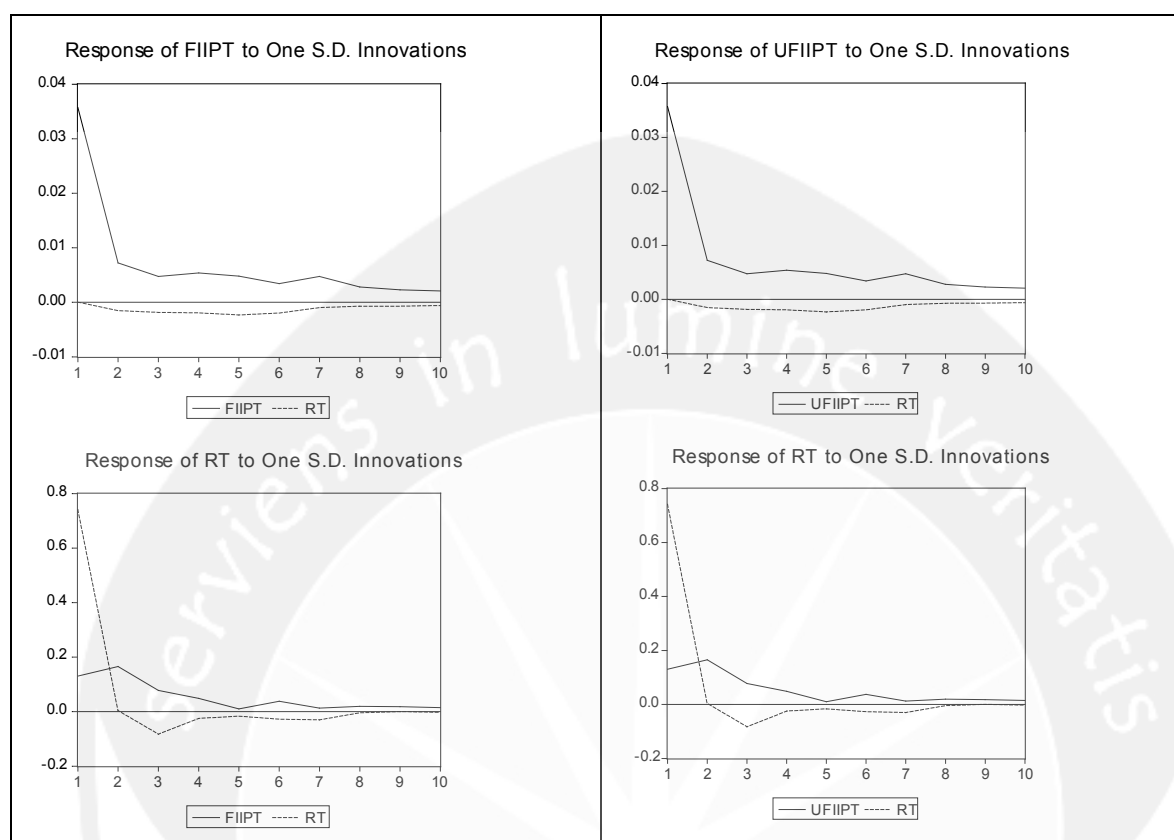

Table 6: Regression Statistics

Regression of Dependent	Independent Variable	Coefficient	Prob.
FIIPT	C	0.010734	0.0000
	RT	0.010668	0.0000
	RTP	0.011622	0.0000
	Adjusted R-squared	0.114059	0.000000
UFIIPT	C	-0.000440	0.5578
	RT	0.010634	0.0000
	RTP	0.011617	0.0000
	Adjusted R-squared	0.113622	0.000000
RT	C	-0.035504	0.0305
	FIIPT	4.884100	0.0000
	Adjusted R-squared	0.057228	0.000000

From the static regression results it is evident that unexpected FII flows play a major role indicating that FII traders are positive feedback traders.

MAIN FINDINGS AND CONCLUSION

The empirical investigation of FII flows to India has elicited the following ‘stylized facts’ about the flows.

- FII flows are significantly correlated to its own lagged values and lagged return as well.

- b) The response of FII flows to one S.E shock to lagged return is sharp and significant for a very short period.
- c) There is bidirectional relationship between FII flows and return with the fact that FII granger causes return and vice versa.
- d) There is strong evidence of positive feedback trading.

In this study we analyze the static and dynamic relationship between FII flows and stock market in Indian context. The above results are predominantly more important for investors because the quantum of FII inflows have substantially changed in the last decade due to liberalization and have influenced the stock market. Results substantially show that the FII traders have their own fashion of investment and normally their trend persist for a short duration. Further it also leads to the conclusion that the FII traders are rushing into the market when the market shows a bullish trend and rushing out of the market in bearish phase.

PROFILING AND THE STUDENT PROJECT PEER APPRAISAL PROCESS

Rodley C. Pineda, Tennessee Technological University
Bonita B. Barger, Tennessee Technological University
Linda D. Lerner, Tennessee Technological University

ABSTRACT

Past research on team formation and composition reveals that team member attributes play a role in how students perceive each others' contributions to a team project. Can attribute-based profiling be used during the peer appraisal process so that a holistic-based assessment tool can still provide meaningful feedback to the student being rated? Our study shows that students can develop a profile of the "ideal team member" at the start of the project that is consistent with their overall assessment of a team member's performance at the end of the process.

INTRODUCTION

The use of group projects in higher education has grown progressively over the years, ostensibly due to the fact that employers view the ability to work effectively in a team as an essential skill (Holt, et al., 1997). Guzzo and Dickson (1996) stated that one of the ways in which educators assess the effectiveness of student project teams is when the students' experiences provide developmental outcomes for those involved. According to Hartenian (2003), team training and experiences positively correlate with team knowledge, skills and abilities. The opportunity for students to get feedback about their performance in these project teams, therefore, is an essential part of the learning process.

Feedback about individual student performance in teams is often obtained from peer assessments since direct observation by the instructor is usually not feasible. Several studies have shown that given the choice, students prefer to rate their peers using a holistic approach that provides a "big picture" view of their satisfaction with their peers' contribution to the overall team experience and outcome. A category-based peer appraisal approach, however, can provide more meaningful feedback on a student's teamwork knowledge, skills and abilities for developmental purposes. This latter approach, that asks students to evaluate their peers on several criteria at the end of the project, however, have been found to result in lower motivation among students to take the peer appraisal process seriously. This category-based approach is also more difficult when a student's performance within the group is part of the grading process for the course.

This paper will show that a peer appraisal process that asks students to develop an attribute profile of their ideal team member at the beginning of the project can be used to provide feedback about the teamwork skills and abilities of students who receive poor and excellent holistic ratings at the end of the project. The benefits and limitations of this profile-based peer appraisal approach are then discussed.

THE PEER APPRAISAL PROCESS IN STUDENT PROJECT TEAMS

A peer appraisal process is often considered as an integral part of student team projects since team members are more privy to the inner workings of the group compared to an external observer (Russell, et al., 2006). The assessment of individual team member contributions has a practical value to the instructor since it is used as reference when determining the students' grades on the project. But students have reported that the use of peer appraisal also encourages team cooperation, commitment and increased

engagement among team members (Willey & Gardner, 2009). These outcomes are critical since social loafing can lead to lower student satisfaction with the teamwork experience (Schultz, et al., 2010).

There are two common formats generally used to assess team member contributions. A holistic-based approach lets a student give an overall appraisal of a team member's performance. This method is most convenient when used as basis for assigning an individual grade for the student's contribution to the project. A category-based approach, on the other hand, affords a student the opportunity to rate a team member on several criteria that are deemed as important for effective teamwork.

The category format has been found to improve team member performance (Erez & Somech, 1996), increase commitment (Willey & Gardner, 2009) and reduce social loafing (Brooks & Ammons, 2003). Lejk and Wyvill (2001) suggested that a category-based assessment process is useful in generating feedback about teamwork skills for developmental purposes.

Friedman, Cox and Maher (2008) found, however, that students prefer the holistic-based approach over the category-based approach. They concluded that an overall rating of team members at the end of the project gives the rater more flexibility in distributing a team member's contribution to those criteria that they considered as relevant. The students' higher motivation to rate holistically can also be driven by the convenience of a shorter assessment form, especially when done toward the end of the term.

Russell, Haritos and Combes (2006) suggested that there is a need to establish clear evaluation criteria that can guide student appraisers even if a holistic approach to assessment is used. If evaluation criteria are an essential part of an effective peer appraisal process, can it be used to interpret the holistic assessments provided by team members at the end of the project? Such an assessment process can, thus, incorporate the developmental benefits of a category-based format and the practical advantages of a holistic approach.

A PROFILE-BASED APPROACH TO PEER APPRAISAL

This study tested an assessment method that combines category- and holistic-based approaches to student team peer appraisal. The method employs a two-stage process that first asks students for the attributes of their most ideal team member from a list provided by the instructor at the start of the project. The student is then told to provide a holistic rating of his or her team members according to their contributions to the project at the end of the term. Allowing students to establish a profile of an ideal member sets the stage for interpreting the holistic ratings they give to their teammates at the end of the project. An instructor-guided but student-defined profile is also beneficial if they are to take this assessment seriously (Goode & Teh, 2005). Having students develop the profile at the start of the project process and holistic ratings at the end also optimizes the rise and fall of student motivation levels during the project process as discovered by Friedman, Cox and Maher (2008).

The attributes used during the first stage of the process are derived from the list developed by Connerley and Mael (2001). Their study tested fifty-one team member attributes that could matter to students when selecting and assessing team members. The thirty attributes that are included in the list provided to the students are those that were found to be significantly correlated with student satisfaction with a team member. These attributes are also deemed by the instructors as relevant to the context of their courses. The attributes represent five conceptually-defined dimensions: academic attitudes, abilities and relevant experience, intrapersonal temperament, interpersonal and work preferences (refer to Table 1).

Table 1: Attributes and Dimensions

Dimension	Attributes
Academic attitudes	Importance placed on team assignment Attitude toward school in general Attitude toward this class Attitude toward hard work Importance placed on grades Desired grade in class
Ability and relevant experience	Ability to express written thoughts Ability to communicate orally Resourcefulness Ability to brainstorm Experience conducting research Creativity Writing skills Fluency in English Previous team experience
Intrapersonal temperament	Dependability to show up at meetings Ability to be self-motivated Friendliness Ability to work under pressure Sense of responsibility Attitude toward early versus last minute
Interpersonal	Ability to work well in groups Ability to get along with others Attitude toward carrying own workload Ability to compromise Personality (shy or outgoing?) Desire to voice opinion in group
Work preference	Ability to work late nights with group Willingness to work weekends

Students are asked to specify the importance of each of these attributes to their profile of an ideal team member before they actually select team members. Levine and Moreland (1990) suggested that students selecting their own teams often choose team members based on friendships and convenience. Letting students develop a profile before they select team members can reduce the chance that the criteria they select will be tailor-fitted to the composition of their team. Tailoring the profile to selected teammates can eliminate potential feedback on deleted attributes that could otherwise be essential for an “ideal team member.”

The students are then asked to rank team members according to their contributions to the project. It is expected that the students will use the profile they developed during the first stage when ranking their team members at the end of the project. The holistic-based ranking can then be interpreted in light of the profile developed by each rater. Each student can then receive feedback on their performance in each criterion without having students rate each other on each attribute at the end of the project when their low motivation to do so could render their assessment meaningless.

METHODOLOGY AND RESULTS

To test the validity of this approach, the authors modified the second stage of the process by asking the students to rate their team members along the same attributes as those presented at the start of the project. Those team members that were adjudged to have contributed the most to the project should score highly on attributes that were deemed to have the largest positive impact on team performance. Those who were deemed to have contributed the least should score poorly on the same attributes.

Our sample consisted of 187 junior and senior-level college students at a mid-sized regional university. The students were enrolled in either one of two different courses that each required a semester-long team project. Students formed their teams made up of three to five members each.

Data were collected in two stages. During the first stage, each student was asked to express his or her opinion on the extent to which thirty attributes of their *ideal* team member should contribute to team performance (-2 = very negative contribution, -1 = negative contribution, 0 = no contribution, 1 = positive contribution, 2 = very positive contribution). This survey was administered before students formed their teams. To match their responses with those taken during the second stage of data collection, students were asked to provide identification codes. The second stage of data collection consisted of a survey that was administered after completion of the project and before the project grades were released. Each respondent was asked to evaluate the contribution of the team member who contributed the *most* and who contributed the *least* along the same thirty attributes using the same scale as the first survey. Respondents did not have access to their responses collected at stage one. Their responses were then matched with those from the first stage using the identification code provided earlier. Item means were calculated for each attribute and compared across the two stages of data collection. Table 2 shows the mean responses to each attribute as it relates to the team member that contributed

Table 2: Sample Means of Attributes of Least Contributor, Ideal Team Member and Most Contributor

Attribute of a team member	Mean response about the team member who contributed the least to the project	Mean response about the ideal team member	Mean response about the team member who contributed the most to the project
Academic attitudes			
Major	0.64	0.34	1.20
Importance placed on team assignment	0.65	1.13	1.60
Attitude toward school in general	0.56	0.88	1.38
Attitude toward this class	0.49	0.89	1.34
Attitude toward hard work	0.65	1.34	1.62
Importance placed on grades	0.67	1.22	1.61
Desired grade in class	0.80	1.50	1.65
Ability and relevant experience			
Ability to express written thoughts	0.57	1.35	1.64
Ability to communicate orally	0.72	1.58	1.72
Resourcefulness	0.57	1.42	1.57
Ability to brainstorm	0.75	1.32	1.51
Experience conducting research	0.68	1.00	1.45
Creativity	0.61	1.08	1.47
Writing skills	0.45	1.01	1.58
Fluency in English	1.25	1.21	1.84
Previous team experience	0.80	0.64	1.48
Intrapersonal temperament			
Dependability to show up at meetings	0.74	1.74	1.76
Ability to be self-motivated	0.65	1.36	1.67
Friendliness	1.23	1.05	1.69
Ability to work under pressure	0.71	1.20	1.62
Sense of responsibility	0.59	1.49	1.70
Attitude toward early versus last minute	0.53	1.04	1.37
Interpersonal			
Ability to work well in groups	0.95	1.56	1.68
Ability to get along with others	1.21	1.34	1.77
Attitude toward carrying own workload	0.56	1.29	1.72
Ability to compromise	1.00	1.21	1.50
Personality (shy or outgoing?)	0.90	0.63	1.48
Desire to voice opinion in group	0.82	0.99	1.67
Ability to work late nights with group	0.59	0.72	1.33
Willingness to work weekends	0.62	0.62	1.30

the *least* to the project, the *ideal* team member, and the member that contributed the *most*, respectively. These results suggest that as a group, students in our sample gave those they deemed to have contributed the *most* with higher ratings than their *ideal* team member along all team member attributes while giving lower ratings to those who they perceived to have contributed the *least* along 24 of the 30 attributes. The only attributes where this pattern did not occur are those related to the team member's *Major*, *Fluency in English*, *Previous team experience*, *Friendliness*, *Personality*, and *Willingness to work weekends*. It is noteworthy that except for *Friendliness*, these attributes have low mean values in the profile of the ideal team member.

These differences exist between the sample means among the three types of team members but, more importantly, are these differences significant within-subjects? Each student's response as to how his or her ideal team member fit a particular attribute and how the member who contributed the most to the project scored on each attribute were tested for any significant differences. There were significant within-subject differences at the .05 level for all attributes except one: *Dependability to show up at meetings*.

When differences within-subjects were tested between ideal team member attributes and those related to the member who contributed the least, the differences on four of the 30 attributes were not significant at the .05 level: *Fluency in English*, *Desire to voice opinion in group*, *Ability to work late nights with group*, and *Willingness to work weekends*. The ideal team member profile listed the last three attributes as having low mean values.

CONCLUSION

The findings suggest that this profile-based assessment method can be used to provide feedback to students. The proposed method is user-friendly since it takes advantage of the students' propensity to develop a profile of the ideal team member at the earliest stage of the team project process to complement a more convenient and course grade-friendly holistic-based peer assessment at the end of the process. The consistency with which students rate their peers along attributes that are considered as important attests to the validity of this two-stage assessment process.

There are limitations, however, to this method. First, the method is subject to one of the weaknesses of any holistic-based approach – it is most useful at distinguishing between poor and excellent performers. It is less robust when assessing average performers whose ratings across attributes may have subtle variations. Second, an assessment process that allows for open-ended comments about team members may provide richer feedback information. But this is still subject to the willingness of students to engage in this labor-intensive activity. At the very least, the peer assessment method proposed in this paper can be used to supplement any comments provided by students and ensure a more comprehensive alternative to a sentence or two about a student's team work abilities.

ENHANCING STUDENT SATISFACTION WITH HIGHER EDUCATION SERVICES: GOING BEYOND SERVICE QUALITY PERSPECTIVES

Jungki Lee, Korea University at Sejong

ABSTRACT

Students are known to experience significant amounts of stress and challenges during their academic pursuit at college. This study explores a way to enhance student satisfaction by incorporating a concept called perceived control to the existing service quality model. To be specific, this study proposes and tests that perceived control could be a promising factor which may enhance service quality, satisfaction, and recommendation intention among college students. A set of three hypotheses developed for this study were partially supported.

KEYWORDS: services marketing, perceived control, service quality, and student satisfaction

INTRODUCTION

Maintaining a high level of service quality and customer satisfaction at a higher education institution is very difficult. The customers (i.e., students) are facing challenges from many different sources in their college lives: academic, social, interpersonal, financial, among others. If these stressors are not dealt with effectively, negative consequences such as feelings of loneliness, nervousness, sleeplessness and excessive worrying may result (Wright 1967). If one was under stress, it would be fairly difficult to experience satisfaction in that environment. Ross, Niebling, and Heckert (1999, p. 312) have argued that “it is important that stress intervention programs be designed to address stress of college students.”

Regardless of the pervasiveness of stress among college students, the literature on student satisfaction has paid limited attention to the stress. Studies on student satisfaction are mostly based upon the service quality paradigm. Many scholars, for example, have adopted either the SERVQUAL or SERVPERF perspective, and have tried to approach student satisfaction by enhancing the so-called five dimensions of service quality: tangibles, reliability, responsiveness, assurance, and empathy (Cronin and Taylor, 1993; Parasuraman et al., 1985). Albeit useful, the limitations of such approach are many (Buttle, 1996).

The purpose of this study is to explore a way to enhance student satisfaction by incorporating a concept called perceived control to the existing service quality model. To be specific, this study proposes that perceived control could be a promising variable which would enhance service quality, satisfaction, and recommendation intention among college students.

LITERATURE REVIEW

Service Quality

Service quality is an elusive concept, and there has been a considerable amount of disagreements in literature about how best to conceptualize the construct. Parasuraman et al. (1985; 1988) proposed a gap model which posits that service quality is determined by the discrepancy of expected performance and perceived performance of a service provider. They proposed a multiple-item scale, called SERVQUAL which posits that service quality can be assessed by five dimensions: tangibles, reliability, responsiveness, assurance, and empathy. Parasuraman et al. (1988) maintained that the 22-item scale and its five dimensions are reliable and valid in measuring service quality. SERVQUAL has been adopted and

applied by many scholars. At the same time, the SERVQUAL scale has been criticized by many and the most notable challenge was made by Cronin and Taylor (1992). They proposed a “performance-based” service quality approach called SERVPERF by noting that a customer’s perception of service quality is based upon his/her “perceived” attitude about the service.

The importance of service quality has been recognized in the field of higher education settings as well. A direct application of the service quality approach developed in other sectors to higher education contexts, however, may warrant some cautions. Customers of colleges (i.e., students) are different from customers of conventional service customers because they are customers in subordinate roles (Lee, 2010) who have a higher likelihood to experience stress and frustration. Considering such a propensity to experience negative emotions among students, there is a surprising paucity in literature on education service quality dealing with students stress. The concept of perceived control discussed below has a high potential to incorporate that issue.

Perceived Control

The concept of perceived control has been studied in psychology in conjunction with an individual’s interaction with his/her surroundings. Personal control has been defined as one’s perceived competence, superiority, and mastery over an environment (White, 1959). Perceived control is known to have the crucial role in determining negative consequences such as stress, helplessness, and meaninglessness, as well as positive consequences such as self-efficacy, competence, well-being and satisfaction. Averill (1973) offered a typology of personal control: behavioral, cognitive, and decisional controls.

Behavioral control is the most widely accepted conceptualization of perceived control, representing one’s belief of his/her ability to change the objective nature of an impending event. A group of researchers demonstrated that an individual’s perception of control over a situation is largely affected by his/her belief regarding the ability to modify the objective nature of the situation (Litt, 1988; Thompson, 1981). In essence, they suggest that an individual’s perception of behavioral control reduces his/her perceived risk and stress in an environment. Second, the theory of cognitive control is built upon one’s ability to subjectively incorporate the stressful event into one’s cognitive plan. According to Averill (1973), a person would perceive less stress in dealing with a potentially stressful event when s/he is provided with sufficient information about the nature of that event in advance. Finally, the theory of decisional control is founded upon a premise that human actions are goal-directed and therefore, an individual may perceive that s/he is in charge of a situation when s/he believes that s/he will eventually obtain a personally desirable outcome from that situation. Scholars founded upon action-theoretical perspectives noted that individuals perceive less stress in dealing with a potentially stressful event when they believe that they may gain personally desirable outcomes through their interactions with that event (Kelley, 1955; Skinner, Chapman, and Baltes, 1988).

In summary, a person facing a potentially stressful event may find the situation less stressful when s/he perceives control in that environment. This study applies the perspective of personal control to the higher education setting and posits that the stress-reducing effects and satisfaction-enhancing effects of perceived control can also be observed among college students.

HYPOTHESES

For a robust test of theory, this study adopts a macro perspective by incorporating a set of perceived control variables (behavioral control, cognitive control, and decisional control) into conventional SERVQUAL variables (tangibles, reliability, responsiveness, assurance, and empathy) to empirically test if the addition of those perceived control variables would enhance college students’ evaluation of their colleges. First, behavioral control is likely to affect the student’s evaluation of their colleges. Compared

to a program where students feel that they have no choice in their academic life but have to uniformly follow school-required procedures, a program that allows students to make choices with regard to their academic life (*i.e.*, behavioral control) is likely to foster a high level of student satisfaction. Second, students are likely to evaluate their college more favorably when the school provides them with sufficient information about the program, courses, requirements, and so on. Being fully informed about the nature of school life and specific aspects of the academic requirements (*i.e.*, cognitive control), students may be able to include possible future academic and non-academic challenges in their cognitive plan. Finally, students are likely to evaluate their school more positively when they believe that they will obtain the desired benefits from the program in the long run. When a student believes that s/he will eventually obtain desirable outcomes from their college (*i.e.*, decisional control), the student is likely to deal with academic challenges with less stress and frustration and retain high hopes, which would make him/her evaluate the school more favorably. Based upon this reasoning, the following set of hypotheses was developed to test the effects of perceived control on program evaluation among college students.

H1^{a, b, c}. Perception of behavioral control has positive influence on perceived quality^a, satisfaction^b, and recommendation intention^c of education service among college students.

H2^{a, b, c}. Perception of cognitive control has positive influence on perceived quality^a, satisfaction^b, and recommendation intention^c of education service among college students.

H3^{a, b, c}. Perception of decisional control has positive influence on perceived quality^a, satisfaction^b, and recommendation intention^c of education service among college students.

METHODS

Data for this study were collected via a self-reported questionnaire administered to 155 students enrolled at a major college in South Korea. The questionnaire was composed of four sections: SERVPERF measures, perceived control measures, dependent measures (*i.e.*, service quality, satisfaction, and recommendation intention), and demographic questions.

A total of 131 useable responses were collected. Demographically, 45 percent of the respondents were female and 55 percent male. Almost all of them (99%) were in their twenties. As far as academic standings were concerned, about 92 percent of the students had cumulative GPA of 3.0 or above, and about 80 percent of them between 3.0 and 3.9. A review of demographic characteristics of the sample made by two college administrators confirmed that the sample represented the entire student population enrolled at the school appropriately.

RESULTS

Measurement properties of the scales developed for this study were evaluated using reliability, convergent validity, and nomological validity. The five scales regarding service quality, in general, had acceptable reliability. The scales of tangibles, reliability, responsiveness, assurance, and empathy had reliability coefficients of .68, .76, .77, .75, and .75 respectively. The scales of perceived control also had high levels of reliability. The scales of cognitive control, behavioral control, and decisional control had cronbach alpha coefficients of .79, .81, and .81, respectively. All items of each construct had significant factor loadings greater than .2, thus providing evidence of significant convergent validity (Anderson and Gerbing, 1988). Constructs used in this study were found to behave consistently with pertinent theories in both marketing and psychology, as evidenced by the significant correlations among service quality constructs and among perceived control constructs. In summary, the measures used in this study were found to have adequate measurement properties for a theory testing.

Hypotheses were tested by using a series of regression analyses. The results of the hypothesis test are presented in Table 1.

Table 1: Effects of SERVPERF and Perceived Control on Dependent Measures

Independent Variables		Service Quality (H1)	Satisfaction (H2)	Recommendation Intention (H3)
SERVPERF				
Tangibles	.012	.090	.297	
Reliability	.287*	.078	.101	
Responsiveness	.079	.059	.178

Decisional Control	.215*	.147	.295*	
Adjusted R ²		.178	.268	.289

*: Significant at .01

DISCUSSION and CONCLUSIONS

Findings in this study offer several insights into understanding the influence of perceived control on students' evaluation of education services rendered at higher education institutions. One of the most notable findings of this study is that perceived control variables indeed exert meaningful influences on students' evaluation of college services. Students in general were found to prefer having control over their school lives. Specifically, students want to have the ability to make influences on their academic and non-academic school lives. In addition, they prefer to have confidence that the school will offer them personally desirable outcomes.

First, colleges should establish program diversity for their students. A college would be highly appreciated when its programs accommodate an individual's preferences and allow its students to design their course of academic and nonacademic pursuits. In addition, colleges should inform their students that they are allowed and encouraged to make suggestions that would possibly change their academic and non-academic environments. Most of all, colleges should be able to instill confidence among their students in terms of the desirability of their efforts at the college. Those who have strong confidence that their college education will be a rewarding experience are found to not only perceive service quality but also have higher recommendation intention.

FINANCIAL MARKET SUPERVISION AND CAPITAL REGULATION IN VIETNAM

Le Thi Phuong Hoa, Brandeis University

ABSTRACT

Although the banking industry in Vietnam has been established for over 50 years, however, until in 1991, the government officially launched two foreign exchange trading floors in two biggest cities (Hanoi and HoChiMinh) laying a ground for the improvement to an interbank FX market in 1994. Ten years later, in 2000, two securities trading centers were introduced marking a further development of financial market in Vietnam. Currently, there is also an existence of formal gold and real estate exchange places. The fast growth in the financial market poses difficulty to financial authorities because of their inexperience in supervising this sector. A financial regulatory reform has been put into action, of which the financial market supervision and prudential regulation are key components and of the government's priority. In this context, my paper provides some in-depth introduction and analyses of Vietnam's financial market regulations and supervisory mechanism with emphasis on the banking supervision and capital regulation of the State Bank of Vietnam. This paper is structured as follows. Section I provides an overview of the recent financial sector's structure and developments. Section II introduces the supervisory mechanism which has been using in managing the financial market. Section III examines the current banking capital regulation and supervisory approaches. Section IV points out the need for a completed institutional reform by addressing main problems in monitoring financial market. Section V gives recommendations for both financial sector and regulators in order to build a safe and sound financial system, and then the conclusion.

OVERVIEW OF FINANCIAL MARKET IN VIETNAM

Global investors and economic scholars have acknowledged the significant development of banking sector and emergence of securities markets in Vietnam as the results of series of economic and financial reforms in 1990s and of the growing integration to the world economy in 2000s. The successes of these reforms have been thoroughly documented in international literature (see, for example, Griffin 1998, Riedel 1999, Hakkala, Kang, and Kokko 2001). The IMF's and World Bank's Vietnam Development Annual Reports have also recognized the accomplishment of these reforms. Even though, these economic successes are insufficient to make the Vietnamese financial market going beyond the border of the underdevelopment.

The Banking Sector

As in other typical emerging market economies, the current financial market in Vietnam mainly consists of the traditional banking sector which has been the country's financial backbone for years. The domestic deposits and credits through the banking system have been accounting for more than 90 percent of Vietnam's GDP since 2005. The increasing size of the banking market relative to other financial ones reflects the monetary deepening in the economy in the medium term, but the fragility in the financial structure in the short run as well because of the overreliance on banks.

Within the sector, the state owned banks (SOBs) still dominate (over 50 percent of deposit and credit market share, see Figure 1). Their market share has been falling due to the requirements to clean up their balance sheets for equitization and the surge of private commercial banks. SOBs' capital base remain financially weak and only total several billion US dollars which is roughly equivalent to the capitalization of a medium-sized bank. This requires the State Bank of Vietnam (SBV) to reinforce banks' capital base through equitization, thereby enhancing banks' stability and lending capacity.

The private commercial banks have been emerging considerably as a main capital channel for private businesses and households. The lax regulatory environment and the lack of longer term investment opportunities recent years give these banks a chance to put significant portions of loans into speculative activities in the booming real estate and stock markets instead of going into productive investments, thus increase the likelihood of speculative short term asset price bubbles (see Leung, 2009). Figure 2 shows that average credit growth in 2007-2009 is 37.5 percent well exceeding the government's target of 30 percent for the year while average deposit grew at roughly 32.6 percent. Almost 70 percent of credit expansion in 2007 went into stock and real estate markets. This rate went down to approximately 30 percent recently since domestic investors have shifted investing in gold and foreign currencies due to the weakening stock and real estate markets as well as the sharp depreciation of VND, the domestic currency. Such high and unsustainable level of credit expansion and lower deposit growth reveal the shortage in capital in the banking system as well as raise concerns of high inflation and asset speculation in the economy. As such, the SBV has cautioned banks to approach lending more conservatively, particularly with the current prime rate at 9 percent. In particular, banks are not allowed to lend for securities investment more than 3 percent of their total credits. In addition, banks are no longer permitted to provide loans to their affiliated securities-trading firms. This measure is likely to help keep banks sound by cutting down possible bad loans should the market crash.

The Securities Markets

The nonbank financial markets including securities and insurance sectors have expanded rapidly in recent years. The securities market, although mostly in the form of equity and bond trading and still infancy, has been gaining the consideration of foreign and domestic investors. The market capitalization (of both listed and unlisted companies) in 2009 was \$39 billion, equivalent to approximately 43 percent of GDP, increased 20 percent compared to that in 2007.

The unlisted stock market (OTC) is much larger than the formal one conducting in two stock trading centers: Ho Chi Minh Stock Exchange (HOSE) and Hanoi Stock Exchange (HNX). Securities traded in the OTC estimated to exceed three times of those traded in the official stock exchanges. The relatively small size of Vietnam's stock exchanges and prevalence of informal trading illustrate the nascent state of the country's stock market as well as its potential for growth. In other words, while the OTC exists as an active market with the potential growth, it also reveals the weakness of financial regulation in controlling the unregulated market. Over the last three years, with the introduction of a securities registration system, an integrated securities depository system, and an individual securities broker registration system, the securities intermediaries outside the stock trading centers have been basically regulated and supervised. At the beginning, the design of the securities registry and depository systems aimed at serving only listed securities, but currently these systems have been expanded to all publicly tradable ones. This expansion paves a ground for a market surveillance system by which financial regulators can better monitor the OTC market.

Bond Market

The fixed income market is also developing but still illiquid. Most of the listed bonds are of the government, with an average maturity of 3.5 years. Long-term government bonds are auctioned on HNX, while the SBV auctions short-term government bonds mainly concentrated in commercial banks. In some specific circumstances, ministries and local governments can issue municipal bonds listed on HNX to finance special projects.

The corporate bond market offers huge financing potential for Vietnamese companies as corporate bonds are viewed as highly liquid and profitable investments, often offering attractive coupon rates and flexible

conditions. Despite the benefits of corporate bonds as an investment vehicle, it is difficult for investors to evaluate corporate bonds since the country's credit rating system is not yet standardized.

Insurance Market

Life insurance and pension funds tap long-term savings of households and hence provide a source of long-term finance to businesses. Although only sharing roughly 2 percent of Vietnam's GDP, these markets, especially life insurance, considerably expanded over the past few years. With many largely untapped sectors, the insurance industry holds huge growth potential, with the growth rate of 10.2 percent and 14 percent in 2008 and 2009 respectively. Yet the agriculture, personal assets and housing insurance are some of the segments where the nonlife insurance industry has to make headway. However, the lack of good quality, high yielding, and long term investments in local currency and the incomplete regulatory and supervisory framework for the industry are the main obstacles for the development of the domestic insurance and pension funds markets.

Mechanism of financial market supervision in Vietnam

The financial supervisory mechanism in Vietnam has been traditionally based on the entity regulation whereby the whole operations of an entity are subjected to a specific regulator. This also means there is multiple-sector supervision of which each industry (banking, insurance and securities) is supervised by individual government agencies.

As shown in the Figure 3, the Government and the Prime Minister are the highest-level authorities in terms of government administrative and regulation for financial markets in Vietnam. At the operational level, different facets of financial institutions are overseen by different ministries and government agencies. The Banking Supervisory Agency (under the SBV) is directly responsible for on-site inspection and off-site supervision to credit institutions (including banks and non-bank institutions). The State Securities Commission (a division of the Ministry of Finance) is in charge of on-site inspection and off-site supervision to the two stock exchanges, securities companies, fund management companies and securities markets. The Insurance Supervisory Department (a unit of the Ministry of Finance) implements on-site inspection and off-site supervision to insurance and re-insurance companies. These three agencies are responsible for issuing licenses, formulating legal and regulatory frameworks, guiding the implementation of the frameworks and also for supervising and examining the financial institutions.

The Vietnam Deposit Insurance provides off-site supervision to depositories but has no on-site inspection as well as enforceability. Similarly, the National Financial Supervisory Commission (NFSC) supervises the whole financial market and coordinates multiple-sector supervision. However, the role of this Commission has been limited in consulting to the Prime Minister for solving problems of multiple-sector supervision (e.g. cross-sector risks and coordinating mechanism), thus the Commission also has no powerful enforceability.

As a result, for strategic sequence of policy measures and effective implementation, efforts must be well coordinated among relevant line ministries and supervisors.

Banking capital regulation and Supervisory approaches- Banking capital regulation

SBV has promulgated a number of capital prudential provisions on setting up the minimum capital and liquidity requirements to secure an effective monetary policy; direct credits to the most productive sectors, and enhance the soundness of the credit institutions.

Currently, the highest-level capital regulation is the Decree 141/2006/ND-CP specifying the statutory capital of credit institutions. At the lower levels, the SBV has issued two latest Circulars (Circular 13 and its amendment, the Circular 19) on banking capital regulation and prudential ratios in September 2010

replacing several SBV's previous Decisions on these issues. According to the Decree 141, state-owned banks and joint stock commercial banks must have minimum chartered capital of VND 3 trillion (\$2.1 billion) and VND 1 trillion (\$65 million) respectively by the end of 2008; and joint stock commercial banks have to obtain a chartered capital of VND 3 trillion by the end of 2010. Under this regulation, all credit institutions are required to submit their plans approved by the SBV and SSC to increase the chartered capital. These banks' plans must identify the solutions if banks fail to reach the minimum statutory capital at the due date, even including the plan for the mergers and acquisitions or licensing revocation.

In general, the minimum statutory capital aims at improving the banking structure and outplaying small and weak banks. Further, through mergers and consolidation for undercapitalized banks, the creation of banking businesses based on risk-taking capacity could be properly reviewed by both the banking supervisors as well as shareholders. In terms of prudential capital standards, the two Circulars taking effect in October 2010 are close to the Basel III capital standards; even some ratios are tougher than those of the Basel III. On the one hand, the new regulation strictly requires banking sector to maintain the capital adequacy ratio (CAR) at 9 percent instead of 8 percent as before. In Vietnam, CAR is calculated mostly based on equities or Tier 1 capital, and most local banks' CARs already met a minimum of 8 percent by end of 2009 in compliance with the law. It is also worth noted that the deadline for fully implementing the new CAR is in 2015, which is four years sooner than that of Basel III. The Circulars also set a risk coefficient of 250 percent for all loans secured against securities or real estate, which is 100 percent higher compared to the Basel's 150 percent risk weight. Furthermore, the Loan to Deposit ratio (LDR) is set at 80 percent, while Basel III puts no restriction on LDR. The Circulars excludes the non-term deposits by institutions and enterprises to the lenders' commercial funds, leading the actual LDR to around 60 percent.

On the other hand, banks are allowed to lend up to 25 percent of their non-term deposits and are permitted to count their deposits at the State Treasury and loans on three-month or longer terms with other credit institutions as part of their reserves for lending. Funds mobilized from bonds and deposit certificates can also be lent. These moves are expected to free up the inter-bank market and provide more capital to banks. In the short term, the new prudential ratios may put pressure on local commercial banks' capital and hinder the efforts of cutting interest rates. Nonetheless, in a longer time horizon, the capital regulation can help to ensure the stability in the financial market and well manage capital circulation.

Financial Supervisory Approaches

Traditionally, Vietnamese financial supervisors use the onsite examination (scheduled or unscheduled) to individual financial institutions. Recently, the offsite and risk based banking supervision have been applied, mostly to the banking system. Regarding on-site examination of banks, SBV carries it out on a bottom-up approach at the branch or sub-branch level. SBV and the Banking Supervision Agency have offices in 61 cities and provinces throughout the country, each with its own contingent of bank examiners. To a large extent, this organizational structure drives the examination schedule, and the tendency has been to visit all banking offices. Hence, the approach is more in the nature of a rigorous internal audit rather than a bank examination.

To be more specific, the onsite examiners usually focus on: (i) compliance with legal and regulatory framework, (ii) financial data, past and present, (iii) banks' management structure, policies, and procedures, (iv) banks' record of making decisions in the past – bad or good, and (v) comparison of this bank's condition and performance with similar banks. After assessing bank asset quality, evaluating bank policies and regulatory compliance, examiners provide banks recommendations given the banks' status quo. This method reflects a heavy reliance on the bank's own control and audit processes to identify key areas of focus for examination and improvement. In all instances, supervisors place significant emphasis

on how banks follow up on supervisory recommendations. Where improvements in processes or controls have been identified through the supervisory process, banks are expected to develop a credible plan for implementing these changes in an appropriate time frame. Bank supervisors typically have the legal authority to force banks to make the relevant improvements if this becomes necessary.

SBV's off-site surveillance system was developed with technical assistance from international institutions, especially from the IMF, WB and ADB. Monthly reports submitted by banks are automated and used to produce standard forms. Based on the data analyses via the Financial Soundness Indicators System and the evaluation of the off-site reports, a written monthly report on each credit institution (for internal use within the central bank) assigns it a rating ranging from "A" (best) to "C" (worst or problem bank). Banks rated "C" may have their licenses withdrawn. SBV is upgrading this system basing on the CAMELS rating standards to use as early warning tools orienting the onsite examination.

The risk based supervision is in the early stage with several experiments on the state owned banks and some selected commercial banks. Basically, supervisors focus on key elements of a bank's risk management and internal controls environment. Basing on an on-going basis through mandatory and periodic reporting, on-going contacts with the bank's management and on-site supervision, supervisors can evaluate the specific risks and overall risks that exposure to individual banks. However, so far the SBV has not issued any lawful documents for setting a risk benchmark and risk based banking supervision. There has been only a risk based manual written with the help of international experts, "The Risk-based Supervision Manual", which actually is not enforceable. The basic guidelines could help supervisors to identify banking risk exposures, but not comprehensively assess banking specific risks as well as systemic risks. In essence, these supervisory approaches are elements of microprudential regulation which focus entirely on the safety and soundness of individual credit institutions. The Banking Supervision Agency is restructuring its organisation, improving risk based onsite and off-site inspection, and devising intensive training banking for supervisors over the next few years.

Major Problems in Supervising Vietnam's Financial Market

First, too much fragmented and overlapping supervision impairs the efficiency of management. The lack of coordination between financial regulators, especially the lack of supervision of the cross-sector activities reduces the efficiency in supervising financial markets as a whole. As mentioned in part 2, the current supervisory framework is based on entity regulation, whereby a regulatory agency only supervises a particular types of institutions instead of business functions. Take the securities market as an example, the SSC regulates a brokerage subsidiary of a bank, but not the bank itself which may also be engaged directly in securities activities. While the central bank as the bank supervisor has a legitimate concern about banks' funding activities that affect their prudential standing, SSC is a principal regulator with regard to the requirement of due diligence, disclosure, offering process as well as compliance with minimum standards for public issuance. The SSC also regulates stock exchanges and the central securities depository unit rather than the securities trading and clearing systems. However, capital market activities are being diffused beyond institutions defined by the securities market regulation. For instance, the SBV regulates and supervises banks' marketable securities issuances while the Ministry of Planning and Investment (MPI) approves the initial public offerings of firms which are licensed by the MPI. This cross function between ministries' supervision creates not only the overlap for financial regulation and the burden for financial institutions, but also the regulatory gap and room for regulatory arbitrage in the system as each regulators cannot fully oversight the system as a whole.

Second, as a result of lacking the linkages between different regulators, financial supervision focuses only on individual financial institution rather than the financial system as a whole. The establishment of the

NFSC in 2008 indicated that the policymakers have begun to aware of the combination between microprudential and macroprudential in supervising financial regulation. However there are significant difficulties in supervising cross-sector and systemic risks as the legal status and power of NFSC are not strong enough to take responsibility of financial markets supervision and efficient coordination between different supervisory agencies.

Third, supervision does not follow the structure development and innovation of financial instruments (e.g. derivatives, corporate bonds and repos) in the market. Regarding the structure development, Vietnam's financial industry is already operating in a conglomerated form as a natural result of the global competition expected from the WTO accession. However, laws and sub-law documents have not been well-defined provisions on the establishment, organization, operation and management of finance-banking groups. Many concepts relating to financial market supervision are not defined clearly and consistently in legal documents such as financial markets, financial holding companies, inspection, and examination, etc. With respect to regulating financial instruments, so far, the framework for monitoring the transactions involving derivatives and repos has not been setup yet. Neither has there not an official law for risk-based and macroprudential surveillance. In addition, the supervisory methods are awkward and the risk based supervision is still embryonic. The Financial Soundness Indicators System on banking, insurance and securities is mostly not applied in line with international practices and standards.

Forth, the banking regulation in Vietnam is the lack of enforcement and transparent. Some contradictory arrangements such as the absence of a bankruptcy mechanism for state owned banks, the influence of local authorities, and avoidance of responsibility by supervisory staffs, are all the reasons. Another important element in the enforcement mechanism is the imposition of fines and penalties for the violation of regulations or banking criminal acts. To effectively implement the banking laws and regulations, Vietnam should establish a much stricter and standardized penalty system, including a range of enforcement powers to deal with incompetent or abusive ownership and management.

Last but not least, supervisory infrastructures are underdeveloped compared to those of financial *institutions*. Information management system is out of date in terms of technology, database and software for collecting and analyzing financial risks. Lack of experience in data and financial statement analysis makes it difficult to realize the importance of data. The banking supervisory IT system is also the main weakness limiting the development of offsite surveillance and the setup of the early warning system in the SBV. Moreover, quality and number of supervision experts and staffs have not met the requirements for the supervision of financial market, which is developing more and more complicatedly.

RECOMMENDATION AND CONCLUSION

Based on the major problems existing in the financial supervisory regulation, I provide several specific suggestions to further improve financial, and in particular, banking supervision.

First ; regarding the general supervisory policy, the SBV has to revise, supplement, promulgate new regulations on banking activities, first and foremost regulations on accounting, debt classification, allocation of provisions against risks, prudential ratios in banking activities in consistency with international standards and best practices; ensuring every entity operating in Vietnam in the same operation sector has the same rights and responsibilities, without discrimination.

Second: it is essential to complete the mechanism and enhance capacities for the SBV supervision force, performing the roles of supervision and monitoring over the banking system against risks; formulating early warning procedures of risks, especially credit risks. In the area of bank supervision, focus will be given to improve effectiveness and quality through the application of consolidated supervision, which includes both onsite and offsite supervision for an entity based on its business functions. On the whole,

the supervision of risk management should be received much attention. SBV's bank supervisors should be trained to better understand risks and risk management. Guidelines to promote transparency and information disclosure, as well as the application of core principles for efficient supervision, should be studied. Information should be available to the public regarding the financial condition of particular banks so that social control over the banking system can be suitably implemented. SBV can require commercial banks to have their operations supervised onsite by internationally recognized supervisors under terms and conditions approved by the SBV. It is advisable for the SBV to pursue a freer banking policy on the one hand and enforce strict financial discipline on the other. Only by properly regulating the financial market and making sure that all financial institutions follow the proper regulations can free market forces be conducive to the orderly progress of the financial system.

Third: given the fact that there is no domestic credit rating agency in Vietnam and only a few companies have obtained ratings from internationally recognized credit rating agencies, therefore, with regards to the securities supervision, it is important to allow the establishment of independent rating agencies which help a wide cross sector institutions to access into financial market (stocks, bonds, and commercial papers). The rating system will enhance corporate governance and transparency in the financial system. The financial supervisors can use the independent rating system as a useful information channel in evaluating specific and systemic risk of financial institutions.

Finally: for financial sector, to build a safe and efficient financial system in Vietnam, it is recommended to have sustainable expansion plans, technology modernization and competitiveness improvement. Accordingly, financial institutions should follow international standards in risk management, asset and liability management, and capital management.

CONCLUSION

The significant growth of Vietnam's financial market has highlighted the urgent need to upgrade the financial market infrastructures and to strengthen the financial sector supervision. Adopting stringent prudential regulations, especially proper capital requirements, developing and strengthening banking supervision approaches, improving risk management and building an independent credit rating system in accordance with internationally accepted standards are also critical for the current financial supervision system in Vietnam.

RE-THINKING FINANCIAL NEURAL NETWORK STUDIES: SEVEN CARDINAL CONFOUNDS

Charles Wong, Boston University
Massimiliano Versace, Boston University

ABSTRACT

Neural networks are among the best adaptive analysis tools for decision-making. As the field approaches maturity, there should be a convergence of applied theoretical and empirical findings. In financial analysis studies, neural networks superficially appear to deliver. Closer examination however finds a theoretical intra-disciplinary mismatch between neural network models and an empirical inter-disciplinary mismatch between neural network and financial approaches and analyses. Based on a sample of 25 financial neural network studies from the past decade, this paper explores the different characteristics of the major network categories used and the cardinal confounds in applying them to finance. In so doing, this paper provides an updated snapshot on the state of the art in applied neural networks for financial decision-making and specific suggestions on maximizing the utility of neural networks.

INTRODUCTION: NEURAL NETWORKS AND DECISION-MAKING

Financial time series are collections of financial indicators over time. A prime example is the daily closing price of a given stock over time. At any time during the trading day, a buyer and a seller may agree upon a transaction price. The buyer ideally agrees only if the price reflects her best knowledge regarding the fair market value – for example, the bid may reflect an estimate of the net present value of all expected future cash flows (Chartered Financial Analyst Institute, 2009). Vice versa, the seller should only agree when the price accurately reflects his best estimate of fair market value. Barring cases where the traders are forced to sell with regret to meet extrinsic obligations, public trading prices usually reflect the mutually agreed assessment of the stock by human decision-makers (Kaizoji & Sornette, 2008). By extension, a series of publicly available prices reflects a series of human decisions over time. Unfolding this decision making process by analyzing the time series can lead to more efficient financial markets, a deeper understanding of biological intelligence, and the development of technological tools that seek to emulate human decision-making. Neural networks are among the best adaptive analysis tools due to their biologically inspired learning rules; they better accommodate non-linear, non-random, and non-stationary financial time series than alternative techniques (Lo, 2001; Lo & Repin, 2002; Lo, 2007). Much research in the past decade applies a variety of neural network tools to financial time series with typically strong and compelling empirical results (e.g. Duhigg, 2006; Hardy, 2008). See table 1.

Table 1: Survey Information

Category	Instances	Typical Result
Slow learning	10	Improved vs. market
Fast learning	6	Much improved vs. market
Maximum margin	3	Improved vs. market
Temporal sensitive	6	Improved vs. market
Mixture of networks	4	Much improved vs. market

Table 1: A survey of 25 studies that applied neural networks to financial stock time series analysis over the past decade. Categories divide into five distinct models included with frequency and typical results. The total exceeds 25 because individual studies may include multiple networks.

Two trends appear to be dominant from Table 1. First, neural networks appear to outperform the market, which is typically defined as a random walk or buying-and-holding of an index. Second, the results appear robust regardless of network category. The bias towards slow learning models in Table 1 probably reflects their earlier availability (Rumelhart, Hinton, & Williams, 1986).

This paper has a dual purpose: (1) to classify the main neural network models used in financial studies based on their learning mechanism; and (2) to identify and address the cardinal confounds that may reduce confidence in the typical study's findings that neural networks consistently and robustly outperform the market regardless of network model. Section II explores the five distinct network models and their applicability to financial time series. Section III discusses the seven confounds that can serve as guideposts for applying neural networks to financial decision-making studies. Section IV concludes with the lessons learned.

WHAT ARE NEURAL NETWORKS?

A basic model of decision-making gathers evidence, weighs it, and aggregates it in favor of one decision or another (Siegler & Alibali, 2005). Figure 1 (left) shows a schematic of this decision making process. It conforms in all manners of operation to typical models of regression analysis (Bishop, 2006).

Figure 1: Schematic

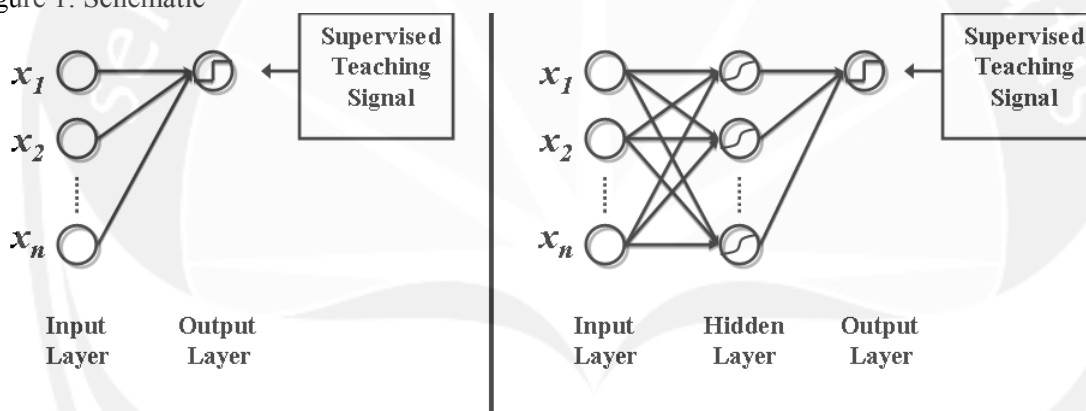

Figure 1: (left) A classic model of decision-making, which also conforms to a general model of regression. The evidence, or inputs ($x_1 \dots x_n$) in the input layer, are weighted and gathered to form an output, which applies a threshold to decide among two choices. (right) A slow learning model of neural network decision-making. Inputs in the input layer are weighted and gathered for each hidden node. Hidden nodes process these sums via non-linear transfer functions, represented by the sigmoid symbol. The output layer weighs and gathers these hidden values to form the final decision, thresholded among two choices. The supervised training signal provides the expected output decision when training the models.

Over the past decade, an increasing number of studies have used various types of artificial neural networks for analyzing financial time series (e.g. Zhu et al., 2008; Chen et al., 2006; Leung and Tsoi, 2005; Thawornwong and Enke, 2004; Versace et al., 2004). The term artificial neural network (hereafter, termed neural network) refers to a class of flexible, non-linear, and adaptive models inspired by biological neural systems (Bishop, 2006; Hornik et al., 1989; Rumelhart et al., 1986; Rosenblatt, 1958). The key addition in neural network models is the brain-like hierarchical structure. Inputs typically aggregate in hidden layer nodes that perform further levels of processing before finally favoring a particular decision in the output layer. See Figure 1 (right). This additional processing adaptively explores hidden relationships among the evidence, but adds immense complexity. Exploring this complexity led to a divergence of multiple forms of neural networks divisible by learning rules and structures. This paper selects 25 neural network financial studies spanning 1997-2009 and categorizes the models used based on network learning rule. The five models are: slow learning models, fast learning models, maximum margin models, temporal sensitive models, and mixture of network models.

A Slow Learning Models

Slow learning models are among the earliest forms of modern neural networks, relying on the work of McCulloch and Pitts (1943), Rosenblatt (1958), Rumelhart et al. (1986) and others. Processing proceeds in three steps. See Figure 1 (right). First, the input layer nodes weigh the input, with each node representing one input feature. The connections from each input node to each hidden node have individual weights. Second, the hidden layer nodes typically apply a non-linear, sigmoid shaped transfer function to the aggregate of these weighted inputs. The selection of non-linear, sigmoid transfer functions are inspired by physiological studies of nerve functions (e.g. McCulloch and Pitts, 1943) that allow enhanced exploration of complex relationships in the data. Finally, the output layer weighs and aggregates these hidden layer node values and applies a threshold to decide on one of the possible output options.

Slow learning models are highly distributed. All input and hidden nodes are involved for each output decision. If the output of the network does not match the correct output as dictated by the supervised teaching signal (e.g. decisions made by a human expert on the same data), the slow learning model typically adjusts all weights incrementally until the output values sufficiently match. Since all connection weights are inter-related, the adjustments are necessarily small and incremental, leading to slow and measured convergence on the correct output. Hence, these models are termed slow learning. Known complications of slow learning models include their tendency to overfit the data, failure to converge to acceptable rates of correct outputs, and their poor adaptability to new data. Overfitting refers to the network developing overly specific associations to in-sample data that generalize poorly on novel out-of-sample data sets. The failure to converge is caused by the inter-relatedness of all node connections. Adjusting one connection favorably can cause another connection to become unfavorable and vice versa until the network oscillates between optimal decisions. This also renders the trained network unable to incorporate new data without a complete reset and refresh of all prior learning. The majority of recent financial studies with neural networks use networks derived from this fundamental architecture (e.g. Kumar and Bhattacharya, 2006; Kaastra and Boyd, 1996; Zhu et al., 2008; Kirkos et al., 2007; Brockett et al., 2006). Recent research exploring different slow learning non-linear heuristics with kernel smoothing (Zhang, Jiang, and Li, 2005), genetic algorithms (Kim, 2006), and Lagrange multipliers (Medeiros, Terasvirta, and Rech, 2006) mitigate – but do not eliminate – the complications.

B Fast Learning Models

Fast learning models address the complications of non-convergence and poor adaptability to new data of slow learning models. Primary examples include probabilistic and radial basis function networks (Moody & Darken, 1989). The key difference from slow learning models is the use of a storage layer instead of a hidden layer. Figure 2 (left) shows the typical form of a fast learning model.

Processing proceeds in three steps. First, the input layer nodes form the input. Each node represents one input feature; all nodes in aggregate form a single, complete input pattern. Each storage layer node represents one complete stored pattern. The second step identifies the single storage pattern most similar to the input pattern via a kernel, which is a mathematical function that determines the similarity between patterns (Bishop, 2006). Finally, the output node provides the decision associated with that storage pattern's node.

Fast learning models are highly independent. Typically only one storage node is involved in each output decision. If the output of the network does not match the correct output as dictated by the supervised teaching signal, the fast learning model can generate a new, independent storage node with the correct output. Training is immediate and there are no convergence issues. Fully trained models can incorporate

new data without affecting previously stored patterns. Hence, these models are termed fast learning. Overfitting remains a complication.

Figure 2: Typical Form of a Fast Learning Model

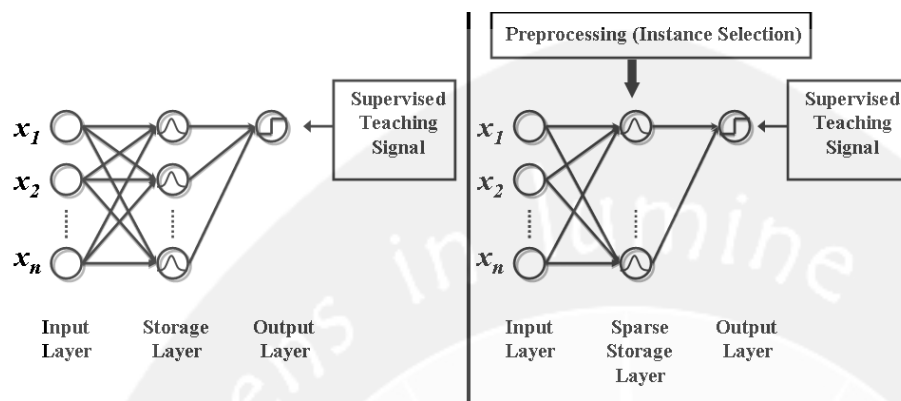

Figure 2: (left) A typical fast learning model. The storage layer replaces the hidden layer from slow learning. Each storage node is independent of each other. The Gaussian symbol represents a common non-linear distance kernel. See text for details (right) A typical maximum margin model, which extends the fast learning model. The preprocessing step limits the number of nodes in the sparse storage layer.

C Maximum Margin Models

Maximum margin models, such as support vector machines (Cortes & Vapnik, 1995), address the overfitting complication of fast learning models. The key difference from fast learning models is the addition of preprocessing. Figure 2 (right) shows the typical form of a maximum margin model.

Processing proceeds in four steps. The first step, preprocessing, eliminates all unnecessary in-sample input patterns. The preprocessing identifies the key patterns that differ just nearly enough to delineate the margins between the correct, supervised output decisions. These are termed the support vectors. Preprocessing typically relies on slow learning and related model mechanisms such as Lagrange multipliers, quadratic programming, Newton's method, or gradient descent (Bishop, 2006). The final three steps are the same as in fast learning models.

Maximum margin models have very sparse storage layers that reduce the chances of overfitting the dramatically reduced in-sample training data support vectors. However, since the pre-processing relies on slow learning rules, maximum margin models are susceptible to poor adaptability and non-convergence during their pre-processing stages.

D Temporal Sensitive Models

Temporal sensitive models allow past data and changes in the data to influence current decisions. This can be highly effective in a financial time series where a model needs to track changes in the data over time to identify temporal patterns. Primary examples include Jordan networks (Jordan, 1986), Elman networks (Elman, 1990), and time delay networks. Figure 3 shows the typical form of a temporal sensitive model.

Temporal sensitive models can track the input data as it changes over time. Variants allow the model to consider input data from time $\{t, t-1, t-2, \dots, t-\infty\}$ to form an unprocessed temporal pattern or to consider the hidden or output layers values from $\{t-1, t-2, \dots, t-\infty\}$ to form a highly processed temporal pattern. Processing is otherwise identical to slow learning models. While temporal sensitive models can

theoretically incorporate fast learning rules, this configuration tends to be under-explored (e.g. Leung and Tsoi, 2005) due to the extensive modifications required.

Figure 3: Typical Form of a Temporal Sensitive Model

Figure 3: A typical temporal sensitive model, in this case, an out-to-input feedback model with slow learning. Inputs may include patterns over time and feedback from the prior output. $x_{t,n}$ are the inputs from time t , and z_t is the output from time t .

Temporal sensitive models with slow learning inherit all vulnerabilities of slow learning models. In addition, they are also exposed to potential saturation issues. Saturation occurs, for example, when placing a speaker near a microphone in an infinite loop (Rabiner and Juang, 1993; Armstrong et al, 2009) that causes output intensities to continually increase towards infinity regardless of other microphone inputs. The practical result is that the speaker sustains its maximum output – a maximum volume screech. Similarly, in a temporal sensitive slow learning model with output-to-input (i.e. Jordan, 1986) or hidden-to-input feedback (i.e. Elman, 1990), each feedback connection transmits the product of its maximum thresholded output (e.g. typically one) and their node connection (e.g. up to infinity) to the input node. If the produce of the connection weights in the loop exceeds one, the network can automatically self-sustain a constant output decision regardless of changes in the input. This renders the network non-adaptive and non-reactive to the environment. Additional safeguards and mechanisms are required that either increase the complexity or reduce the sensitivity to time.

E Mixture of Network Models

Mixtures of networks are meta-models that combine multiple neural networks to simulate a “divide and conquer” approach for the data set. In contrast to individual models that may overfit the data in their attempt to capture the relationships that underlie all the data, mixture of network models allow each network to specialize in specific patterns that fit a portion of the data. Primary examples include AdaBoost (Freund and Schapire, 1996) and its variants (e.g. West, 2000; West et al., 2005).

Processing proceeds in two steps. First, one network attempts to learn the correct decision rules using all in-sample data. The cases where it failed to produce correct output decisions form the in-sample data for the next network. This repeats iteratively for either a specified number of networks or until there are no more incorrect output decisions. Finally, a meta-network weighs the values from each network to arrive at a final decision.

In addition to inheriting all vulnerabilities of the component networks, mixture of network models are highly complicated and susceptible to hand-tuning where small parameter changes can have dramatic impacts.

Despite the theoretical differences, the studies appear to show robust results across all neural network types on a wide range of financial data. However, many of these studies include one or more significant confounds that limit the utility of these tools for out-of-sample use. The vulnerability to these confounds may explain why neural networks have, to the present day, had a more limited impact on financial decision making than previously estimated by the community (Kelly, 2007; Holden, 2009). The next section details seven cardinal confounds that may illuminate how neural networks may be better developed and evaluated for financial decision-making, thereby enhancing differences between network types.

SEVEN CARDINAL CONFOUNDS IN NEURAL NETWORK

Addressing seven cardinal confounds may help researchers and traders make more informed choices in applying neural networks to financial decision-making. These are: risk neglect, survivorship bias, timing bias, scalability, data dredging, context blindness, and inconstancy.

A. Risk Neglect

There exists much research in financial decision-making on evaluating the prudence of an investment. One aspect revolves around the capital asset pricing model (Ross et al., 2005; Chartered Financial Analysts Institute, 2009). This model adjusts the return by its accompanying risks, typically as measured by its volatility. For example, an investment that averages 20% gains including a -100% maximum loss is far less prudent than an investment that steadily produces 5% gains. A Sharpe Ratio (Sharpe, 1994), for example divides the excess gain by the standard deviation to provide a simple, objective ratio.

Few of the studies surveyed included any specific discussion on this issue (e.g. Lin et al., 2006; Yu et al., 2008). The remaining studies typically discussed either higher returns in absence of risk or lesser risk in absence of returns. To address this issue, a study needs to include risk-adjusted return metrics or include information that can lead to calculation of the same. Benchmark returns comparisons are insufficient by themselves as they may exhibit different levels of risk and returns.

B. Survivorship Bias

One of the most famous of stock indices, the Dow Jones Industrial Average, by definition has 30 members. If any member fails or weakens, it is replaced by another stock. While selecting this index or members of this index intuitively should appear to provide a fair and transparent historical data set on which to study, doing so may inadvertently bias the sample. If a study selects an index member as of December 31 for back-testing or training during the preceding period January 1 – December 31, that study may become vulnerable to survivorship bias (Chartered Financial Analyst Institute, 2009). It is exploring data during a year in which it was impossible for the stock to become bankrupt or acquired. If it had, it would not have been a member as of December 31. As the recent bankruptcy de-listing of General Motors in 2009 shows, Dow Jones Industrial Average members are not immune to this possibility. Research shows that survivorship can significantly and artificially inflate nominal returns (Aggarwal and Jorion, 2010).

The majority of the studies used composite indices and may be susceptible to this survivorship bias. For the remaining studies that used non-member individuals, the selection process was unspecified. While

other studies relating neural network models to predicting fraudulent annual reports or bankruptcies are promising (e.g. Boyacioglu et al., 2009; Ng, Quek, and Jiang, 2008; Gaganis et al., 2007), it cannot be taken for granted that a neural network would automatically screen out stocks heading for failure.

Possible improvements may include randomly selecting some or all stocks that were members of the Dow Jones Industrial Average index as of a historical date and using data succeeding that date. While this still may inadvertently leverage off of the stock selection process for the index, it does help the simulation better reflect reality.

C. Timing Bias

Financial time series data is notoriously highly heteroskedastic and non-stationary. A model that appears to deliver high risk-adjusted returns in one time period may perform inconsistently on another. The study test period may not accurately represent the overall market even shortly before or afterwards. For example, a model may be strong during a period of market expansion, but may not be robust over a period of market contraction. The majority of the studies showed results based on relatively short testing time periods. Sample size estimations aside (Berenson and Levine, 1998), the market environment changes too rapidly for short testing period results of less than one year – 250 trading days – to represent a replicable return.

Typically, investment manager and fund tracking includes a measure of the past performance over at least three years with statistics like proportion of successful years, the worst performance during a year, and how many years the fund has been in operation (Schwager, 1994; Morningstar, 2010). Including similar metrics may help bolster the impact of study results.

D. Scalability and Complexity Concerns

Financial time series contain massive amounts of data, with new data arriving every trading day. Neural networks are adaptive and reliant on data. Training them on new data as they become available makes use of their flexibility. However, the slow learning neural networks and their derivatives require resetting the network and retraining on all accumulated data to incorporate new data. Only a fast learning neural network model may be suitable since it allows training on new data without overwriting prior learned patterns.

Complexity refers to a network's robustness. Neural networks are notoriously complex models that often incorporate many different settings and values. If modifying one assumed value can alter the results and there are dozens or hundreds of settings, this exposes the network to hand-tuning that relies more upon the user's specific knowledge and experience than on the powerful feature of neural networks to extract general trading rules from data streams. A streamlined slow or fast learning model is more favorable than a complex mixture of networks.

E. Data Dredging

All neural networks, regardless of the learning rule and structure, are non-parametric and thus highly reliant on the quality and clarity of input data and any preprocessing (Bishop, 2006). The relevance of the input features is fundamental to neural network prediction success (Witten & Frank, 2002). As with nearly all decision tasks, there appears to be a limitless set of potential features in financial decision-making with only a subset being predictive and the remainder generating excessive noise and bias if included (Chartered Financial Analyst Institute, 2009; McQueen and Thorley, 1999).

Two of the studies (Kim, 2006; Versace et al., 2004) used a form of feature selection to remove potentially confounding variables. The remainder studies generally contained overwhelming numbers of

input features, often all highly related. While validation results are very important, additionally testing whether the variables conform to common sense may be vital to improving the explanatory power of a model. One common sense rule that can be automated to promising results is to cluster correlated input features together and select at most one feature per cluster (Schwager, 1994; Wong and Versace, 2010a). More research to improve feature selection techniques is needed.

F. Context Blindness

Given a set of clear, high quality features, a decision-making system still needs to interpret them within contexts that can alter their import. Human subjects often treat similar tasks differently under different contexts (e.g. Carraher, Carraher, & Schliemann, 1985; Bjorklund & Rosenblum, 2002). Working memory allows features to be tracked over time to extract a context (Kane & Engle, 2002; Baddeley & Logie, 1999). Context sensitivity enables the decision-maker to disambiguate different feature inputs that may be identical at single points in time (Kane & Engle, 2002).

To better model human decision-making with context sensitivity, a neural network model must be context sensitive. For example, tracking the price over time to determine whether the market is uptrending (bullish) or downtrending (bearish) provides contextual cues (Schwager, 1994). Outside of the temporal sensitive models, only two (Chen et al., 2006; Kim, 2006) used input features that embed temporal triggers or crossing points with limited context sensitivity. However, all temporal context sensitive studies relied on slow learning network models with their accompanying non-convergence and poor adaptability to new data. Temporal sensitive models with slow learning are also highly vulnerable to complexity and scalability concerns when the models include any form of feedback (Wong & Versace, 2010c). Future studies should explore combining temporal models with fast learning, which may be less vulnerable.

G. Inconstancy

The financial time series represent buyer and seller actions in a dynamic marketplace that is bound by the laws of supply and demand (Mas-Colell et al., 1995). A high volume buy order in a volatile or illiquid market can trigger a shift from a neutral market to a bullish, uptrending one. The prices may continue to rise such that the ordered trade may not be executed at the desired prices. These are slippage, bid/ask spread, and execution risks (Chartered Financial Analyst Institute, 2009). A trader in real life may not be able to meaningfully replicate the study results due to these effects. Calculating results net-of-trading-costs may better demonstrate more realistic risk-adjusted returns. Future work should also consider applying populations of neural networks to explore dynamic marketplaces, supply-and-demand relationships, and social learning.

LESSONS LEARNED

To better unlock the potential of neural networks for financial decision-making, more research is needed to make informed choices on network type, network enhancement, and network usage. By identifying and addressing seven cardinal confounds and by analyzing which network types are most appropriate for financial data derived from chaotic, non-stationary human decisions, this paper can propose a series of recommendations for future work:

- To improve the probability of the results being replicated on out-of-sample data, include a risk/reward metric, a random sample of stocks instead of an index, and results over a sufficient time frame to include multiple market conditions.

- To improve the likelihood that the results are due to the network predictive power, include a discussion on the effects of parameterization and the network's ability to incorporate new or different data.
- To maximize neural network utility, adaptability, and transparency, select a fast learning model. The independent storage nodes allow for modular design, direct pattern analysis, and adaptability to new data. For these reasons, enhancing a fast learning model with context sensitivity or mixture of network rules may provide more intuitive and therefore effective behaviors and results than currently exist.
- To emulate a human trader's judgment, include network enhancements for modeling automatic feature selection (Wong & Versace, 2010b), context sensitivity (Wong & Versace, 2010c), and if possible, feedback effects from altering the supply and demand relationships.

In addition, more multi-disciplinary collaborations may prove fruitful for applied neural networks. For biologically inspired neural networks to effectively emulate biological financial decision-making, they should extend and conform to existing financial findings. The seven cardinal confounds are well known in the financial literature and serve as guiding posts for evaluating and informing financial studies. If neural networks can also adopt these guideposts, then the choices of model, data, and design may similarly be well-informed. This drives the future of neural network financial studies towards more intelligent decision-making.

BIOGRAPHY

Charles Wong is a PhD candidate at the Cognitive and Neural Systems program, Boston University. He has previously worked for Deutsche Bank AG and KPMG LLP in New York. He can be contacted at cwong@bu.edu.

Max Versace (PhD, Cognitive and Neural Systems, Boston University, 2007) is a Senior Research Scientist at the Department of Cognitive and Neural Systems at Boston University, Director of Neuromorphics Lab, and co-Director of Technology Outreach at the NSF Science of Learning Center CELEST: Center of Excellence for Learning in Education, Science, and Technology. He is a co-PI of the Boston University subcontract with Hewlett Packard in the DARPA Systems of Neuromorphic Adaptive Plastic Scalable Electronics (SynAPSE) project.

THE INFLUENCE OF ULTIMATE OWNERSHIP TO EARNINGS MANAGEMENT: EVIDENCE FROM INDONESIA

I Putu Sugiarta Sanjaya, Atma Jaya Yogyakarta University

ABSTRACT

Governance of public companies in Indonesia is concentrated in a particular group as the controlling shareholder or the largest ultimate ownership. This group is like family, government, financial institutions are widely held, companies owned widely, or others as a controlling shareholder. He/she has two rights as control rights and cash flow rights. Differences of two rights will affect agency problems. Siregar documents that 99.09% of public companies in Indonesia have a concentrated ownership structure at cut off 10% control rights. Febrianto (2005) suggests that 92% of public companies have concentrated ownership structures in Indonesia at cut off 20%. Based on this phenomenon, this study aims to investigate whether the difference between control rights and cash flow rights of the largest ultimate owner influence the owner to manipulate earnings. This study collects data companies in manufacturing industries in Indonesia Stock Exchange during the period 2001-2007. There are 786 firms year. The results suggest that the greater difference between control rights and cash flow rights lead to greater earnings manipulation. This indicates that the greater the difference two rights, the largest ultimate ownership more manage earnings for his/her personal goal. The owner (controlling shareholder) manipulates earnings to hide the acquired private benefits through expropriation.

JEL: G32; M41

KEYWORDS: Ultimate Ownership, Control Rights, Cash Flow Rights, Cash Flow Right Leverage, and Earnings Management

INTRODUCTION

The objective of this research is to investigate whether controlling shareholder manages earnings. The issue is most important to be revealed because ownership of public companies in Indonesia is concentrated (Claessens et al., 2000; Febrianto, 2005; and Siregar, 2006) and low protection for noncontrolling shareholders (Johnson et al., 2000; and Leuz et al., 2003). Therefore, controlling shareholder is motivated to manage earnings.

According to Claessens et al. (2000), most public companies in Indonesia are owned by single controlling stockholder. Controlling shareholder is also the biggest ultimate ownership. Febrianto (2005) finds that 92% public companies are owned ultimately. The finding is consistence with Siregar (2006). Siregar (2006) documents 99,09% public companies in Indonesia owned ultimately at cut off 10% control rights. The concentration will generate the separation between cash flow rights and control rights. The separation is named cash flow right leverage.

The leverage will entrench controlling shareholder to expropriate (abuse of power) noncontrolling shareholders. Case of Robert Tantular as controlling shareholder of PT. Bank of Century Tbk is expropriation in Indonesia. Expropriation is happened because controlling shareholder has lower finance incentive compared with his/her control to the company. The situation indicates the agency problem between controlling shareholder and noncontrolling shareholders. Controlling shareholder makes decision only for her/his benefit. According to Fan and Wong (2002) when the controlling shareholder is

entrenched by a large separation of control rights and cash flow rights, credibility of the accounting information is reduced. It is happened because the controlling shareholder controls effectively to firm and he/she also controls the process of financial reporting. Therefore, whether the condition is an incentive for controlling shareholder to manage earnings?

The remainder of the paper is organized as follows. Section 2 discusses the relevant literature. Research method is described in Section 3. Section 4 provides the results of analysis and section 5 concludes the paper.

LITERATURE REVIEW

La Porta et al. (1999) are the first researchers conducting a research of ultimate ownership. Based on cut off 20% control rights, La Porta et al. (1999) find 36% world companies owned widely. Family controls 30% companies and state controls 18% companies controlled by state. The controlling shareholder controls 26% companies through pyramid. All samples, the controlling shareholder are family. Manager of 69% companies is part of controlling shareholder family. Claessens et al. (2000) develop La Porta et al. (1999). Claessens et al. (2000) investigate separation of ownership and controller in nine countries of East Asia. Claessens et al. (2000) find that in Indonesia, control rights of controlling shareholder are bigger than his/her cash flow rights. More than 2/3 companies is controlled by single controlling shareholder.

Faccio and Lang (2002) develop La Porta et al. (1999) and Claessens et al. (2000). Faccio and Lang (2002) find 36,93% companies owned dispersedly and 44,29% companies controlled by family. Demirag and Serter (2003) research ultimate ownership on Istanbul Stock Exchange. Demirag and Serter (2003) find most companies owned by ultimately and controlled by family through pyramid. Siregar (2006) investigates ultimate ownership in Indonesia. Siregar (2006) indicates most companies controlled by controlling shareholder. Based on cut off 10%, 99,09% of public companies has concentrated ownership. Based on cut off 10%, Siregar (2006) finds 66,44% companies controlled through pyramid.

There are consequences of concentrated ownership. Claessens et al. (1999) document higher cash flow rights increasing value of the firm. Higher control rights reduce the market value of the firm. Higher wedge will reduce value of the firm. Faccio et al. (2001) find higher O/C ratio increasing dividend. La Porta et al. (2002) document higher cash flow rights increasing value of the firm. Claessens et al. (2002) document higher cash flow rights increasing value of the firm. However, Claessens et al. (2002) also document higher control rights reducing value of the firm. Lins (2003) also finds higher control rights reducing value of the firm. Lemmon and Lins (2003) document higher exceeding control rights and cash flow rights reducing value of the firm. Higher cash flow rights positively effect to value of the firm. Siregar (2006) finds higher cash flow rights increasing value of the firm and dividend. Higher control rights negatively affect dividend. Cash Flow right leverage interacted management of controlling shareholder negatively affects to dividend.

Schipper (1989) defines earnings management as a purposeful intervention in the external financial reporting process with the intent of obtaining some private gain. Healy and Wahlen (1999) define earnings management as follows. Earnings management occurs when managers used judgment in financial reporting and in structuring transactions to alter financial reports to either mislead some stakeholders about the underlying economic performance of the company or to influence contractual outcomes that depend on reported accounting numbers. Scott (2006) defines earnings management as the choice by a manager of accounting policies so as to achieve some specific objective. According to Healy and Wahlen (1999) and Scott (2006), there are some

motivations to manage earnings. There is bonus motivation (Healy, 1985; Gaver et al., 1995; Holthausen et

al., 1995; and Guidry et al., 1999), contractual motivation (Sweeney, 1994; DeFond and Jiambalvo, 1994), political motivation (Jones, 1991; Cahan, 1992; Na'im and Hartono, 1996; Key, 1997; and Navissi, 1999), tax motivation (Dopuch and Pincus, 1988), changing of CEO motivation (Defond and Park, 1997), capital market motivation (Perry and Williams, 1994; Burgstahler and Dichev, 1997; Teoh et al., 1998a; Teoh et al., 1998b; Rangan, 1998; Erickson and Wang, 1999).

Cash flow right leverage represents the difference between value of cash flow rights and value of control rights. Value of cash flow right leverage can be positive or zero because control rights definitely is higher or equal to cash flow rights. Agency problem will be reflected at value of cash flow right leverage. The higher cash flow right leverage, agency problem is higher.

The higher cash flow right leverage is an incentive and opportunities for controlling shareholder to expropriate (Gugler and Yurtoglu, 2003). It is based on argument of negative entrenchment effect (Yeh, 2005). It means that the higher cash flow right leverage causes higher expropriation. Expropriation is conducted by controlling shareholder to increase the private benefit. The higher private benefit effects higher earnings management.

Two empirical evidences (Kim and Yi, 2006; and Haw et al., 2004) show that the higher cash flow right leverage motivates controlling shareholder to manage earnings. This research estimates that the higher cash flow right leverage effects the higher earnings management. The estimation is based on the argument of negative entrenchment effect (NEE). NEE suggests that controlling shareholder is interested to use his/her control rights to obtain the private benefit by doing expropriation (Yeh, 2005). In this situation, controlling shareholder manages earnings to avoid the noncontrolling shareholders observation. The following is hypothesis about cash flow right leverage and earnings management.

H₁: Cash flow right leverage of controlling shareholder positively effects earnings management.

RESEARCH METHOD

The samples of this research are manufacturing industrial companies on Indonesian Stock Exchange (IDX) from 2000 to 2007. The samples include big and small companies to avoid bias of selecting sample (Jogiyanto, 2010). Collecting data in this study is archival data. One of the forms of archival data is secondary data. The secondary data in this study is as follows.

1. Indonesian Stock Exchange for audited financial statement.
2. OSIRIS Database for the data of ultimate ownership.
3. The Data Centre of Indonesia Business for ultimate ownership.

Ownership of public companies is classified into dispersed and concentrated ownership. This study classifies dispersed and concentrated ownership at cut off 10%, 20%, and 30% control rights.

Variables of this research include independent variables, dependent variable, and control variables. Independent variables include cash flow right leverage. Dependent variable is earnings management. Control variables include non discretionary earnings, size, and leverage. Cash Flow right leverage is difference between control rights and cash flow rights. Cash flow right leverage is value obtained from control rights minus cash flow rights. Some researchers mention the leverage as ratio of cash flow right to control rights (Faccio et al., 2001; Lemmon and Lins, 2003). Earnings management represents dependent variable. Earnings management is proxy discretionary accruals. Kang and Sivaramakrishnan Model (1995) are applied in this study.

Kang and Sivaramakrishnan's model (1995) is as follows.

$$Ak_{i,t}/A_{i,t-1} = \Phi_0 + \Phi_1(\delta_1 REV_{it}/A_{i,t-1}) + \Phi_2(\delta_2 EXP_{it}/A_{i,t-1}) + \Phi_3(\delta_3 GPPE_{it}/A_{i,t-1}) + v_{it} \quad (1)$$

Where:

$\delta_1 = AR_{i,t-1}/REV_{i,t-1}$; $\delta_2 = APB_{i,t-1}/EXP_{i,t-1}$; $\delta_3 = DEP_{i,t-1}/GPPE_{i,t-1}$ $TA_{it} = LB_{it} - AKO_{it}$
 TA_{it} : Total accruals of company i on period t.

LB_{it} : Net income before extraordinary item, discontinued operation, and changes of accounting policies of company i on period t.

AKO_{it} : Operating cash flow of company i on period t.

A_{it-1} : Total asset of company i on period t_1 .

DEP_{it-1} : Depreciation and amortization of company i on period t_1 . AR_{it-1} : Account receivable of company i on period t_1 .

REV_{it} : Revenue of company i on period t.

APB_{it-1} : Current asset - account receivable - cash - current liabilities of company i on period t_1 .

EXP_{it} : Net sales - income from operating - depreciation expense of company i on period t.

$GPPE_{it}$: Gross plant property and equipment of company i on period t.

Non discretionary accruals (AND_{it}) are obtained from the following equation.

$$AND_{it} = \Phi_0 + \Phi_1(\delta_1 REV_{it}/A_{i,t-1}) + \Phi_2(\delta_2 EXP_{it}/A_{i,t-1}) + \Phi_3(\delta_3 GPPE_{it}/A_{i,t-1}) \quad (2)$$

Discretionary accruals (AD_{it}) are obtained from difference between total accruals minus nondiscretionary accruals. Discretionary accruals are obtained from residual of equation 1. The equation is as follows.

$$AD_{it} = TA_{it}/A_{i,t-1} - [\Phi_0 + \Phi_1(\delta_1 REV_{it}/A_{i,t-1}) + \Phi_2(\delta_2 EXP_{it}/A_{i,t-1}) + \Phi_3(\delta_3 GPPE_{it}/A_{i,t-1})] \quad (3)$$

Earnings management is conducted to bonus motivation (Healy, 1985; Gaver et al., 1995; Holthausen et al., 1995; and Guidry et al., 1999). According to Yang and Krishnan (2005), non discretionary earnings are as proxy for bonus plan. The earnings are accounting earnings minus discretionary accruals. Leverage is total debt divided total asset. According to Sweeney (1994) and DeFond and Jambalvo (1994), companies with large leverage tend to manage earnings. Companies may be sensitive to political problem. They tend to manage earnings to reduce the political expense (Jones, 1991; Cahan, 1992). According to Johnson and Ramanan (1988), size of the firm negatively influences earnings management.

Empirical Model is used to test H_1 as follow.

$$ABSDA_{it} = \alpha + \beta_3 CFRL_{it} + \beta_4 LND_{it} + \beta_5 LEV_{it} + \beta_6 Sz_{it} + \varepsilon_{it} \quad (4)$$

Where:

$ABSDA_{it}$: Absolute discretionary accruals of company i on period t.

$CFRL_{it}$: Cash flow right leverage of controlling shareholder of company i on period t.

LND_{it} : Non discretionary earnings of company i on period t divided total asset of company i on period t_1 .

LEV_{it} : Company's leverage of company i on period t.

Sz_{it} : Size of the firm of company i at period t .

ε_{it} : Error terms.

EMPIRICAL RESULTS

Table 1: Statistic Descriptive

	N=786				N=739	N=640

D1	0.152672	1.000000	0.000000	0.359900	0.151556	0.031250

At cut off 10%, average of absolute discretionary accruals (ABSDA) are 0,062751. Minimum value of ABSDA is 0,000206. The value indicates all manufacturing companies do not manage earnings. Excess control rights to cash flow rights are shown on cash flow right leverage (CFRL). Average of CFRL is 3,76%. Variable D_1 is dummy variable to control heterocedasticity problem at empirical model to test hypothesis. Before testing of hypothesis, this research tests classical assumption. The results show normal distribution. There are not heterocedastity, autocorrelation, multicolliniarity.

The results on Table 2 show that coefficient of cash flow right leverage is positive significantly at 5%. The results indicate that higher cash flow right leverage increase earnings management. The results indicate that every 1% increasing of cash flow right leverage, earnings management increases 2,8% at cut off 10% point. Based on the results, hypothesis H_1 is supported. The higher value of cash flow right leverage indicates higher agency problem.

***alpha 1%; **5%; *10% $ABSDA_{it} = \alpha + \beta_1 CFRL_{it} + \beta_2 LND_{it} + \beta_3 LEV_{it} + \beta_4 Sz_{it} + \beta_5 D1_{it} + \varepsilon_{it}$ at cut off 10% Table 2 contains the results of control rights influence to earnings management. Measurement of various variables is ABSDA (absolute discretionary accruals = total accruals - nondiscretionary accruals, HK (control rights = direct HK (percentage of direct ownership of controlling shareholder + indirect HK (sum of the minimum ownership at every chain ownership), LND (earnings nondiscretionary = accounting earnings - discretionary accruals, LEV (leverage) = total debt / total asset, Sz (size of the firm = total logarithm of asset, $D1 = 1$ for the residual out of the normality and 0 other.

According to Kim and Yi (2006), divergences between control rights and cash flow right is an incentive

for controlling shareholder to expropriate the company's asset for private benefit. It is suffered to noncontrolling shareholders. To hide private benefit, controlling shareholder chooses the method and accounting policies hiding expropriation. According to Gugler and Yurtoglu (2003), higher cash flow right leverage is incentives and opportunities for controlling shareholder to expropriate noncontrolling shareholders. Therefore, the condition supports controlling shareholder to manage earnings. The results of this research are consistent with Haw's et al. (2003) and Kim and Yi's study (2006).

Haw *et al.* (2003) document that earnings management is influenced by wedge between control rights and cash flow rights in countries with low protection of noncontrolling shareholders such as Indonesia. Kim and Yi (2006) also document that controlling shareholder tends to manage earnings when high control rights and low cash flow rights. Kim and Yi (2006) document controlling shareholder manages earnings to hide his/her self-serving behavior and to avoid the other consequences such as discipliner judgments. It is happened when wedge between control rights and cash flow rights are large. With domination control rights to cash flow rights, controlling shareholder exploits company's asset so value of the firm decreases. The decreasing of company's financial condition motivates cash flow right leverage of controlling shareholder to manage earnings opportunistically through increasing earnings. The results are consistent at cutoff 20% at Table 3 and 30% at Table 4.

CONCLUSION

Based on the analysis, this study concludes that higher cash flow right leverage motivates controlling shareholder to manage earnings. The conclusion implicates entrenchment effect. The private benefit is benefit obtained by controlling shareholder through expropriation. The private benefit is not easy to be measured.

This research does not measure the private benefit motivating controlling shareholder to manage earnings. The results of this research will be more robust if private benefit is measured. If activity of expropriation is documented, private benefit will be easy to be measured. The limitation of this research is lower generalization for the results of this research. Samples in this research are companies in manufacturing industry. This research can not combine manufacturing companies and nonmanufacturing companies. Accruals in nonmanufacturing companies are less than manufacturing companies.

The future research can improve the limitations of this research. The future research can measure private benefit. The future research can consider good corporate governance in Indonesia. The good corporate governance is expected to prevent expropriation and opportunistic earnings management. The future researchers can research the role of independent commissary to prevent the expropriation by controlling stockholder. Future researcher can use nonmanufacturing companies. It is conducted to represent whether the results of this research is still consistent.

ECHO ARTMAP: CONTEXT SENSITIVITY WITH NEURAL NETWORKS IN FINANCIAL DECISION-MAKING

Charles Wong, Boston University
Massimiliano Versace, Boston University

ABSTRACT

Context modifies the influence of any trading indicator. Ceteris paribus, a buyer would be more cautious buying in a selling market context than in a buying market. In order for automated, adaptive systems like neural networks to better emulate and assist human decision-making, they need to be context sensitive. Most prior research applying neural networks to trading decision support systems neglected to extract contextual cues, rendering the systems blind to market conditions. This paper explores the theoretical development and quantitative evaluation of context sensitivity in a novel fast learning neural network architecture, Echo ARTMAP. The simulated risk and cost adjusted trading results compare very favorably on a 10-year, random stock study against the market random walk, regression, auto-regression, and multiple neural network models typically used in prior studies. By combining human trader techniques with biologically inspired neural network models, Echo ARTMAP may represent a new tool with which to assist in financial decision-making and to explore life-like context sensitivity.

INTRODUCTION

Stock prices refer to the latest mutually decided transaction price and time between a voluntary buyer and seller. If the stock prices over time are increasing, they indicate that the buying interest exceeds the selling interest. This signals a bullish or optimistic market context favorable to investment, all else equal. A successful trader (Schwager, 1994) often considers the underlying market sentiment when making decisions. This sensitivity to context in decision-making is one of the hallmarks of human intelligence (Akman, 2002).

Human subjects often treat similar tasks differently under different contexts (e.g. Carraher, Carraher, & Schliemann, 1985; Bjorklund & Rosenblum, 2002). Working memory allows features to be tracked over time to extract a context (Kane & Engle, 2002; Baddeley & Logie, 1999). Context sensitivity theoretically enables the decision-maker to disambiguate different feature inputs that may be identical at single points in time (Kane & Engle, 2002).

To better model human decision-making with context sensitivity, an automatic decision system must be context sensitive (see Figure 1, left). Tracking the price over time to determine whether the market is uptrending (bullish) or downtrending (bearish) intuitively provides contextual cues (Schwager, 1994).

Neural networks are biologically inspired, automated, and adaptive analysis models that can better accommodate non-linear, non-random, and non-stationary financial time series than alternatives (e.g. Lo, 2001; Lo & Repin, 2002; Lo, 2007; Gaganis, Pasiouras, & Doumpos, 2007; Yu, Wang, & Lai, 2008). Much research in the past decade applies them to financial time series with typically strong and compelling empirical results. Table 1 summarizes our survey of 25 studies published in the past decade (Wong & Versace, 2010a).

Figure 1: One-year daily prices for the Dow Jones Industrial Average

Figure 1: One-year daily prices for the Dow Jones Industrial Average. (left) Identical point inputs (the horizontal line indicates same price) lead to different classes. The boxes show different contexts that can disambiguate the two inputs. (right) Identical short duration inputs (small boxes) lead to different classes. The longer duration input (large green boxes) can disambiguate the two inputs.

Table 1: Survey

	Slow Learning	Fast Learning
<u>Context Blind</u>	(14) - Outperforms	(9) - Outperforms
<u>Context Sensitive</u>	(6) - Outperforms	(0) - N/A

Table 1: A survey of 25 studies that applied neural networks to financial stock time series analysis over the past decade, divided into network learning rules (slow or fast) and context sensitivity. Instances and their typical results vs. the market are included.

Two trends appear to be dominant from Table 1. First, neural networks appear to outperform the market, which is typically defined as a random walk or buying-and-holding of an index. Second, the results appear robust regardless of network learning rule or context sensitivity. The bias towards slow learning networks in Table 1 probably reflects their earlier availability (Rumelhart, Hinton, & Williams, 1986). Of the six studies able to track context via temporal sensitivity as in Figure 1, all relied on slow learning rules incorporated in Jordan and Elman networks (e.g. Versace et al, 2004; Yu, Wang, & Lai, 2008; Freitas, Souza, & Almeida, 2009; Jordan, 1986; Elman, 1990). Studies directly comparing fast learning, slow learning, and slow learning context sensitive networks have found no significant differences in empirical results (e.g. Saad et al, 1998).

This paper explores the disagreement between the intuition supporting the importance of context sensitivity and the empirical results (Table 1) showing no differential benefit relative to existing neural network models. Table 1 indicates existing models tend not to incorporate fast learning with context in finance. Therefore, this paper introduces a novel context sensitive fast learning network for transparent analysis (Moody & Darken, 1989; Carpenter, Grossberg, & Reynolds, 1991; Parsons & Carpenter, 2003). The base fast learning component model is ARTMAP (Amis & Carpenter, 2007) from the Adaptive Resonance Theory class of models. While ARTMAP is not a perfect blend of all existing fast learning characteristics (e.g. it differs in learning vs. Radial Basis Function networks), it can be regarded as a general purpose, default network that automatically adapts and scales its topology to a generic dataset (e.g. Carpenter, 2003). For this paper, benchmarks include random walk, regression, auto-regression, a slow learning backpropagation (Rumelhart, Hinton, & Williams, 1986), a fast learning ARTMAP (Amis & Carpenter, 2007), and a slow learning context sensitive model (Jordan, 1986).

The remaining sections of this paper divide as follows: Section II provides a brief review of the ARTMAP kernel mechanism as a base for later extension; Section III demonstrates how to theoretically adapt the ARTMAP to context sensitivity; Section IV outlines the quantitative experimental setup and evaluation; Section V provides the results and discussion; and Section VI contains concluding remarks.

KERNEL REVIEW FOR A TYPICAL FAST LEARNING MODEL: ARTMAP

Slow learning networks possess hidden layers that have opaque representations relating inputs to outputs. In contrast, fast learning allows immediate and transparent convergence for independent storage layer nodes. ARTMAP is a type of fast learning network that was inspired by biological constraints and can be adapted to a variety of uses. Extensive literature shows its capabilities and interprets its mathematical bases (e.g. Amis & Carpenter, 2007; Parsons & Carpenter, 2003). Figure 2 (left) shows the default ARTMAP flow diagram.

Figure 2: (Left) a Default ARTMAP Network Diagram Showing The Three-Layer Architecture and Circles Represent Individual Components of the Pattern (Right)

Figure 2: (left) A default ARTMAP network diagram showing the three-layer architecture. For a particular input pattern, \bar{X} , the ARTMAP kernel finds the most similar stored pattern, \bar{W}_j , which maps to a specific output node. Boxes, or nodes, represent patterns (responses in the output layer) and circles represent individual components of the pattern. (right) An example of the ARTMAP kernel calculating the similarity between an input pattern and a single stored pattern. See the text for details.

There are three layers in the default ARTMAP network. The input layer receives input patterns, each represented by a vector with one or more components, \bar{X} . Given this vector, the network finds the most similar vector \bar{W}_j from the storage layer, where $j = \{1..J\}$ and J is the number of storage nodes. The output layer node associated with the most similar storage node dictates the network response. The ARTMAP kernel, which is a function that determines the similarity between vectors (Bishop, 2006), models pattern recognition as per equation (1):

$$T_j = |\bar{X} \wedge \bar{W}_j|, \quad (1)$$

where T_j is the similarity score for storage node j . The kernel procedure has four steps: normalize all vector component values to between 0 and 1; complement code both vectors such that $\bar{X} = (x_1, 1 - x_1)$; apply the fuzzy min operator (\wedge) on the vectors; and sum ($||$). For example, given a normalized input value of 0.5 and a particular normalized storage node of 0.7, the complement codes would be (0.5, 0.5) and (0.7, 0.3). The fuzzy min would be the lesser of each component, or (0.5, 0.3) and their sum would be 0.8, which as a normalized value can also be read as 80% similar. The default ARTMAP learning

rules that update and add storage layer nodes with their associated output nodes are not modified and are not treated here. For references on previously published ARTMAP models, please see <http://techlab.bu.edu>.

The following section provides the theoretical modifications to this kernel.

EXTENDING ARTMAP TO EXTRACT CONTEXT: ECHO ARTMAP

The approach taken here explores fast learning network rules with context sensitivity. Figure 3 shows how a fast learning ARTMAP model can be modified to process time patterns in the data with three steps via input delays, decays, and output-to-input recurrence to create the novel Echo ARTMAP model.

Figure 3: Learning ARTMAP Model

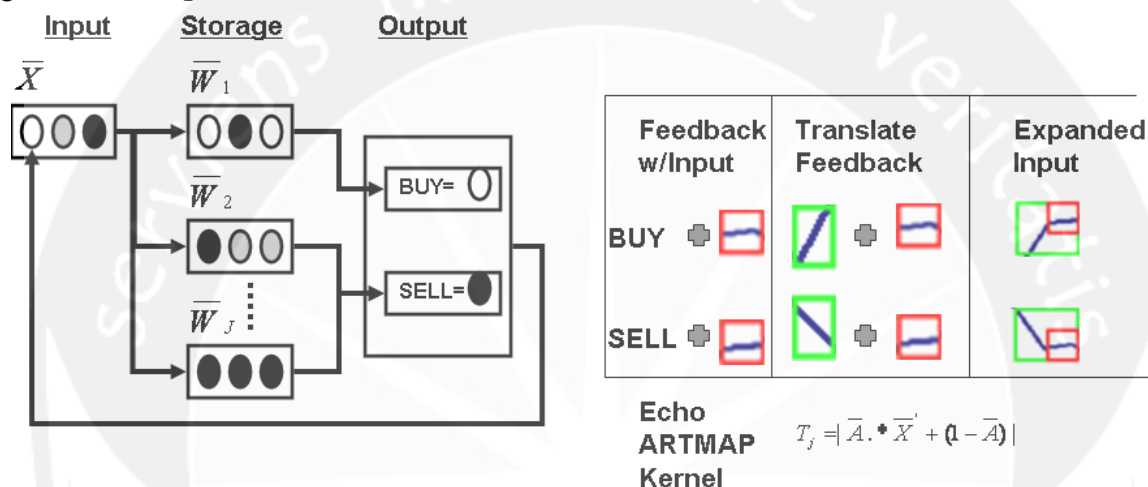

Figure 3: (left) The full Echo ARTMAP architecture with time delay, decay, and recurrence. See text for the breakdown of the three steps. (right) Excerpted from figure 1, the feedback provides additional input information from past storage values. Translating the feedback back into its component pattern allows more information to be input into the network. This example assumes the patterns in Figure 1, left, have already been stored, for instance allowing the feedback Buy value to be translated into an uptrend. This process can be repeated infinitely, allowing greatly expanded inputs.

Figure 4: The Influence of Past Inputs at Time t .

Figure 4: The influence of past inputs at time t . (a) At time t , a model with no time delay only considers the current input from t . (b) A model with a delay of 2 considers both the input from t and the past two inputs equally. (c) A model with delay of 2 with decay considers the input from t and the past two inputs, but with more emphasis on more current inputs. (d) A model with delay of 2 with decay and output-to-input recurrence theoretically considers all prior inputs albeit with very little emphasis on distant inputs in time.

Implementing input time delays allows an ARTMAP network to model one aspect of working memory. Figure 3 (left) shows the ARTMAP network from figure 2 with multiple components in each node, the

right two being the same feature at different points in time. Similarity proceeds from equation (1), but depends on multiple points in time. Figure 4 (a and b) compares the influence of a given input over time when introducing input time delay. With no delay, the network at time t can only consider inputs from time t .

Implementing time decay allows an ARTMAP network to model a more complex, non-stationary working memory. In a non-stationary data set, proximal points in time should have more influence than distal points in time (Hamilton, 1994). The underlying state or context is shifting over time, such that feature values within the current state are more relevant. Equation (2) shows how to scale the contextual importance:

$$T_j = |\bar{A} \cdot \bar{X}' + (1 - \bar{A})|, \quad (2)$$

where $\bar{X}' = \bar{X} \wedge \bar{W}_j$, or the component-wise collection after the first three steps in equation (1), $\bar{A} = (a_1, a_2, \dots, a_M)$, $0 \leq a_m < \infty$, a is monotonically decreasing with m , $m = \{1..M\}$, and M is the number of time delays. The (\cdot) operator indicates an array multiplication that performs element-by-element factoring. The vector \bar{A} scales the importance of the components of \bar{X}' . Figure 4 (c) shows the scaling effect of monotonically decreasing A components as the influence of inputs from time t diminishes after time t . The $(1 - \bar{A})$ term ensures the T_j score has a maximum of 1. Although negative scores are possible, the default ARTMAP matching rule selects the highest positive T_j score (Amis & Carpenter, 2007).

Finally, implementing output-to-input recurrence is useful since it allows a compressed version of past inputs (i.e. as implied by the output decision based on these inputs) to remain available to influence decisions at future times. For example, a fixed small window in time may not fully capture a large pattern (Figure 1, right). A fixed large window captures non-pattern noise that leads to over-fitting. Output-to-input recurrence can simulate a dynamic window size. Figure 3 (right) shows a short pattern preceded by a recurrent output label. Since each output label associates with a specific storage pattern, using the label as a further input creates sensitivity to patterns that are composites of past short window patterns as needed, generating the profile in Figure 4(d). This combines the flexibility of long windows with the lower susceptibility to over-fitting of short windows. The novel Echo ARTMAP model performs this implicit composition of past inputs.

QUANTITATIVE TESTING OF ECHO ARTMAP

Figure 5 shows the overall study framework for collecting and evaluating benchmark performance via risk-adjusted rates of return for the Echo ARTMAP network and benchmarks.

This study randomly selects five stocks from the Dow Jones Industrial Average index as of 1999 (American Express, Exxon-Mobil, IBM, JP Morgan Chase, and United Technologies Corporation) for daily online training spanning ten years from 2000-2009. This generates 12,500 sample data points, which exceeds the sample size required for 95% confidence given estimated population standard deviation under both normal and non-normal assumptions (Higgins, 2004). Online means the fast learning networks continually expand their training set after testing on each trading day; the slow learning networks replicate this process by using rolling training window sizes of two years and averaging the results. Supervised classes derive from whether the forward one-day price change is positive, negative, or neutral. The single input feature uses a moving average period of 10 days subtracted from the current price. From this single feature, each benchmark model receives up to an 11-dimensional derived input set

for each stock: 10 input delays from the single feature plus one from the benchmark's output-to-input recurrence where applicable.

Figure 5: The Outline Process Flow for Evaluating the Echo ARTMAP and Benchmarks

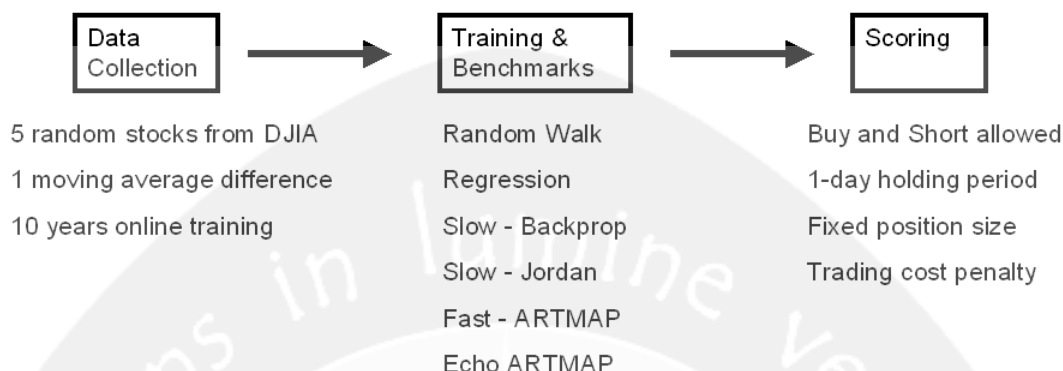

Figure 5: The outline process flow for evaluating the Echo ARTMAP and benchmarks. Data collection proceeds from <http://finance.yahoo.com>. This study uses ten years of online training. One moving average difference with the price provides the basic input. Trading costs and risk adjustment are included in fixed trading sizes (no trades are assumed to yield zero percent; gains and losses are replaced to maintain fixed trading size).

The benchmarks include: an industry standard random walk; regression and auto-regression (Box & Jenkins, 1970); a slow learning static input neural network, backpropagation (Rumelhart, Hinton, & Williams, 1986); a fast learning static input neural network, ARTMAP (Amis & Carpenter, 2007); a slow learning context sensitive neural network, the Jordan network (Jordan, 1986); and the novel Echo ARTMAP fast learning context sensitive network.

For scoring purposes, buying, not trading, and selling short are allowed (i.e. 3-class predictor). Each decision lasts for one day. Position sizes are fixed, with gains being removed and losses being replaced. Not trading is valued at zero gains and zero costs. Round trip trading costs deduct 0.1% per active trading decision. To counter this trading cost, the supervised learning classifies trading days with daily variance of less than 1% as not trading. In addition, the Sharpe Ratio (Chartered Financial Analyst Institute, 2010) divides the average return by the standard deviation of the returns. This provides an additional, singular, and objective measure of the risk/reward profiles for each benchmark.

RESULTS AND DISCUSSION

Figure 6 shows the six benchmarks' average annualized performance over five random Dow Jones Industrial Average stocks over ten years. For reporting purposes, the ten-year period divides into three periods of 3.33 years each to demonstrate a possible range of results. The Sharpe Ratios provide single, numerical measures of risk and reward for each benchmark.

Trading costs penalize each trade, which accounts for the random walk having a slightly negative annual rate. Without trading costs a random walk should consistently generate near zero average gains due to perfect hedging of buying and shorting. In agreement with Yu et al. (2008), the regressive benchmarks both had more difficulty than neural networks due to the non-linear nature of financial time series data and the penalties incurred from the trading costs. Results are combined in figure 6 for simplicity since both benchmarks had similar performance. In agreement with Saad et al. (1998) and Table 1, the Slow-Backprop (backpropagation), Slow-Jordan, and Fast-ARTMAP networks all had similar risk-adjusted performances that outperformed the random walk. The networks can generate high gains, but the transaction costs and the volatility reduce much of the benefits. The prior studies that contributed to Table 1 did not typically include transaction costs or risk adjustment in their analyses.

Figure 6: The 10-Year Financial Data Set Annualized Gains per Benchmark

Figure 6: The 10-year financial data set annualized gains per benchmark. The 10-year average for each benchmark is broken into three equal reporting periods for further granularity. Regression and auto-regression provided similar results and are combined for simplicity. All results include trading costs. The Sharpe Ratio is the average return divided by the standard deviation of returns. Typical mutual fund Sharpe Ratios range from -1.7 to 2.5 per www.morningstar.com.

The novel Echo ARTMAP network strongly outperformed all other benchmarks on the sample of five stocks, with a mean 10-year annual gain net of costs of 9% and a Sharpe Ratio of 1.5. This quantitatively shows that neural network topology can have significant empirical effects and that adding context can greatly improve fast learning neural network performance on financial decision making.

CONCLUSION

In a financial time series, decision makers are best served by being cognizant of past and current indicators. This builds context into trading decisions. For automated systems like neural networks to emulate and assist in the decision-making process, they should be context sensitive. For neural networks to be adaptive and reactive to fluid changes in the environment, they should also rely on fast learning rules. The novel, fast learning context sensitive Echo ARTMAP can quickly and transparently incorporate the current market conditions into its decisions. Echo ARTMAP empirically outperforms the benchmarks ranging from autoregression to context sensitive slow learning Jordan to fast learning ARTMAP networks on randomly selected stock data over ten years of varying market conditions. While context-blind models cannot modulate their decisions based on extant environments and slow learning models react very slowly and poorly to ever-changing environments, the theory behind the enhancements in a fast learning, context sensitive model supports the Echo ARTMAP empirical findings. This supports the concept of working memory as a means of extracting the context that disambiguates feature inputs over time and leads to more intelligent decision-making.

FASHION FOR SUSTAINABILITY: A MULTI-PRONG APPROACH TO MARKETING RECYCLED TEXTILES

Kenny K. Chan, California State University, Chico
Zack Treanor, California State University, Chico

ABSTRACT

The textile recycling industry saves billions of pounds of postconsumer textile waste from ending up in landfills every year. While a small percent of the recycled clothing are shipped off to markets in developing nations, a huge amount sits in warehouses waiting for a second life. Many firms have heightened their sense of corporate social responsibility and have been investing to research sustainable apparel. Manufacturers and retailers with policies to consider their triple bottom lines -- not just profit but the planet and its people, are poised to see big gains in the future. Unfortunately, consumer awareness of, and demand for clothing produced from recycled textiles are still in their infancy. Interventions are needed to reverse consumers' hunger for cheap fashion, and to educate them on the environmental benefits of man-made and recycled fibers. To achieve a high degree of buy-in, it is equally important to create win-win proposals that benefit all players in the supply chain. More research will be needed to create alternative materials that are functionally equivalent to virgin fibers in terms of quality and cost effectiveness. Policymakers and industry leaders must step up to broaden the requirements and appeal of low-cost, recyclable fabrics made from eco-conscious practices.

COMPARISON OF THE EVA EFFECT TO OCF AND EPS ON MV OF LISTED COMPANIES ON THE TSE

Zahra Lashgari, Islamic Azad University Central Tehran Branch
Akbar Javadian Kootanaee, Islamic Azad University Firuzkooh Branch

ABSTRACT

One of the most important goals of a business unit is creating value and wealth for its shareholders and attracting them for more investment. The success of management, and consequently the success of the business unit, is measured by the level of value created for its shareholders.

Economic Value Added is a performance measure that is in essence related to the market value of a firm. This measure focuses on the ability of business organizations to create return beyond cost of shareholders equity based on certain risk.

In this research, the interrelationship between EVA, Cash Flows, and Earning per Share is examined to find the best measure of business organizations performance. The reason for choosing traditional measures as Earning per Share and cash flow generated by operations is the high concern for profit-making and liquidity in firms.

The time period is between 2005 and 2009, and studied firms are listed companies on the Tehran Stock Exchange. In addition, a linear regression model is used for panel data, and analysis is done using Eviews. The results of the research show that EVA comparison to OCF and EPS is a more efficient measure than MV.

KEYWORDS: Economic Value Added (EVA), Net Operating Profit after Tax (NOPAT), Operating Cash Flow (OCF), Weighted Average Cost of Capital (WACC)

INTRODUCTION

Value creation for shareholders has become a concern of management, and has become one of the most important goals of business organizations. Management considers whether and which variables help in value creation. The main question is determining the best measure for assessing the performance of economic institutions to help investors find appropriate investment opportunities and to help managers create value for the firm. So far there have been developed various performance evaluation measures, among them Economic Value Added (EVA) is one of the last. Using EVA, the economic profit of a firm can be measured, reducing criticism against accounting profit. As EVA considers all costs of capital, it eliminates the problem of considering only debt costs and therefore showing higher profits than otherwise.

EVA takes into account the opportunity cost of all resources, showing optimum resource allocation, value creation and shareholder wealth. Once resources are allocated efficiently, the opportunity cost of resources is eliminated and shareholder value is created, resulting in profit and a return on investment.

LITERATURE REVIEW

Economic Value Added

For many years economists believed that a business organization must earn more than its cost of equity in order to keep and develop its operations. In the 20th century this concept obtained an operational status and came to be called Residual Income. General Motors applied this concept in the 1920s. In 1965 Solomon's proposed RI as an internal measure of performance evaluation for business organizations, and in (1973, 1982), R. Anthony proposed it as an external measure of performance evaluation (Biddle et al, 1999).

One type of residual income calculation is called Economic Value Added. EVA was developed by the consultation firm of Stewart & Co., and is a registered trademark of that firm. The calculation of EVA includes a deduction for the cost of capital, and also adjusts accounting income to more accurately reflect the economic effect of transactions and the economic values of assets and liabilities. In general, these adjustments move the income calculation further from the reliability end of the relevance – versus-reliability continuum, and closer to the relevance-end of that continuum. Since the 1990s, EVA has helped revive the popularity of residual income. However, it should be emphasized that obtained trademark potential on the term “EVA,” “the concept of residual income precedes EVA by almost half a century, and it is in the public domain (Caplan, 2009).

In a 1994 research address published in the Harvard Business Review, Stern Stewart stressed that "EVA is the best wealth making measure and it outperforms accounting based measures in determining shareholders wealth." The same year, the Jenkins Committee of the AICPA proposed that, to improve financial reporting, those companies that use EVA as their internal performance evaluation, should use it as their external measure as well (Biddle, 1997).

EVA is defined as net operating profit after tax (NOPAT), which is reduced by cost of capital. Cost of Capital includes all financing expenses which are included in the Weighted Average Cost of Capital (WACC).

The formulation of EVA is as below:

$$EVA = NOPAT_t - WACC_t(Capital_{t-1}) \quad (1)$$

NOPAT is the net operating profit after tax at the end of period t

WACC is the weighted average cost of capital

Capital is the book value of total capital at the end of period t-1

As inferred from the formula, value drivers in EVA are classified into NOPAT, WACC and Capital. (Stewart, 1991) There are two operating and financial perspectives with which to compute Capital and NOPAT results in the same end. Below, each approach is summarized.

Based on operating perspective, Capital and NOPAT are computed as follow:

Based on financial perspective, NOPAT and Capital are computed in three steps in which

First step is elimination of liability effect. In this step all debt, present value of debt, and interest charges of liabilities, including interest on loans, are added back to accounting profit.

Next step is elimination of other financial deviation effects. To improve interest, elimination of financial deviation effects is critical. In this step, capital provided by preferred shareholders and minority interest is added back to capital, and profit allocated to these suppliers is added back to NOPAT.

Table 1: Calculation of Capital and NOPAT (Operating Viewpoint)

Capital		NOPAT	
Net working capital (NWC)	XX	Net sales	XX
Net fixed asset (NFA)	XX	CGS	(XX)
Other assets	XX	Operating costs	(XX)
Other capital equivalents	XX	Operating profit	XX
CAPITAL	XX	Other incomes (costs)	XX
		Increase in shareholders equity	XX
		Tax	(XX)
		NOPAT	XX

NWC = Current asset – (Current liability – interest bearing liabilities)

Interest bearing liabilities = Short-term facilities from banks – sales receivable

NFA = book value of fixed income – Accumulated Depression (AD)

Last step is elimination of accounting deviations. Account deviations are removed by adding back the equity equivalent to capital and periodical changes to NOPAT. Referring to the above mentioned steps, the calculation of cost of equity capital, based on financial perspective, is summarized as follow:

Table 2: Calculation of Capital and NOPAT (Financing Viewpoint)

Capital		NOPAT	
Common equity	XX	Net profit	XX
Preferred equity	XX	Preferred dividend	XX
Minority interest	XX	Minority interest provision	(XX)
Interest bearing liabilities	XX	Interest expense after tax	XX
Equity equivalent	XX	Increase in equity equivalent	XX
CAPITAL	XX	NOPAT	XX

Cost of Capital

Each firm has its own risks and rates of return. Each group of investors, like holders of bonds, and preferred and common stock, seek a return proportional to risk taken. Cost of capital is the lowest rate of return a firm must obtain in order to secure its investors' return (Neveu, 1986).

Cost of capital is significant from various aspects, including its applicability in making optimal capital structure decisions, and its use in debt and performance measures and in discounting future cash flows in valuation. Furthermore, ignorance of the cost of equity capital in calculation of net profit justifies the necessity of focusing on this subject.

Cost of capital includes components of capital that construct the sum of the capital structure. The main components of capital structure are debit, preferred stock, common stock and retain earnings. Since each holder of the mentioned financial resources has its own expectation for rate of return, the cost of acquiring each item is different. Further, due to their varied nature, the calculation method for their cost of capital is varied. In order to determine a firm's cost of capital, it is necessary to calculate the cost of every component of capital separately and based on their proportion in capital structure. : (Neveu, 1986). Thus the average cost of capital is computed as follows:

$$WACC = \left(\frac{D}{D+E} \right) K_d + \left(\frac{E}{D+E} \right) K_e \quad (2)$$

Where:

D is the total debt

E is the total shareholder's equity

K_e is the cost of equity

K_d is the cost of debt

Cash Flow Statement

Cash flow statements indicate cash inflows and cash outflows during a given time period. When used with other financial statements, this information helps investors, creditors and others to determine the credit rating of a firm. For example, cash resulting from the issuing of bonds shows whether a firm is not only liable to pay its interest rate, but also whether it must pay the deposit at particular due date. Therefore, the cash flow statement is useful in analyzing the past and future rate of return of a firm, and its ability to pay back its debts (Warren. et al. 2004)

DATA AND METHODOLOGY

In general, information sources, including information related to Tehran Stock Exchange, consists of annual financial statements and accompanying notes present in TSE. Furthermore, required statistical information of companies is collected and analyzed using the "TADBIR PARDAZ" software and stock exchange data base.

Research Design

To be included in the sample, the firm had to satisfy the following criteria:

1. The firm must be listed on the Tehran Stock Exchange before 2005,
2. The firm's initial data must have been submitted to the Tehran Stock Exchange for 5 continues years,
3. The firms in certain industries are systematically excluded because of the component data requirements (i.e. banks and insurance companies).

In this research, the total number of listed companies by the end of the year 2009 are 346 companies from 37 various industries. After the above adjustments, among these 346 companies, 117 remained, and with respect to the sample volume described below, a categorized random sampling method is used.

Research Model

In this research, the goal is to forecast changes in the dependent variable (market value) based on the independent variables- EVA, EPS, operating cash flow (OCF) and a simple linear regression is applied, the general equation is as below:

$$Y = \beta_0 + \beta_1 X_1 + \varepsilon \quad (7)$$

In order to answer the questions, a linear regression model for panel data is used, and data are analyzed using EViews 6. The regression formula applied for panel data is presented below:

$$MV_{it} = \alpha_i + \beta_1 EVA_{it} + \beta_2 CFO_{it} + \beta_3 EPS_{it} + \varepsilon_{it} \quad (8)$$

$i = 1, 2, \dots, N$

N = number of cross sections in panel data, which in this research is equal to the number of firms.

$t = 1, 2, \dots, T$

T = time period

The equation accomplished is as follows:

$$MV(x) = C(x) + PER_EFFECT + C(1) + C(2) * CFO + C(3) * EVA + C(4) * EPS \quad (9)$$

Where MV = Market of Values.

The output of the company=latitude from company reference + latitude from a temporal reference + latitude from a common reference + coefficient of a common angle in any variable for all companies.

In the next step, for the purpose of the F test and the t test, there is a need to test for the independence of the error hypothesis for which we use the Durbin-Watson test.

Research Hypothesis

Theoretical principles and recent researches lead to the following hypothesis (stated in alternative form):

- 1) The EVA effect is greater than that of OCF on the market value of listed companies on the Tehran Stock Exchange.
- 2) The EVA effect is greater than that of EPS on the market value of listed companies on the Tehran Stock Exchange.

EMPIRICAL RESULT

This study primarily presupposes both cross-section and time series effects as fixed, then calculates the rates of changes based on companies, time and common interests, and decides through a Flasher test whether the equation is significant. Thereafter, this study begins to identify the level of amplitude error of each of the variables to find if it has any effectiveness or significance.

This study again presupposes both cross-section and time series randomly, and continues to exercise the studies as mentioned above. To ensure that the above said effects are correct, we pose both cross-section and time series as random, and use the Hausman test. Based on the Hausman test, the first method, that of a fixed presupposed cross-section and time series, is correct because the figure for Prob₀, or significance of variables in the Hausman test, is larger than 0.05.

Table3: Sums of The Hausman Test

Correlated random effects – Hausman test			
Pool :Test			
Test cross-section and period random effects			
Test summary	Chi-sq .statistic	Chi-sq .d.f.	Prob.
Cross-section random	0.000000	3	1.000
Period random	0.000000	3	1.000
Cross-section and period random	0.000000	3	1.000

Test of Hypothesis 1

Null hypothesis (H_0): EVA and OCF have no meaningful effect on the market value of listed companies on the Tehran Stock Exchange.

$H_0: \rho =$

Alternative hypothesis (H_1): EVA and OCF have a meaningful effect on the market value of listed companies on the Tehran Stock Exchange.

$H_1: \rho \neq$

Table 4: statistical results from the test of hypothesis 1 (Period and Cross-section are Fix)

Period	Cross-section	Coefficient		Prob.		Prob)F-statistic(R-squared
		EVA	OCF	EVA	OCF		
	Fix	-0.00509	5.05E-05	0.0414	0.9473	0.00000	0.54337

Table 5: statistical results from the test of hypothesis 1 (Period and Cross-section are Random)

Period	Cross-section	Coefficient		Prob.		Prob)F-statistic(R-squared
		EVA	OCF	EVA	OCF		
	Random	-0.000122	0.000162	0.9488	0.7468	0.058659	0.020702

As already established, relying on the Hausman test, the second test is not valid and thus we shall start to analyze the results as obtained in Table 4 in order to deal with the fixed theory of cross-section and time series. Considering the figure for the test error level, the test error of the Fisher test is significant as its figure is a 0.05 digit. Thus, we can proceed to analyze next steps of test. In continuation, as already mentioned, the variable EVA on MV has a significant impression, as the significant figure of this variable is equal to 0.0414, which is smaller than the established meaningful level of 0.05. Therefore, it can be said that EVA, in its connection with MV, is a more effective and efficient measure than (OCF).

Test of Hypothesis 2

Null hypothesis (H_0): EVA and EPS have no meaningful effect on the market value of listed companies on the Tehran Stock Exchange.

$H_0: \rho =$

Alternative hypothesis (H_1): EVA and EPS have a meaningful effect on the market value of listed companies on the Tehran Stock Exchange.

$H_1: \rho \neq$

Table 6: statistical results from the test of hypothesis 2 (Period and Cross-section are Fixed)

Period	Cross-section	Coefficient		Prob.		Prob(F-statistic)	R-squared
		EVA	EPS	EVA	EPS		
	Fix	-0.00509	-0.12833	0.0414	0.0234	0.00000	0.543379

Table 7: statistical results from the test of hypothesis 2 (Period and Cross-section are Random)

Period	Cross-section	Coefficient		Prob.		Prob)F-statistic(R-squared
		EVA	EPS	EVA	EPS		
	Random	-0.000122	-0.01549	0.9488	0.0068	0.058659	0.020702

Again, as established by the Hausman test, the second test is invalid and thus allows us to deal with the analysis of results as obtained in Table 6. The test is significant as noted in the figure representing the

level of Fisher's test error, because its value is less than 0.05 and thus we can analyze the next steps of test.

It is, therefore, noted that both variables EVA and EPS have significant effects on MV, because the significant values in both variables are less than the significant level of 0.05. It is, however, to be said that EVA has a significant value of 0.0414, which approaches the significant level of 0.05 and indicates that EVA affects MV more than EPS.

In addition, the adjusted R square is equal to 0.543, which shows that 54.3 percent of MV are explained by EVA and EPS . .

CONCLUSION

Each business unit must evaluate weaknesses of previous actions for its operation's continuity and to enable it to choose the right procedures and desired policies. In this regard, strategic management also is in need of planning and resource allocation to find the optimum breakeven point among its resources in existing opportunities. In this research, the interrelationship between EVA, cash flows, and earning per share is studied to find the best measure of business organizations performance. It is concluded that both variables EVA and EPS have significant effects on MV. Furthermore, the result shows that EVA, in connection with MV, stands as a more efficient index than EPS.

TRANSFORMATIONAL LEADERSHIP IN LAS VEGAS CASINO-GAMING MANAGERS

Gregory W. Goussak, University of Southern Nevada

Jon K. Webber, University of Phoenix

ABSTRACT

Leadership is one of the most widely researched topics of the 20th century while being one of the most misunderstood as well (Burns, 1978; Chang, 2005; Masood, Dani, Burns, & Backhouse, 2006). The difficulty in defining the most effective style of leadership is two-fold. First, leadership lacks a common definition. Throughout the past century, scholars could only agree to disagree on a common definition of leadership in a successful organization (Antonakis, Cianciolo, & Sternberg, 2004). The second issue of concern reflects the ever-changing environment of 21st century organizations (Kupers & Weibler, 2006).

As the casino-gaming industry continues to grow, the understanding of leadership styles becomes even more important because of competition and economic challenges. The purpose of this research study was to examine employee perceptions of managerial leadership styles in Las Vegas casino-gaming operations in conjunction with revenue growth between 2000 and 2006. Participants in the current research study completed the Multifactor Leadership Questionnaire Form 5X (MLQ) to express their perceptions about the leadership styles of casino-gaming managers. The study revealed that Las Vegas casino-gaming employee participants perceived their managers as following a transactional rather than a transformational style of leadership. In addition, revenue growth was not seen as a determining factor in how employees viewed their manager's leadership style.

INTRODUCTION

Leadership is one of the most widely researched topics of the 20th century while being one of the most misunderstood as well (Burns, 1978; Chang, 2005; Masood, Dani, Burns, & Backhouse, 2006). Antonakis, Cianciolo, and Sternberg (2004) claimed that the changing leadership paradigms explained a portion of the 20th century's long confusion related to the study of leadership. The difficulty in defining the most effective style of leadership is two-fold. First, leadership lacks a common definition. Throughout the past century, scholars could only disagree on what the term means (Antonakis et al.). The second issue of concern reflects the ever-changing environment of 21st century organizations (Kupers & Weibler, 2006). One factor believed to play a significant role in the changing environment concerns how emotions play an important role between how leaders and followers relate to one another (Kupers & Weibler).

The study of leadership over the early portion of the 20th century tended to disregard emotions as unimportant distractions (Kupers & Weibler, 2006). Kupers and Weibler believed ignoring emotions was a critical error on the part of leadership scholars; only recently does the literature account for the affect emotions play in the influence leaders have over their followers. The study of 20th century leadership initially focused on the characteristics or styles of leaders as perceived by the environment. The differences between leaders and non-leaders also raised the primary weakness of the Trait School of Leadership. Perceived leadership rely on individual opinions often resulting in negative descriptions preventing an accurate description of leadership (Antonakis et al., 2004).

As the study of leadership progressed from the late 20th century and into the early 21st century, the complexity of analysis increased (Antonakis et al., 2004). Antonakis et al. believed that the study of leadership no longer focused its impetus on individual traits or characteristics. Leadership research of the 21st century focuses on the transformation of an organization from being results-orientated leadership to

one interested in the success of individuals and the organization (Antonakis et al.). According to Hack and Roberts (2003), transforming an organization involves changing the approach taken towards defining and measuring organizational performance.

An important part of assessing key skills in hospitality leaders is the ability to understand and effectively deal with change (Brownell, 2005; Van Wart, 2004). According to Van Wart (2004), the analysis of leadership must focus on how “[leadership] varies significantly from one situation to the next” (p. 173). An example of the constant variation of situations found in the casino-gaming industry began in 1976 when casino style gaming in Atlantic City, New Jersey was legalized and was further expanded with the Indian Gaming Regulatory Act of 1988 (Wenz, 2006). Van Wart’s (2004) analysis emphasized that leadership in the casino-gaming industry must remain flexible in its approach to guide an organization through expansive times.

Because of the exponential growth of casino gambling in the past few decades, leadership in the casino-gaming industry has become a topic of interest (Hayles, 2010; Schaap, 2008; Schneider, Macey, Barbera, & Martin, 2009). Over the past 20 years, the casino-gaming industry has grown from a Nevada industry to one encompassing 29 states and 176 Native American Indian reservations (Wenz, 2006). Between 1991 and 1998, casino-gaming revenues grew 134% nationally (Thalheimer & Ali, 2003). During the period 1996 to 2000, some Las Vegas casino-gaming operations experienced growth three times the national average. For example, revenues at the MGM-Mirage Corporation (known today as MGM Resorts International) experienced revenue growth at a rate of 304% (MGM-Mirage, 2000). The continued growth of the Las Vegas casino-gaming industry creates a need to understand if the leadership style of managers plays a significant factor in that growth (Brownell, 2005; Van Wart, 2004). Understanding existing leadership styles at casinos provides management with a tool necessary for the development of future leaders as the business environment of an industry continues to change. Schaap (2006) determined through his empirical research of the Nevada gaming industry that the environment is in a state of constant change requiring flexibility in order to remain competitive. This study provides an exploration of whether managers in 21st century Las Vegas casino-gaming industry exhibit transformational leadership behavior. The significance of this information could develop a model to train future managers for the casino-gaming industry.

REVIEW OF LITERATURE

Significance to Leadership

The significance to leadership this study provides is a focus on employee perceptions of the leadership styles exhibited by managers in the Las Vegas casino-gaming industry. The foundation of this study focused on the theory of transformational leadership included in the Bass and Avolio (2002, 2004) full range leadership model (FRLM). The FRLM consists of three levels of leadership styles defined by eight specific components. The highest level of the FRLM is the transformational level. The transformational level includes four components: (a) charisma/idealized influence (II), (b) intellectual stimulation (IS), (c) individualized consideration (IC), and (d) inspirational motivation (IM). The middle level of the FRLM is the transactional level consisting of the following two components: (a) contingent reward (CR) and (b) management-by-exception (active) (MBEA). The lowest level of the FRLM is the passive-avoidant non-leadership level, which includes: (a) management-by-exception (passive) MBEP and (b) laissez-faire (Bass & Avolio, 2002).

The FRLM is a building process of the different levels of leadership based on specific leadership behaviors (Bass & Avolio, 2002). For example, the management-by-exception (active) (MBEA) component of transactional leadership centers on the observation of organization activities where the leader specifically looks for problems and errors and takes action only when something negative occurs

(Kirkbride, 2006). In contrast, transformational leaders take a more proactive role in organizational observation and direct action and interaction with their followers (Bass & Avolio).

The Multifactor Leadership Questionnaire 5X Short-Form (MLQ) is considered the primary tool for measuring the perception of followers about the leadership style of managers (Antonakis, 2001). This research study focused solely on the MLQ measurements of employee perceptions about the transformational leadership characteristics of managers in the Las Vegas casino-gaming industry. This study attempted to understand if a relationship existed between employee perceived transformational leadership style and revenue growth in Las Vegas casino-gaming operations that exceeded 100% for the period 2000 to 2006. The significance to leadership that this study raised relates to Schaap's (2006) study of Nevada casino executives. Schaap found that the Nevada casino-gaming industry presents a number of unique situations requiring different managerial approaches depending on the situation. Successful leaders combine each of these unique situations into a database of knowledge that enhances itself within the process creating solutions focused on the specific problem.

Transformational Leadership

Transformational leadership gained the attention of the leadership academic community and the social sciences because previous research on leadership failed to identify a single all encompassing style for every environment or situation (Barling, Christie, & Turner, 2008; Bass, 1990; Thompson, 2004). The shift in leadership paradigms began in the late 20th century focused on transforming ineffective leaders into effective leaders through the inspiration and motivation of followers (Spence-Lashinger & Finegan, 2005; Tucker & Russell, 2004). Al-Mailam (2004) found that transforming followers requires "enthusiasm, charisma and dedication" (p. 278) as critical components in successful leadership.

Bass and Avolio (2002) believed that charisma (idealized influence) is central to the transformational leadership process. The key to charismatic leading is the ability of leaders to influence their followers' acceptance of the organization's common vision (Jaskyte, 2004). Charismatic leaders articulate that vision by establishing their individual creditability (Ilies et al., 2006). Idealized influence is more than the admiration of one's followers based on popularity or personality. Idealized leaders create an atmosphere of follower desire to emulate the leader because the leader shares in the tasks required for goal attainment and the risks associated with those same goals (Bass & Avolio, 2002; Wu, Neubert, & Yi, 2007). This behavior establishes leadership credibility both internally and externally as all of the organization's stakeholders endow the leader with confidence and support (Bass & Avolio). Brown-Boone (2006) believed that idealized leaders become role models by establishing their expertise in guiding the organization. Leaders develop a level of confidence within the organization by creating a consistent environment where leaders and followers equally share risk (Brown-Boone).

Inspirational leaders expand their credibility by engaging their followers into accepting new responsibilities necessary for goal attainment (Bass & Avolio, 2002; Bass, 2003). These responsibilities begin with a clear articulation of the organization's vision and follows closely with detailed communication of this vision (Barbutto, 2005; Ozaralli, 2003). Intellectual stimulation uses influence (charisma) and inspiration to entice creativity and innovation among followers (Bass, 2003; Lim & Ployhart, 2004). Transformational leaders encourage followers to integrate creativity and risk-taking as a part of the problem solving process. Individual consideration focuses on the individual improvement of followers. Avolio and Yammarino (2002) equate the individual consideration component of transformational leadership to the contingency paradigm because leaders change styles based on the individual needs of their followers. Transformational leaders encourage creativity, individual responsibility and innovative approaches to support the leader's vision (Bass, 1985). Kouzes and Posner (2007) believed positive change is possible through articulated communication of a supportable vision within an environment relating the organization's vision to follower self-interests. Lester (2007) believed

the key to transformational leadership is the ability of top leadership to recognize that transforming an organization depends on change.

Hack and Roberts (2003) discovered that transforming an organization is a “means to change the nature, function, or condition of [an organization’s environment]” (p.1). Kirkbride (2006) posited that transactional leaders utilize customary punishment-reward methods to accomplish organizational goals while transformational leaders focus on a vision and process for guiding an organization and its members. Key dimensions of transformational leadership include (a) articulating a vision; (b) fostering group goal acceptance; (c) modeling behaviors in alignment with the articulated vision; (d) providing individualized support and consideration; (e) setting high expectations for performance; and (f) imparting intellectual stimulation. The leader’s behavior as a role model is imperative, setting an example for others to follow on the path to a common goal (Gooty et al., 2009).

Transformational leadership is not without controversy. Transformational leaders depend on their ability to influence followers by affecting their beliefs and values (Rowlett, 2005; Vera & Crossan, 2004). Unethical leaders use transformational leadership principles to take advantage of their followers (Homrig, 2005; Rowlett). Bass (2003) called this behavior *pseudotransformational leadership*. Pseudotransformational leadership behavior appears transformational on the surface, but in reality is selfish, ineffective, and immoral (Barling et al., 2008; Smith, Montagno & Kuzmenko, 2004). Examples of pseudotransformational leadership were the corporate scandals of Enron and WorldCom in the early 21st century (Bass, 2003). Homrig believed that transformational leaders could unscrupulously influence followers to abandon their individual desires in favor of the goals of their leaders. According to Action and Golden (2003) and Spence-Lashinger and Finegan (2005), pseudotransformational leaders create a distrustful environment that directly affects organizational performance including a diminished commitment on the part of their followers.

Khatri (2005) postulated that the Bass transformational leadership model includes conceptual and methodological flaws primarily the overlapping found within the four transformational leadership components. For example, Yukl (1999) believed intellectual stimulation is unclear and includes similarities with individual consideration and inspirational motivation. Khatri believed these similarities center on two primary constructs: charisma and vision. Charisma represents the conceptual construct of emotion and vision represents the methodological construct of intellect. Khatri found these constructs form the basis found within each of the Bass (1990) transformational leadership components. Following Khatri’s alternative model of transformational leadership, leaders fall within one of four leadership categories: (a) charismatic and visionary (transformational), (b) non-charismatic and visionary, (c) charismatic and non-visionary, and (d) non-charismatic and non-visionary. Central to the Khatri alternative model is the independence between charisma and vision. Khatri expanded his theory by demonstrating an overlap between transformational leadership and contingent reward transactional leadership. Key to the Khatri model is the presence of both constructs to inspire and lead an organization. Absence of either or both charisma and vision represents non-transformational leadership.

Bass and Avolio (2002) believed that the characteristics of a successful leader include components from each level of the FRLM. Successful leaders minimize their frequency as passive-avoidant leaders while maximizing their transformational leadership style. Many research studies have examined transformational leadership, empirically proving the value of transformational characteristics for effective leadership (Hetland, Sandal, & Johnsen, 2008; Pielstick, 1998; Young, 2004). Northouse (2010) extolled the intuitive appeal of transformational leadership: (a) leaders advocate for others, and (b) leadership is a process between leaders and followers. Transformational leadership also serves as an important mechanism for organizational change (Masood, Dani, Burns, & Backhouse, 2006). Schaap (2006) found there exists “a positive relationship between companies having success in achieving their financial and/or

strategic performance targets and a senior-level leader's style of leadership being inspirational to others" (p.21).

Tracey and Hinkin's (1994) research of hospitality industry executives found effective transformational leadership styles include a focused vision of organizational needs. Hartley-Leonard, former chair of Hyatt Hotels, believed that employee creativity is an integral part of a company's success (Tracey & Hinkin). Kouzes (1999) believed that leading people means caring about them. The development of individual followers defines leadership, not the leader's control over followers (Kouzes). In a study of 68 financial services managers, Feinberg, Ostroff and Burke (2005) found a positive correlation between transformational leadership behavior and followers' willingness to adopt the organization's vision. Tesone (2004) believed that hospitality leaders operate in a transformational environment by increasing the learning process of its leaders. Tesone referred to the learning process as the whole brain leadership model. The focus of the whole brain leadership model is learning through knowledge and experience. Successful hospitality leaders that are truly transformational utilize cognitive assimilation of information as the knowledge component. Working closely in conjunction with the knowledge component is the experience component. Tesone (2004) found that transformational hospitality leaders "create and enhance the leadership abilities of all staff members within a given organization" (p. 367).

Schapp (2006) conducted the only known empirical study of leadership behavior in the casino-gaming industry. Schapp studied 126 executives from throughout the Nevada gaming industry focusing on leadership styles in correlation to successful organizational performance. Schapp believed that successful performance encompasses two primary factors. First, leaders need to take an innovative approach to the structure of the organization. The second factor concerned the actual implementation of the organization's strategy. Schapp found that a correlation exists between the transformational leadership trait of inspirational motivation and successful performance. Although a specific leadership style does not explain organizational success in every instance, Schapp's study did determine that inspiring one's followers was a significant key to effective strategy implementation and eventual organizational success. The lack of additional empirical research indicates a need for additional study in the area of leadership in the casino-gaming industry.

METHODOLOGY AND RESULTS

There are many different methods for conducting effective and meaningful research. This study utilized a non-experimental quantitative method of cross-sectional research to examine employee perceptions about managerial leadership styles in the Las Vegas casino-gaming industry. Hair, Bush and Ortinau (2009) believed that survey research is an effective method for measuring a sample or the entire population to describe specific opinions or perceptions of a topic. Cross-sectional surveys measure existing perceptions at a fixed point-in-time (Hair et al.).

Hypothesis

The focus of this research study was on the MLQ measurements to understand if a relationship exists between perceived transformational leadership characteristics and revenue growth of Las Vegas casino-gaming operations for the period 2000 to 2006. This study compared employee perceptions of transformational leadership styles between Las Vegas casino-gaming operations experiencing growth in revenue exceeding 100% with those operations experiencing revenue growth less than 100% for that time period. The analysis of the data collected for the following hypothesis determined if a statistically significant difference existed in employee perceptions of managerial transformational leadership in Las Vegas casino-gaming operations:

H1: There is no difference in the perception of Las Vegas casino-gaming employees regarding their managers' possessing a transformational leadership style in operations having revenue

growth in excess of 100% when compared with operations having revenue growth less than 100% (for the period 2000 to 2006).

Instrumentation

This study utilized the Multifactor Leadership Questionnaire 5X Short-Form (MLQ) to measure the perceptions of casino-gaming employees about their managerial leadership styles (e.g. transformational leadership). The MLQ Form 5X consists of 45 rating statements utilizing a five –point Likert-type scale (0=not at all, 1= once in a while, 2= sometimes, 3= fairly often, 4=frequently, if not always) for measuring employee perceptions about the leadership styles of their managers. Antonakis (2001) verified the effectiveness and validity of the MLQ in his doctoral dissertation. Antonakis found the MLQ provides the most accurate measure of organizational leadership in a broad variety of business and academic environments. This study focused solely on the rating statements measuring the transformational style of leadership.

Population

Hair, Bush and Ortinau (2009) postulated that the target population of a research study encompasses individuals sharing a unique focus or purpose. Leedy and Ormrod (2005) found that the validity of the sample size depends on the level of homogeneity of the population. The more homogeneous the population, the smaller the sample required for a valid quantitative study. The population of this study was randomly selected from a homogenous population of Las Vegas casino-gaming employees. The target population was individuals currently employed in the Las Vegas casino-gaming industry. The sampling of a target population provided this research study with a representative group needed to generalize about the target population (Cooper & Schindler, 2005). The source of this target population originated from two sources: (a) individuals registered in the electronic mail database of the William F. Harrah College of Hotel Administration (Hotel College) located at the University of Nevada, Las Vegas (UNLV) and (b) UNLV alumni currently employed at Harrah's Entertainment.

A total of 71 individuals expressed an interest in participating in the current research study. A total of 18 individuals were eliminated from the results of the current study leaving a net total of 53 qualified participants. Unqualified participants were individuals not currently employed in the Las Vegas casino-gaming industry. Participants failing to complete one or more of the study documents were designated as incomplete responses. Other eliminated participants listed in their demographic survey a non-publicly traded or unidentifiable employer. The final sample of participants represented individuals that were employees of a publicly traded Las Vegas casino-gaming operation.

Demographics

The demographic distribution of this study included 56.6% female participants. The age distribution of participants included 77.4% between the ages of 18 and 35 years. The educational distribution of participants showed 58.5% currently holding a bachelor's degree. The employment demographics included 49.1% of participants in a line position of a Las Vegas casino-gaming operation. Study participants included 45.3% holding their current position for less than one year and 35.8% working in the casino-gaming industry between one and five years.

Findings

Bass and Avolio (2004) prescribed a set of guidelines as the benchmark for mean scores of employee perceptions about their leaders (see Table 1). For example, a mean score that is 3.0 or greater for any of

the four components of transformational leadership could denote that the employee perceived their managers' leadership style as transformational.

Table 1: Benchmark Guideline for Mean Scores of Full-Range Leadership Model Components

FRLM Component	Mean Range
Idealized Influence	>3.0
Inspirational Motivation	>3.0
Individualized Consideration	>3.0
Intellectual Stimulation	>3.0
Contingent Rewards	>2.0
Management-By-Exception (Active)	<1.5
Management-By-Exception (Passive)	<1.0
Laissez-faire	<1.0

This table shows the benchmark guidelines of the mean scores of the Full-Range Leadership Model.

The resulting descriptive statistics for the transformational leadership style of the FRLM indicate an overall mean score of 2.31 (sometimes). The mean score for the FRLM transformational leadership components of employee perceptions of their managers in Las Vegas casino-gaming operations that experienced revenue growth exceeding 100% was 2.34 (sometimes). In contrast, the mean score of employee perceived transformational leadership components of Las Vegas casino-gaming managers in operations failing to experience revenue growth of at least 100% was 1.91 (once in a while).

To test the hypothesis, The F test: two-samples for variances were generated to determine if the variances between the samples were equal or unequal regarding Las Vegas casino-gaming employee perception of the managerial leadership style of the four components of transformational leadership (idealized influence, inspirational motivation, individualized consideration and intellectual stimulation). Once the variances between the samples were determined to be equal or unequal, the appropriate t tests: two-samples for equal or unequal variances, were generated for each transformational leadership component. According to Cooper and Schindler (2005) and Creswell (2008), the t test: two-samples assuming equal variances or the t test: two-samples assuming unequal variances were appropriate because the t test measures the difference between the means of two groups with a small sample size (Cooper & Schindler, 2005; Creswell, 2008). The confidence interval for the current study was 95%.

Findings for Hypothesis 1

The F test: two-samples for variances of Las Vegas casino-gaming employee perception about their managers' idealized influence component of transformational leadership indicated the variances between samples were unequal, $F(3, 48) = 3.022$, $p = 0.039$ (one-tailed). As the variances were unequal between the samples, the t test (unequal variances between means) generated a t -statistic less than the t -critical value with three degrees of freedom. The result of the t test (unequal variances between means) indicates that employee perceptions are the same for both groups of employees and no significant difference exists in conjunction with revenue growth for the period 2000 to 2006 ($M = 2.39$, $SD = 1.04$), $t(3) = 0.605$, $p = 0.294$ (one-tailed), $p = 0.588$ (two-tailed).

The F test: two-samples for variances of Las Vegas casino-gaming employee perception about their managers' inspirational motivation component of transformational leadership indicated the variances between samples were equal, $F(3, 48) = 2.353$, $p = 0.084$ (one-tailed). As the variances were equal between the samples, the t test (equal variances between means) generated a t -statistic less than the t -critical with 51 degrees of freedom (pooled variances and observations). The result of the t (equal variances between means) indicates that the means of employee perceptions are equal and no significant difference exists between the means in conjunction with revenue growth for the period 2000 to 2006 ($M = 2.39$, $SD = 1.18$), $t(51) = 0.581$, $p = 0.282$ (one-tailed), $p = 0.564$ (two-tailed).

The F test: two-samples for variances of Las Vegas casino-gaming employee perception about their managers' individualized consideration component of transformational leadership indicated the variances between samples were equal, $F(3, 48) = 1.768$, $p = 0.166$ (one-tailed). As the variances were equal between the samples, the t test (equal variances between means) generated a t -statistic less than the t -critical with 51 degrees of freedom (pooled variances and observations). The result of the t (equal variances between means) indicates that the means of employee perceptions are equal and no significant difference exists between the means in conjunction with revenue growth for the period 2000 to 2006 ($M = 2.20$, $SD = 1.06$), $t(51) = 0.267$, $p = 0.395$ (one-tailed), $p = 0.791$ (two-tailed).

The F test: two-samples for variances of Las Vegas casino-gaming employee perception about their managers' intellectual stimulation component of transformational leadership indicated the variances between samples were equal, $F(3, 48) = 2.782$, $p = 0.051$ (one-tailed). As the variances were equal between the samples, the t test (equal variances between means) generated a t -statistic less than the t -critical with 51 degrees of freedom (pooled variances and observations). The result of the t (equal variances between means) indicates that the means of employee perceptions are equal and no significant difference exists between the means in conjunction with revenue growth for the period 2000 to 2006 ($M = 2.20$, $SD = 1.06$), $t(51) = 1.050$, $p = 0.149$ (one-tailed), $p = 0.299$ (two-tailed).

CONCLUSIONS AND IMPLICATIONS

According to Chung-Herrera, Enz, and Lankau (2003), competitive organizations in the 21st century depend on a comprehensive understanding of its leader's abilities and leadership style. Understanding the nuances and characteristics of the existing leadership styles provides management with a necessary tool for developing future leaders. This research study focused on the perceptions of employees working in the Las Vegas casino-gaming industry about the leadership styles found in their managers.

The results of the tests for the hypothesis failed to reject the null hypothesis for each of the four transformational leadership components. The mean scores of each of the transformational leadership components measured by the MLQ rating statements was (a) 2.39 (idealized influence), (b) 2.39 (inspirational motivation), (c) 2.20 (individualized consideration), and (d) 2.20 (intellectual stimulation) resulting in the employee perceptions that managerial leadership style does not include any of the transformational leadership components in conjunction with the percentage of revenue growth for the period 2000 to 2006. The results of the mean scores of each transformational leadership component measured by the MLQ rating statements fell below the range of the leadership benchmark guidelines of the FRLM presented in Table 1.

During the first half of the 20th century, scholars found that individual characteristics defined leadership (McCauley, 2004). The results of the various t tests generated in the current study indicated that no significant differences existed between the perceptions of the study's participants about overall leadership styles in Las Vegas casino-gaming managers in conjunction with the percentage of revenue growth for the period 2000 to 2006. This is a significant finding when contrasted with the studies of Lim and Ployhart (2003) and Spinelli (2006). In both studies, the MLQ results indicate a significant focus on the transformational leadership style. Lim and Ployhart found a strong relationship between the Five-Factor Model of Personality factor of extroversion and the components of the transformational leadership. Spinelli initially hypothesized that no difference would exist in the perception about hospital executive leadership traits. Spinelli found the perceptions of hospital employees correlated the four components of transformational leadership to the contingent reward component of transactional leadership. This study did not indicate the same association between transformational and transactional leadership styles in the overall leadership traits of Las Vegas casino-gaming managers. The mean scores of the four transformational leadership components indicated that employees did not perceive their managers as

transformational leaders. The conclusion of this study determined that Las Vegas casino-gaming employees perceived their managers as following the contingent rewards transactional leadership style.

RECOMMENDATIONS

The recommendations of the current study are based on the results and implications of the findings to management in the casino-gaming industry and for further research of this topic. The recommendation of this quantitative study for casino-gaming management is to incorporate the four components of transformational leadership into the training of future managers. This recommendation is the focus of the finding that Las Vegas casino-gaming employees perceive their managers as transactional leaders. According to Bass and Avolio (2004), transformational leaders encourage follower creativity and innovation resulting in a maximization of an organization's overall performance. Barling, Weber, and Kelloway (1996) believed that managers receiving training in the traits of transformational leadership develop an increased level of follower commitment to the goals of the organization. The inclusion of transformational leadership traits in the training of future casino-gaming managers could positively affect organizational performance by encouraging employee advancement.

The lack of previous empirical research of leadership in the casino-gaming industry provides numerous opportunities for future research. The current study focused on the perceptions of employees in the generalized Las Vegas casino-gaming industry about the leadership styles of their managers. Future research might solicit participants from a more diverse sample of casino-gaming employees from operations throughout the United States. Since 1976 and the legalization of casino-gaming in Atlantic City, New Jersey, the industry has expanded exponentially across the country including the implementation of the Indian Gaming Regulatory Act of 1988 (Wenz, 2006). An expanded sample of participants could provide more information about employee perceptions concerning the leadership styles of managers in the casino-gaming industry.

APPLYING JOHN RAWLS' DIFFERENCE PRINCIPLE: A CASE FOR A WEAK INTELLECTUAL PROPERTY REGIME IN GUATEMALA

Brian J. Quarles, University of Southern Nevada

ABSTRACT

While literature indicates that strong intellectual property (IP) protection is needed to attract foreign direct investment (FDI) in developing countries like Guatemala, the literature fails to address adequately the economic, social, and political risks facing developing nations in the reformation of their IP laws. This paper addresses those risks by applying John Rawls' Difference Principle. Rawls' Difference Principle depicts justice as an issue of fairness, which focuses on the distribution of resources and permits an unequal distribution only to the extent that the weakest members of society benefit from that inequality. This paper finds that Rawls would reject the findings from the literature and support a weak IP regime in Guatemala for three key reasons. First, economically, Guatemala's weakest members would have immediate access to otherwise price-prohibitive products and technologies. Second, socially, Guatemala could best reallocate resources to service Guatemala's weakest members more pressing needs. Third, politically, Guatemala's IP weak regime would be entirely consistent with the letter of the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) and improve relations with their trading partners. According to Rawls, Guatemala's approach to maintain a weak IP regime would be ethically sound.

INTRODUCTION

The role of intellectual property (as embodied in patents, copyrights, or trademarks) in the production of goods and services has resulted in intellectual property rights (IPR) becoming an important cornerstone of international economic policy. The optimal level of *strength* of these protections (e.g. weak or strong) has been vigorously debated. Developed nations argue that a strong IP regime is necessary to accomplish a wide variety of public goals (Smarzynska, 2002). These goals include: rewarding creators, promoting foreign investment, generating tax revenues, and supporting integration with the world trading system (Chatterjee, David, Deng, Dippon, & Lopez, 2008). In contrast, developing nations contend that the benefits of a strong IP regime are grossly exaggerated. For example, they argue that a strong IP regime alone will not attract FDI, but instead it is one of many factors necessary to promote rich economic growth (Prima Braga & Fink, 2000). Further, empirical evidence supports that maintaining an IP regime that is either too strong or too weak will harm any nation's economic well-being (Maskus, 1998). This paper discusses weak and strong IP regimes, not in absolute terms, but to describe whether Guatemala should maintain an IP regime similar in strength relative to those that exist in developed nations.

Literature supporting the use of strong IP protection in developing countries' economic strategies fails to address adequately the economic, social, and political risks facing developing nations in the reformation of their IP laws. This paper addresses those risks by applying John Rawls' Difference Principle. Rawls' Difference Principle depicts justice as an issue of fairness, which focuses on the distribution of resources and permits an unequal distribution only to the extent that the weakest members of society benefit from that inequality (Rawls, 1971). Part I of this paper provides background of the development and progression of Guatemala's intellectual property regime. Part II discusses the literature which advocates for strong IP regimes and examines the shortcomings associated with that literature. Finally, Part III addresses the economic, social, and political benefits of a weak IP regime in Guatemala and finds that Rawls would support a weak IP regime in Guatemala for three key reasons. First, economically, Guatemala's weakest members would have immediate access to otherwise price-prohibitive products and

technologies. Second, socially, Guatemala could best reallocate resources to service Guatemala's weakest members more pressing needs. Third, politically, Guatemala's weak regime would be entirely consistent with the letter of the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) and improve relations with their trading partners. According to Rawls, Guatemala's approach to maintain a weak IP regime would be ethically sound.

BACKGROUND

Historically, in Guatemala, there were no general requirements for local participation or any restrictions on repatriation of capital (U.S. Department of State Investment Climate Statement -Guatemala, 2008). Guatemala's major diplomatic interests were regional security and regional development (U.S. Department of State Investment Climate Statement -Guatemala, 2008). Though Guatemala participated in several regional groups, particularly those related to trade and environment, foreign investor interest in Guatemala was minimal. However, after 36 years of a bloody civil war, in 1996 the Peace Accords were signed and along with the deregulation of the electric and telecommunications sectors, the country began to experience an increase in foreign investment (Makransky, 2003).

In 1998, Guatemala sought to improve global competitiveness with the passage of The Foreign Investment Law (The Law) (Ley de Inversión Extranjera, Legislative Decree 9/98) of March 1998, which consolidated foreign-investment regulations and reduced the barriers to foreign investment (Makransky, 2003). The Law aimed to increase protection for foreign investment and remove many restrictions on types of foreign investment (U.S. Department of State Investment Climate Statement -Guatemala, 2008). The Law provided for eight free trade zones and offered incentives in the sectors of forestry, mining, tourism, and petroleum sectors. However, foreign investment was still restricted to minority ownership of domestic airlines and ground transport.

Guatemala further sought to increase economic growth when the Guatemalan Congress (Congress) passed the Industrial Property Law in August 2000, to bring the country's intellectual property rights laws into compliance with the World Trade Organization's (WTO) Agreement on TRIPS, which requires that members satisfy minimum standards for IP regulations. For example, pursuant to Article 61 of the TRIPS Agreement, trademark laws govern "any sign, or combination of signs, capable of distinguishing the goods or services of one undertaking from those of another undertaking" (TRIPS Article 61, 2009). Similarly, the Industrial Property Law sought to satisfy the same aims as TRIPS, namely to protect the unwary consumer from being misled as to the nature and origin of the good. The Industrial Property Law affords protection for the right to exclusive use of a trademark for a period of 10 years and may be renewed indefinitely for further 10 year periods (OTEXA Market Reports/Tariffs, 2010). In most cases, the Industrial Property Law aimed to provide the foreign investor with the same rights and enforcement mechanisms as a Guatemalan national (OTEXA Market Reports/Tariffs, 2010).

Further, consistent with its obligation pursuant to the TRIPS Agreement, the Industrial Property Law affords protection for a patent for 20 years from the date of filing the patent application (OTEXA Market Reports/Tariffs, 2010). Licensing agreements for patents have effect against third parties only if they are registered (OTEXA Market Reports/Tariffs, 2010). Finally, in the area of copyrights, the Law on Copyright and Neighboring Rights provides protection to the authors and right holders of artistic works (OTEXA Market Reports/Tariffs, 2010). Regardless of nationality, protection is given throughout the lifetime of the author and for 75 years after their death (OTEXA Market Reports/Tariffs, 2010). The owner of copyright and any persons specifically authorized by him have the right to prohibit the import or export of legally manufactured copies of their works and the import or export of copies manufactured without their consent (OTEXA Market Reports/Tariffs, 2010).

TRIPS contains enforcement system provisions that require a series of minimum measures the WTO Members must undertake to ensure the enforcement of IPRs (TRIPS, 2009). The Guatemalan Industrial Property Law includes and determines a series of general rules or provisions applicable to the enforcement procedures. Pursuant to the criminal penalty schedule, the Guatemalan Penal Code has a series of offenses related to intellectual property with prison terms between 1 and 4 years and fines between Q. 1,000.00 and Q. 500,000.00 (at an exchange rate of Q. 8.00 for 1 U.S. Dollar, these fines will be between U.S. \$125 and U.S. \$62,500) (Guide to Doing Business in Guatemala, 2005). This penalty schedule is consistent with Guatemala's obligation pursuant to the TRIPS Agreement. Article 61 of the TRIPS Agreement obliges contracting parties to "...provide for criminal procedures and penalties to be applied at least in cases of willful trademark counterfeiting or copyright piracy on a commercial scale" (TRIPS Article 61, 2009).

Despite the adoption of the TRIPS Agreement and the passage of the Industrial Property Law, Guatemala's enforcement of intellectual property laws has been inconsistent (U.S. Department of State Investment Climate Statement -Guatemala, 2008). A number of raids, cases, and prosecutions have been pursued against violators of IPRs; however, resource constraints and lack of coordinated government action impede efficient enforcement efforts (OTEXA Market Reports/Tariffs, 2010). Furthermore, Guatemala was listed on the United States Trade Representative (USTR) Watch List in the 2009 Special 301 report (USTR Special Report, 2009). The Special 301 Report is prepared annually by the USTR under Section 182 as amended of the Trade Act of 1974. The Act provides that the USTR must on an annual basis "identify those foreign countries that deny adequate and effective protection of intellectual property rights, or deny fair and equitable markets access to United States persons that rely upon intellectual property protection..." (The Trade Act of 1974).

Placement on the USTR Watch List creates a perception of surveillance by the USTR and may lead to U.S. bilateral trade sanctions. Key concerns cited in the 301 Report included: a) the need to provide higher priority to, and greater resources for, combating piracy and counterfeiting; and b) to enhance enforcement efforts by pursuing raids and prosecutions against small scale sellers and manufacturers of pirated and counterfeit goods (USTR Special Report, 2009).

The Industrial Property Law was modified in 2003 to provide pharmaceutical test data protection consistent with international practice and in 2005 the law was again amended to comply with IPR protection requirements in CAFTA (OTEXA Market Reports/Tariffs, 2010). In May 2006, Guatemala strengthened its legal framework for the protection of IPR with the passage of laws in preparation for the entry into force of the CAFTA-DR (OTEXA Market Reports/Tariffs, 2010). The CAFTA-DR provides for improved standards for the protection and enforcement of a broad range of IPR, which are consistent with U.S. and international standards of protection and enforcement as well as with emerging international standards. Finally, in April 2010, the Congress passed the Law of Partnerships for Economic Infrastructure Development (Ley de Alianzas para el Desarrollo de Infraestructura Económica, Legislative Decree 16/2010), which aims to increase foreign investment in infrastructure and public works by regulating the relationship between government and the private sector in public-private partnerships (PPPs) (Economist Intelligence Unit, 2010).

REVIEW OF THE LITERATURE

Literature indicates that strong and comprehensive intellectual property (IP) protection and enforcement are key ingredients to full-bodied economic growth and development. Commentators argue that foreign investments can induce much needed capital investments and technologies into the local economy (Smith, 2001). They argue that nations without strong IPR protections suffer both tangible and intangible losses. First, proponents for strong IP regimes argue that foreign investment is important for the economic development of many developing nations (Smarzynsk, 2002). For example, Lee and Mansfield (1996)

find the strength of a country's IPR protection, as perceived by 100 U.S. firms surveyed, is positively correlated with the volume of U.S. FDI inflows into that country. Smith (2001) also finds a positive correlation between sales of U.S. affiliates and the strength of IPR protection in a host country. Developed nations argue that foreign firms are reluctant to invest in countries that do not have strong protection of their intellectual assets (Smith, 2001). Consequently, such countries lose direct foreign investment (Lee and Mansfield, 1996). Second, developed nations maintain that countries with weak IP regimes deter foreign trade and cause export losses, which may result in both job losses and loss of foreign exchange (Smith, 2001). Finally, developed nations argue that the foundation for new business development in a country is the existence of a legal system to protect the rights of the entrepreneur and to promote fair competition (Vithlan, 1998). Consequently, a weak IP regime discourages inventiveness in that country since it deters honest producers from investing resources in new products and market development.

SHORTCOMINGS

By contrast, weak IP regime advocates argue that the optimal level of IP protection in developing nations is weak compared to that of developed nations. These advocates highlight the shortcomings of the literature. First, developing countries argue that there is little evidence supporting the view that strong IP protections would result in more FDI (Primo Braga and Fink, 2000). For example, Ferrantino (1993) finds no statistically significant relationship between the extent of U.S. affiliate sales in a foreign country and that country's membership in an international property convention. Similarly, Maskus and Eby-Konan (1994) as well as Primo Braga and Fink (2000) do not obtain statistically significant results.

Further, strong intellectual property protection may encourage firms to conduct more arm's-length technology licensing with Guatemala, which in turn will result in a reduction of FDI in Guatemala (Horstmann and Marusen 1987). As Primo Braga and Fink explained, intellectual property protection can affect foreign investment in two negative ways: First, strong IP protection provides title holders with increased market power and could cause firms to actually divest and reduce their service to foreign countries. Second, high levels of protection may cause firms to switch their preferred mode of delivery from foreign production to licensing. The strength or weakness of intellectual property protection is only one of the many location advantages that influence a firm's decision to internalize or externalize its intellectual assets (Maskus, 1998). As Maskus (1998) explained the relationship between intellectual property rights (IPRs) and FDI, IPRs are a critical component of the overall regulatory system, including taxation, investment regulations, production incentives, trade policies, and competition rules. Further, the collaboration of an overall pro-competitive business environment matters most for FDI (Markus, 1998).

Moreover, strong IP protections are thought to promote innovation; however, many developing nations like Guatemala lack the research capacity to maximize the potential advantages of a strong IP regime. Developing nations contend that it is disingenuous to assert that strong IPRs would lead to substantial increases in innovation (Kuan, 2003). Therefore, developing nations conclude that a strong IP regime alone does not attract FDI, but is a component of the bundle of inducements that developing nations often need to offer to in order to attract investment.

ECONOMIC COSTS

Advocates for weak IP regimes contend that strong IP protection comes with economic, social, and political risks for developing nations that developed nations do not face with the same gravity. First, developing nations face enormous economic costs to efficiently monitor and enforce their intellectual property regimes. The cost of salaries to maintain and enforce the infrastructure for the IP regime is overwhelming (Greenbaum, 2009). For example, the system requires qualified personnel to manage and enforce the system including training, examiners, administrative personnel, civil and criminal law

enforcement personnel, and judges. Though any nation faces costs associated with reformation and enforcement, developing nations face economic challenges of maintaining and enforcing an IP regime that disproportionately impacts their nations because many of its citizens live in extreme poverty.

Further, the issues facing IPRs' infringement in Guatemala are widespread, and Guatemala's enforcement of IPRs has been essentially ineffective because of resource constraints (OTEXA Market Reports/Tariffs, 2010). Guatemala City is one of the largest markets in Central America for name-brand goods, and the downtown streets are filled with local businesses selling imitation apparel from sneakers to jeans (Brosnan, 2000). A number of raids, cases, and prosecutions have been pursued against the sellers of this counterfeit merchandise; however, resource constraints impede efficient enforcement efforts (OTEXA Market Reports/Tariffs, 2010). A lack of effective enforcement of IPRs results in virtually meaningless reforms with Guatemala's IP regime. Consequently, it is difficult for developing nations to justify such economic costs necessary for IPRs' enforcement in the public eye when more than half of Guatemalans live in poverty (United States State Department Report, 2010).

Second, empirical evidence indicates that an increase in IPRs in developing nations may raise the prices for goods and services that citizens in the host country could not otherwise afford (Maskus and Eby-Konan, 1994). For example, in the case of HIV/AIDS drugs, these drugs are available in some developing countries but are too expensive for the majority of patients to afford (UNCTAD, 2005). Further, strong IP protections allow firms the power over the pricing and availability (and quality) of the items owned. Consequently, these protections would allow the exporting firms to enjoy greater market power and charge higher prices.

SOCIAL COSTS

Socially, the costs of maintaining a strong IP regime denies servicing the weakest members more pressing needs and causes them to feel further disenfranchised. Guatemala is one of the poorest countries in Central America (U.S. Department of State Investment Climate Statement -Guatemala, 2008). The majority of Guatemalans live in poverty on farms smaller than those required to feed the average family (U.S. Department of State Investment Climate Statement -Guatemala, 2008). Consequently, a strong IP regime often creates resentment among the citizenry because they complain the money to maintain a strong IP regime could be better used to service more pressing needs such as public health. Further, the citizenry feel further disenfranchised because they perceive a widening of the gap between the *haves and the have-nots*. Therefore, public perception that the Government has failed to prioritize properly the needs of its citizens often fuels protests and civil unrest in developing nations under a strong IP regime.

POLITICAL COSTS

Politically, elected leaders in developing countries are often faced with the challenges of two diametrically opposed positions: anti-IP protection public interest groups and pro-IP protection multinational firms. For example, when he introduced IP reforms in 2000, Guatemala's former President Alfonso Portillo received considerable backlash from the citizenry (Makransky, 2003). Guatemala's weakest members did not support those reforms to its intellectual property institutions. Many local business owners protested vehemently in the streets in opposition to the passage of the Industrial Property Law passed in 2000 (Brosnan, 2000). Many of these local vendors were significant contributors to Guatemala's economic growth and the political viability of these elected officials. In contrast, Guatemala faces international political pressure to spur local economic growth by becoming signatories to international trading agreements (Greenbaum, 2009). To address these pressures, developing nations overestimate the ability of their infrastructure to support the necessary enforcement of their IP regime. For example, Guatemala was listed on the Watch List in the 2009 Special 301 Report (USTR Report, 2009). Key concerns cited in the Report included the need to provide higher priority to combating piracy

and counterfeiting (USTR Report, 2009). Consequently, Guatemala's placement on the list threatens its political perception within the global community and foreign aid from the United States. Finally, leaders of developing nations may face political suicide by endorsing a strong IP regime or satisfying its obligations under an agreement when many local businesses and the electorate benefit from a weak IP regime

JOHN RAWLS' DIFFERENCE PRINCIPLE

One of the most widely discussed theories of distributive justice in recent years has been proposed by John Rawls. The system of intellectual property rights falls under what Rawls (1971) considers the *subject of justice* :

For us the primary subject of justice is the basic structure of society, or more exactly, the way in which the major social institutions distribute fundamental rights and duties and determine the division of advantages from social cooperation... Thus the legal protection of freedom of thought and liberty of conscience, competitive markets, private property in the means of production, and the monogamous family are examples of major social institutions (Rawls, 1971,6).

Rawls asserts that rational individuals in specially constructed, imaginary circumstances called the *original position* would select the principles that should govern the basic structure of a just or well-ordered society (Rawls, 1971). Persons in an original position will or should agree that all social primary goods (e.g., basic liberties such as opportunity, income, and wealth) are to be distributed equally unless an unequal distribution of any or all of these goods is to the advantage of the least favored (Younkins, 2000). In this position, behind what Rawls calls a *veil of ignorance*, Rawls thinks rational individuals would agree to two primary principles (the second of which has two parts). Rawls thinks that individuals would agree to: one, a system of equal liberty for all; and two, if there are to be differences, those differences will be in the interest of the least well-off, and attached to positions under conditions of fair equality of opportunity (Rawls, 1971).

According to the difference principle, the rational individual will choose a system of justice that adequately provides for those who are least well-off because the rational individual may end up in such a disadvantaged position. Rawls concludes that such a social contract will guarantee a just society without sacrificing the happiness or liberty of any one individual (Favor and Lamont, 2007). In other words, Rawls depicts justice as an issue of fairness, focusing on the distribution of resources, and permitting an unequal distribution only to the extent that the weakest members of society benefit from that inequality. As a result, Rawls' conception of justice puts the least well-off in the position that they would have been in except for some undeserved and unfortunate circumstances (Maiese, 2003). Therefore, Rawls would support a weak IP regime in Guatemala for four key reasons.

First, before explaining why Rawls would support a weak regime, Rawls would reject a strong IP regime because a grant of strong IP protections would not favor Guatemala's weakest members. Strong IP protection would not be accepted by rational individuals in the original position as just because, in trying to increase the well-being of the least well-off, the fact that Guatemala's least well-off would have no access to prohibited items (pharmaceuticals), via higher prices, harms them. Further, the lack of competition resulting from strong IP protections harms Guatemala. Strong IP protection allows the owner power over the pricing and availability (and quality) of the items owned. It would also allow firms to enjoy greater market power and charge higher prices (Maskus and Eby-Konan, 1994). That is, IPRs grant foreign firms monopoly power over their innovations. Monopolies do not help Guatemala's least well off; therefore, Rawls would reject a strong IP regime under these circumstances.

ECONOMIC BENEFITS

Economically, Rawls would favor a weak IP regime because Guatemala's weakest members would have immediate access to otherwise price-prohibitive products and technologies. Empirical evidence supports that an increase in IPRs in developing countries raises the prices for goods (e.g. pharmaceuticals) that citizens in the host country could not otherwise afford (Maskus and Eby-Konan, 1994). A strong IP regime provides protection for exporting firms against local copying of the product, suggesting that they would increase the market size facing exporters and induce them to sell more. A weak intellectual property regime would be accepted by rational individuals in the original position as just because, in trying to increase the well-being of the least well-off, the fact that the least well-off would have access to otherwise unavailable products benefits them.

SOCIAL BENEFITS

Socially, a weak IP regime best allows Guatemala to reallocate resources to service Guatemala's weakest members more pressing needs. Rawls would favor a weak IP regime because the costs of maintaining a strong IP regime denies servicing Guatemala's weakest members more pressing needs such as public health. Guatemala is one of the poorest countries in Central America (U.S. Department of State Investment Climate Statement -Guatemala, 2008). A common aim of Guatemala is to improve access to medicines for citizens (Makransky, 2003). Access to pharmaceutical drugs would represent increases in consumer welfare when compared to the prohibitive prices that would prevail with strong IPR protection (UNCTAD, 2005).

Further, public perception that the Government has failed to prioritize properly the needs of its citizens often fuels protests and civil unrest in developing nations. For example, business owners protested vehemently in the streets in opposition to the passage of the Industrial Property Law passed in 2000 (Brosnan, 2000). More than half of Guatemala's population lives on less than \$2 a day and 15 percent on less than \$1 a day (United States State Department Report, 2010). Guatemala's social development indicators, such as infant mortality, chronic child malnutrition, and illiteracy, are among the worst in the hemisphere (United States State Department Report, 2010). Rational individuals in the original position would not view a strong IP regime as just because it diverts needed funds from assisting with promoting more urgent needs such as public health. Therefore, Rawls would argue that a regime in which resources are distributed unequally to the advantage of Guatemala's least favored could relieve those tensions and stifle social unrest.

Moreover, Rawls would support a weak IP regime because Guatemala should receive redress for their undeserved inequalities when compared to developed countries. A weak IP regime should not be considered a safety net for Guatemala who cannot strongly compete against larger exporting firms, but instead a system, which does not reward undeserved entitlements. Rawls maintains that the job of distributive justice is to limit the influence of one's place of birth, social status, and family influences so that undeserved entitlements do not unduly influence the amount of benefits we receive in life (Rawls, 1971). The deep disparity between Guatemala and developed trading partners in the areas of wealth, education and familiarity with the frontiers of technological knowledge, in particular, means that these underserved inequalities call for redress in order to produce genuine (e.g., fair) equality of opportunity instead of procedural (e.g., formal) equality of opportunity. Rawls believes there is no more good reason to allow the distribution of wealth and income to be determined by the possession of natural endowments than by social and historical factors.

POLITICAL BENEFITS

Politically, Guatemala's IP weak regime would be entirely consistent with the letter of the TRIPS Agreement and improve relations with their trading partners. Many developing nations have weak negotiating power with developed trading partners. Under pressure internationally to spur economic growth, Guatemala became signatories to international IP treaties (Greenbaum, 2009). However, Guatemala's resource constraints make it ill-equipped to satisfy their obligations under the treaty because they overestimate the ability of its infrastructure to support the necessary IP regime. A weak regime promotes a more realistic evaluation of Guatemala's IP regime. Consequently, this would lead to higher level of compliance and ameliorate relations with trading partners. A weak intellectual property regime would be accepted by rational individuals in the original position as just because, in trying to increase the well-being of the least well-off, the fact that the least well-off would have access to improve trading position with their more developed trade partners.

Further, the preamble of the TRIPS Agreement recognizes "the special needs of the least-developed country Members in respect of maximum flexibility in the domestic implementation of laws and regulations in order to enable them to create a sound and viable technological base" (TRIPS, 2009). More specifically, Article 8 of the agreement states that "Members may, in formulating or amending their laws and regulations, adopt measures necessary to protect public health and nutrition, and to promote the public interest in sectors of vital importance to their socio-economic and technological development, provided that such measures are consistent with the provisions of this Agreement" (TRIPS, 2009). TRIPS permits all members, including those with great sectoral disparities, to "carefully tailor the country's protection to local needs" (TRIPS, 2009). Because the TRIPS Agreement covers only minimum standards of protection offered by each WTO member, it does not dictate the scope of protection beyond what the agreement requires. Indeed, Guatemala would not be the first developing country to successfully tailor its intellectual property system to the needs of local industries. For example, in China copying rates vary considerably across types of goods, with business applications software experiencing the highest rates and entertainment software and music recordings and motion pictures having lower copying rates (Yu, 2007). Thus, China decided to strengthen the protection for business software applications more than that for music recordings and motion pictures. Therefore, consistent with TRIPS, Guatemala may decide to protect more urgent needs such as public health and nutrition.

CONCLUSION

Application of John Rawls' Difference Principle warrants a conclusion that an approach of a weak IP regime in Guatemala is ethically sound. Guatemala's response to IPRs might be very different from the response of developed countries that do not face the same pressing economic, social, and political challenges Guatemala faces. Consequently, if Rawls is correct that behind a veil of ignorance, rational individuals would choose a system of equal liberty for all, but, if there are to be differences, they are to favor the least well off, then it is easy to conclude that Rawls favors Guatemala employing a weak IP regime.

THE SKILL SETS FOR MANAGING COMPLEX CONSTRUCTION PROJECTS

Glen Mouchi, Mouchi Project Management Ltd. Auckland
James Olabode Rotimi, Auckland University of Technology, Auckland
Thanuja Ramachandra, Auckland University of Technology, Auckland

ABSTRACT

Very few projects comprise the unique character that construction projects have. The product from construction processes are rarely similar with each having unique set of characteristics and qualities that set them apart from other projects. Hence the management of the production processes demand creative and often times imaginative managers for the achievement of successful outcomes. Undoubtedly complex projects will need to be resourced with the right calibre of managers because they are a higher order management activity. But what is the skill sets required of this calibre of managers? The paper reports on the perspective views of some senior management personnel in construction organizations on what constitutes complexity in construction and what skill sets will be required to achieve successful outcomes on those projects. Their views were obtained through semi-structured interviews. The responses are analysed descriptively with thematic summaries. The paper concludes that there are specific skill sets that are set apart for success on complex projects, and that the skills evolve from knowledge gained from exposure to a wide range of projects.

KEYWORDS: Project Manager, skill set, complex, construction project

INTRODUCTION

Construction is similar to other production-related industries, in that it follows the wheel of advancement and technology. The increasing demands of the construction industry to make the world a better living place for people has established it as a frontier of an ever advancing world. As a result construction projects are considered with wider perceptions, with project objectives requiring more extensive efforts. Globalization and healthy competition have played a key role in driving the industry to the limits. The industry is trying to pace up with progressively growing demands, varying needs and objectives. Therefore projects of sheer size, novel shapes constructed using innovative materials, methods and technologies have become normal. Projects undertaken in the Middle East during this early century are classic examples of the radical requirements for cutting edge performance by the industry. In probably similar developmental moves, the industries' clientele have become more business-minded and now set project objectives and deliverables that could be considered complex to achieve.

This complex, demanding, and dynamic requirements call for project managers that can manage the construction process from inception to successful completion (Leung, et al., 2009). Financial and reputation issues of construction organizations are now dependent on the project managers assigned to handle these projects. The consequences of a mismatch of skills and project complexity could lead to loss of control and monumental failure of these projects. Failures of projects like the Holyrood parliament building and the Sydney Opera house have raised concerns among industry and substantiated under-performance in the construction industry. Conversely success on projects such as the Burj Al Arab, Dubai Tower, Bahrain Twin Tower, Palm Island and World Island projects etc. highlight victory of skills, knowledge and competencies over prevailing industry issues and concerns.

Conventional and traditional approaches to managing projects may not suit complex projects. Several authors agree that complex projects are like systems and should be addressed systemically and many of

them found that the methodologies on controlling systems thinking alone are not suitable for today's projects (Remington and Crawford, 2004; Williams, 2002; Checkland, 1999; Baccarini, 1996). In order to have successful outcomes, project managers should adopt both a system and pluralistic approach with multi ways of thinking. Project managers must draw from a wide range of tools and skills and think in different ways; unconventionally create new methods to suit their projects and the problems they deal with. Managing a complex projects require different approaches and different mentality. Complex projects are a higher-order management activity and should be treated and resourced accordingly (Remington, and Pollack, 2007).

Therefore there has to be awareness on the skills required for different type of construction projects. This paper attempts to identify these skill sets particularly for complex construction projects. These skill sets are viewed from the perspectives of some survey participants, who begin by presenting their understanding of complexity in construction projects. In the next section a brief review of literature on construction project complexity and the functions and skills of construction project managers is undertaken. This is to give contextual background to discussions in the remaining part of this paper.

BRIEF LITERATURE REVIEW

Review Of Project Complexity

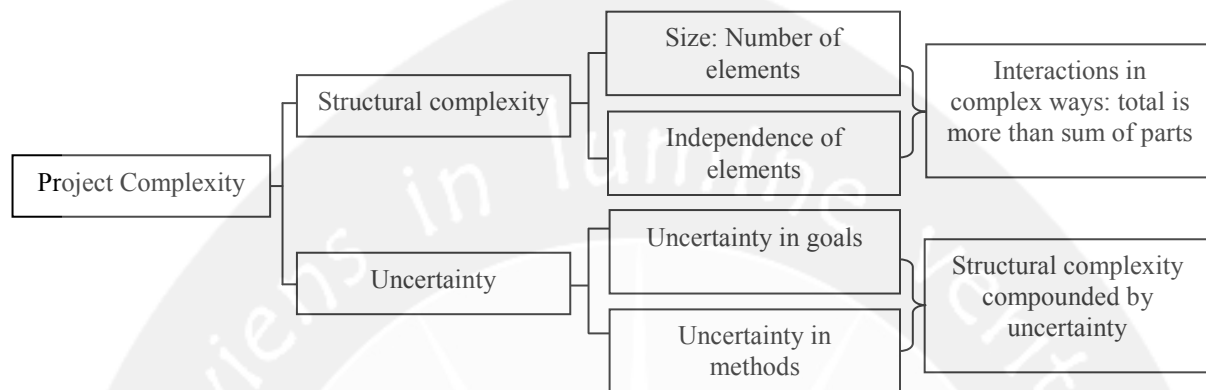

Project complexity is viewed differently by different scholars in the field. However the Centre for Project Management (CPM) in California gives a useful categorization that explains what constitutes complexity in construction projects. Four project types with varying complexities are identified by the centre to include: simple, organizationally complex, technically complex and critical mission projects.

Simple projects are projects which do not require much skills as most of these types of projects are repeated. They do not pose difficult challenges for project managers and most of the times have successful outcomes. The CPM concludes that these type of projects are better suited to new project managers, to start to build their excitement and interests for future projects. Organizationally complex types of projects are structured using a current and known technology, but the complexity is due to the new organizational environment, which could impact on an organization's functions and business decisions. Sometimes the projects could involve a combination of two or more new initiatives and processes. The challenge for the project manager on this project type is to decide the best way and which one to tackle first, whilst also contributing to the business in a proactive way.

Technically Complex projects are essential for organizations but are characterized more on their technical complexity than on their organizational value. Technical complexity could appear in different ways. In some cases the technology is new and unknown to the organization or at least there are a small team of professionals that could understand it. Involvement in these types of project is very risky and could lead to disasters. On the hand the projects may involve new technology known to the organization but for which there is no qualified person/ project manager to manage. As this type of project could involve multi changes and complications during its lifecycle, requiring new way of thinking and adopting new ideas alongside the project; the changes could be critical to success. The projects will require special skills and techniques in order to succeed in the mission. Finally critical mission type of projects, require a high quality of performance from project managers for both organizational and technical complexities as these projects are very significant to a business. In some cases organizations struggle to change the scope of the work to suit the changes happening every year, trying to cope with it and stay in line with new technology and be prepared for it. Obviously, this means a lot of work behind the scene and a lot of preparation for good and solid base ready to attack and thrust through the new and complicated projects.

Williams (2002) explains that overall project complexity is characterised by two dimensions: structural complexity and uncertainty. Each of these dimensions has two sub-dimensions as shown in Figure 1. Bertelsen (n.d) states that complexity in construction can no longer be ignored and that the basis for project management paradigms should thus be redefined. This is the real challenge!

Figure 6: Dimensions of Project Complexity (Williams, 2002)

Role, Knowledge And Skills Of Project Managers

Different types of projects need different types of project managers. Complex projects need project managers that are equipped with special skills to achieve successful outcomes. Complexity in the system does not require complex management but needs project managers with open minds and thinking outside the box. The projects need some initiatives from project managers to create and produce things that outside their job description. The most efficient project managers should be able to decompose the apparent complexity of the project situation in order to view it more simply. With great occurrence, projects are becoming cross-functional and progression-related and require personal skills and knowledge, interpersonal, and general management skills. This means that project managers should have knowledge and understanding about the business process. If the project manager is working in an environment that is supportive, it is a fortunate, if not it simply means being more self-reliant. Project success must be the main concern for any project manager and they have to be prepared for the battle.

The primary skill expected from a project manager is to have “good people skills”. It is very obvious and true that project managers deal with different types of people, trades and attitudes throughout the project lifecycle. The project manager takes the responsibility of the project and the process. They receive the blame or the praise at the end of the outcomes. They manage all the people but they do not have any authority over them, therefore, they have to have enough skills to influence the team and make them do what they plan to achieve. They have to persuade, negotiate and sometimes even have to beg to get things done. Thus interpersonal skills are required to be at the top of all skill requirements. Henry Ford says, “Coming together is a beginning. Keeping together is progress. Working together is success.”

According to Wysocki and Lewis (2001) project manager’s attributes vary from being a barrier to the rest of the organization to having visible leadership. Table 1 provides a listing of attributes expected from project managers. As shown in the table there are only few features which are related to technical and administration aspects of project management, while the rest are inclined towards people management. This shows that people skill is important in most situations because project managers are leaders and leaders have to effectively get people to follow their instructions and fulfil their goals. Two main types of leaders are in existence: those leaders that are more people oriented and those which lean towards task

orientation. How the project manager balances between the two without affecting the project outcomes is the real challenge for a project manager.

Table 1: Attributes of Project Managers

Attributes of project managers	
Buffer to rest of organization	Knows strength and weaknesses of team members
Challenges team to do well	Mutual ownership
Clears road blocks	Mutual respect
Delegates	Open minded
Fair	Organized
Follows up	Sense of humour
Gives feedback	Shares experience
Good decision maker	Supportive
Good listener	Team builder
Honest and trustworthy	Understanding
Knows own limitations	Visible leadership

Effectiveness Of Project Managers

In order to be effective in given tasks a project manager has to achieve project objectives and build a good relationship with his project team, meet client expectations and at the same time maintain the organization's profit motives. Méndez-Morse (1992) concludes that effective leader's behaviours have been categorized along two common dimensions: initiating structures (concern for organizational tasks) and consideration (concern for individuals and interpersonal relations". Having effective interpersonal relation (the ability to create good relationships between oneself and other people) that includes problem solving, decision making, and conflict resolution, are part of a project manager's responsibility. As a team leader the focus is limited to internal and within-team objectives but as a project manager the focus is more external, to see the whole picture and deal with all aspects/factors that could interfere with a project from the outset till completion.

Project Manager's Success

Project success is related to the deliverables, main drivers and objectives of any project. Success is measured by achieving what has been planned. Project success is defined as the satisfaction of stakeholder needs and measured by the success criteria identified and agreed at the start of any project (APM). Alternatively project success could be defined as a "collective assessment by project stakeholders (e.g. client/customer, sponsor, contractors) of the degree to which the project has achieved each of its objectives" (Project Manager Competency Development Framework). It is about blending all facets of success together to make a coherent whole (Abeysekera & Mclean, 2001).

$$\text{Success} = \sum (\text{Achievements of objectives})$$

Project success is dependent on factors such as planning, monitoring and controlling, team selection, technical performance, communication, leadership, strategic direction, team development, risk management (monitoring and controlling), organisational support, stakeholder management, organizational structure, and project definition (Crawford, 2000). Hartman and Ashrafi (2002) provide another useful dimension to project success by identifying ten factors that could contribute to project success. These factors are given in Table 2.

Table 2: Project Success Factors

Success Factors	Description
Project Mission	Clearly defined goals and direction
Top Management Support	Resource , authority and power for implementation
Schedule and Plans	Detailed specification of implementation
Client Consultation	Communication with and consultation of all stakeholders
Personnel	Recruitment, selection and training of competent personnel
Technical Tasks	Ability of the required technology and expertise
Client Acceptance	Selling of the final product to the end users
Monitoring and Feedback	Timely and comprehensive control
Communication	Provision of timely data to key players
Troubleshooting	Ability to handle unexpected problems

Project Managers' Leadership Skills

Project manager are expected to be leaders and be able to achieve balance between tasks and people, according to project situations and other factors and constraints. The term leadership is defined as the “art of getting others to do something that you believe should be done” (Packard cited in Lewis, 2002). Several key skills have been identified as attributes of good project management leadership. They include persuasion, people skills, self-confidence, project ownership and planning skills. These skills are briefly described in the following paragraphs.

Persuasive skills are an interactive process which inspires followers to achieve their leader's vision. It is the art of communication and meaningful language. Persuasion is a “generic name for a variety of communication skills and techniques that have as their purpose altering another person or group to the leader's point of view” (Fairholm, 2003 p. 185). Project Managers have to persuade people towards the achievement of successful outcomes. The Harvard Business School explains that credibility which is trust plus expertise, understanding of the audience, solid argument, and effective communication are the four elements that persuasion consists of.

Personality and people skills are more effective sometimes when an informal approach is adopted to get into the heart of people and share their feelings and make them feel part of one big family that are cared for. According to Collins and Lazier (1992) effective leaders master the paradox of both hard and soft management. They hold to incredibly high standards of performance (hard) yet they go to great lengths to build people, make them feel good about themselves and about what they are capable of achieving (soft). Six specific people skills outlined by Fisher (2010) are worthy of consideration here. They include:

1. Understanding behavioural characteristics: being genuine, open and honest with others develops an understanding relationship
2. Leading others: adopt good leadership style
3. Influencing others: Impressing others to support an agenda
4. Authentizotic behaviour: accept people for what they are and do not try to force them to change.
5. Conflict management: establish the root causes of the conflict
6. Cultural awareness: develop and apply an awareness of the cultural differences of team members.

The fourth people skill is self-confidence which is one of the fundamental and effectiveness requirements for project managers. Leaders without high self-confidence are unable to take the right decisions and to solve conflicts that could arise amongst their staff (Bass, 1999; Boyatzis, 1982); and Paglis and Green, 2002). Also leaders with high self-confidence are more likely to attempt complex tasks and to set challenging objectives and take more initiative to deal with problems.

The feelings of project managers towards their projects play a vital role in project success. It is like a relationship between two partners sharing all the good and bad times together. Similarly on construction projects a project manager should be proud and feel that the project is part of him/her. That feeling is not easy to be achieved and it will not be there if the project manager misunderstands the project and its objectives. Therefore understanding every element of the project, and building a gradual relationship with the project, a manager feels that he cannot go away from the project until achieving the goals.

Project managers should live the vision throughout the project life cycle. At the end it means that the project manager is taking care of every step and every activity on site; in other words the manager is taking ownership of the project. Project ownership is another fundamental skill which takes the project manager to the ultimate level of thinking and management. It is essential for new project managers when they start their career life working with senior project managers to think about this and start to build that feeling. After a while and after involving in few projects, it will become a part of their personality and another source of energy and motivation to drive projects and recharge the battery when it is needed. It is one of the skills that once it is gained, it stays. Complex projects require that project managers have a sense of ownership or feeling. Project managers need to be in a situation that they feel they are part of the project and they will see and forecast the problems before or at least they will be ready for it to find the proper ways to deal before they impact negatively on projects. Taking the ownership of project stays even after project completion. It is common for project managers to refer to their old projects, they lay claim on completed projects as if it is still theirs forever. They will talk about every moment they spent solving issues and other difficulties they faced; and proudly explain how successful the outcomes were. Where the outcomes were negative, they are quick to explain what lessons were learnt from it.

The last project manager's skill relates to the abilities to plan and schedule activity performance. Planning is a primary element which is required to ensure a project is following the right path towards set goals. It is not just to schedule time for tasks or activities, but it involves understanding the project elements and its structure, and how the building or the structure is going to be put together. Project managers need to be able to decompose projects so that they see the whole project specially the complex project into small subtitles or work breakdown structures. This will allow them to allocate the right resources to each activity and the duration required. Team members would be aware of what is required from them at each stage of the project lifecycle, mainly at the execution part of it. Clearly this shows how the project manager is keeping control of the process and he will be able to modify or overlap these activities as needed.

The foregoing has outlined the project management function and its skill requirements. The following section covers the data collection aspects of the study by first describing the study methodology, then presenting the study findings within the context of this papers objective.

RESEARCH METHOD

The objective of this study is to determine the skill sets needed by project managers for managing complex construction projects. The approach therefore used for the study was semi-structured interviews as the primary tool in identifying the project complexity factors and the skills required for project managers. Interviews were conducted with senior management level personnel of five construction organizations in New Zealand. For reasons of anonymity the interviewees are referred to as interviewees A to E (IA, IB, to IE).

There were 10 key questions asked which captured the perspective views of the Interviewees on their understanding of complexity in construction projects and of the skills required to manage this category of projects. The following gives the constituent questions in the semi-structured interview.

1. How would you describe complex projects from your organization's point view?
2. How many types of complex projects has your organization been involved in?
3. What sort of preparation would you put in place for this type of projects in your organization?
4. What skills would you expect your Project Managers to have, in order to manage these type of projects?
5. What sorts of training or tools are available to Project Managers in your organization to equip them for complex projects?
6. Can you give examples of these projects and what were the lessons learnt from their management of it?
7. Do you believe and expect that every Project Manager should be capable of managing a complex project?
8. What criteria were used for selecting the Project Managers engaged for your complex projects?
9. Do you believe that traditional management approaches are applicable in complex projects?
10. Could you identify (in three words) what you will consider as the most important skills that a Project Manager will need for successful outcomes on a complex project?

PRESENTATION OF RESULTS

Complexity in Construction Projects

From the range of questions asked from the Interviewees about their understanding of complexity in construction projects, it was possible to generate thematic summary of their responses. The responses are summarised in Table 3 below.

Table 3: Descriptors Of Construction Complexity.

Interviewees	Complexity Descriptors
IA	<ul style="list-style-type: none"> • Undefined and unclear project scope • Type of people being dealt with (project participants) • Technicality of the project (especially where not properly defined) that could create unique management challenges.
IB	<ul style="list-style-type: none"> • Complexity of clients' requirements/brief • Complex requirements and obligations that cannot be realistically implemented through to completion
IC	<ul style="list-style-type: none"> • Requirements for project staging and hand-over • Difficult construction sequencing • Staged handovers or staged access or milestones • Uncommon features and building elements • Unavailability of clearly defined documentation • Political issues around clients and project participants • Projects with large fluctuations in the management team requirements to deliver them. • Unusual structure, space and geometry (Construction is irregular)
ID	<ul style="list-style-type: none"> • Incomplete designs (too many unknowns before execution) • Technical requirement (requiring know how) • Cultural differences and perceptions • Project duration and project timing (sequencing) • Architecturally challenging • Project location and resource availability
IE	<ul style="list-style-type: none"> • Lack of construction details • Large number of stakeholders (and probably varied) • High levels of risks (technical, program, quality, client etc.)

The responses show that complexity of construction projects depend on a number of diverse issues which could develop throughout the project life cycle from conception to its commission and beyond. A recurring theme from the responses is the technicality of construction requirements stemming from complex clients briefs for projects with very unusual structure, space, and unusual geometry. Another

salient issue connected with project scope is the uncertainty resulting from incomplete designs as at the time physical execution has commenced on the project site. It is not unusual for design development to progress into the construction phases of projects but complexity comes from changes that may be brought about by scope changes that could affect completed sections of the works. One of the Interviewees explained that on a particular project they had the design running parallel with the construction. Staging was therefore complicated. Consultants were required to issue a package of full instructions and documents for the next stage of building, every two or three months during construction. The consultants were late with their information and the clients still wanted their building on time. The delay by the consultants made the physical progress squeezed up all the way through.

Similarly the content of the contractual agreements may allow for loosely defined scopes which are continuously or persistently modified to the detriment of the constructors. This is exacerbated further by difficulties that are associated with the processing of variations.

Complexity could also result from the dynamics of the construction supply chain (the project team). Proper project team integration expectedly should ensure smoother flow of operations but this is rarely the case and projects become difficult to manage. Team integration is more difficult with larger teams, each with varied interests and performance motives. One of the Interviewees alludes to the complexity of the managing relationship that existed between his construction company, the client and the project management company on one of their projects. In his words, *'they were never quite sure who was in charge'*. In another situation a public sector project became complex to manage because there were too many stakeholders and it became highly politicised.

From an organization's point of view, complex projects are projects that have large fluctuations in the management team requirements. The project might start with a few persons and then step up to requiring a larger team because there are a lot of activities taking place simultaneously and then it drops away again. These changes in work sequence impacts resource levels which in turn makes operations difficult to manage.

From these responses, it could be suggested that complex projects do not necessarily need to be large projects. For example replacing the roof from an inhabited building could become complex. Complex projects require additional efforts and thinking beyond the normal green field sites. On international projects it could be the cultural differences, knowledge of local people and work conditions that could make them complex.

From the responses, the factors contributing to project complexity were further regrouped into seven main factors and presented on a pie chart according to their thematic frequency. Figure 2 gives the percentage contribution of each of the seven factors. The figure shows that technical, buildability and architectural challenges is a chief reason (25%) for complexity in construction projects. This is followed by the size and staging of projects (20%). Factors such as poor documentation and insufficient details and drawings; uncertainty; and involvement of many clients and stakeholders are other significant factors that account for construction complexity.

The Project Manager's Skill Set

The second set of questions in the semi-structured interviews was focussed on determining the skill sets that were necessary for successful outcomes on complex projects. The interviewees had described what they understood complex projects to mean, they were then required in this section to explain what type of project managers they felt could handle these complex projects. Similarly, thematic analyses of the interviewees' responses were undertaken, and a summary of their responses is tabulated in Table 4.

Figure 2: Distribution of factors influencing complexity in construction projects

Table 4: Skills Required by Managers of Complex Projects

Interviewees	Project Manager's Skills for Complex Projects
IA	<ul style="list-style-type: none"> • Communication and people skills • Project management knowledge and experience • Be visionary and plan for its achievement • Good focus on the end results.
IB	<ul style="list-style-type: none"> • Clear vision. • Good leadership skills • Good communicator with all stakeholders and operational staff • Good technical knowhow on how to put all the project puzzles together • Good focus
IC	<ul style="list-style-type: none"> • Good leadership skills, • Good communicator • Knowledgeable and with the required capacity to understand the complexities of the project. • Excellent negotiation skills • Excellent people management and motivation skills. • Able to delegate and relate to people • Highly developed technical skills and able to understand project deliverables • Good understanding and ability to see how the completed project should look. • Able to forecast project buildability and the process needed to achieve this • Need to have clarity and people skills
ID	<ul style="list-style-type: none"> • Able to manage performance • Empathetic team leader, who provides practical support to his team • Ability to maintain flexibility • Leadership and good people skills • Strong desire for getting things done and motivate the team • Ability to plan projects logically • People management skills (as the captain of the team)
IE	<ul style="list-style-type: none"> • Good communication skills • Forward-thinker and be able to look well ahead for risks/problems in advance • Strategic visioner • Ability to make others accountable for their performance

The skill sets identified by the interviewees in the Table 4 have been condensed into four key skill sets which a capable project manager should have for successful outcomes on complex projects. These four skill sets are presented in the pie chart below as Figure 3.

Figure 3: Skills Required of Project Managers

The figure shows that communication, people skills and leadership abilities; good visions and focus on the end results; planning and risk management skills; and finally technical skills and experience are all important skills for a project manager. Each of the skills is adjudged 25%. By implication, no one skill is dominant in its requirement for successful outcomes because they all have equal status. The planning skill covers a whole range of planning requirements such as planning for project risks, time management, planning for quality achievement, health and safety planning etc. According to one of the Interviewees, 'it is not just about programme of works, but it is about putting a plan in place for all the different things involved in the project execution'. These skill requirements are explained further in the discussion section to put them in perspective.

DISCUSSION

From the result of the study findings, one can reach a conclusion that construction project managers need to be focused, be good leaders and communicators and that they need the capacity to understand the complexities of the project under their control. Explicitly also is the need for the project managers to be forward-thinkers so that they are able to leave through a project in advance, anticipating all operational bottlenecks before they occur.

A complex project requires strong and committed leadership that will get the operational team to perform to project expectations. Although the bigger the project the lesser is the project manager's involvement with the nuts and bolts of what is going on. Nonetheless the project manager will be expected to delegate and motivate the right calibre of support personnel that will deal with the nuts and bolts of the project. One of the interviewee puts the leadership and people skill set more succinctly, when he asserts that every person who comes through the project manager's door needs to be managed and possibly treated accordingly. This could be the client, the project consultants, subcontractors, and sometimes the project manager's own personnel. All these needs must be met using different approaches from subtle to more rigid and non-compromising stance. This particular skill sets derives from experience which often times cannot be taught in schools. Another interviewee explains that the objective of their organisation is to gradually introduce the young project manager to different job demands. This exposes the project manager to different types of skill sets requirements that will mature over time.

The moment a project commences, a capable project manager should already be thinking about its completion, so that all planning efforts will be directed towards planning for its completion. Hence the

need for strategic visions of the future and the ability to anticipate all work requirements. Especially those requirements that could impact on the achievement of project objectives.

CONCLUSION

In conclusion this study has shown that complexity in construction projects is dependent on seven key factors viz:

- uncertainty in project scope and requirements
- poor documentation and insufficiency of design details
- technical and buildability issues
- size and staging of project activities
- the size and nature of relationships between the project participants
- cultural issues related to location and resource availability, and
- organizational requirements for project execution.

Whatever the level of complexity of construction projects, success is achievable so long as the right project manager with the right skills is engaged to tackle it. Although this may appear simple, unfortunately it is not the case always. The good news is that more and more organizations have embarked upon and succeeded on complex projects. There is an understanding of the requirement for special skills for competent project managers and a willingness to provide support when needed. This will result in a win-win for the project manager and these organisations.

The roles of project managers are like a two-edged sword, which could result in either success or failure. The right vision for success comes from lateral thinking skills. Regardless of the level of complexity of construction projects, skills requirements will include those of: technical skill and experiential knowledge, communication and people skills, leadership, planning and risk management, and finally is the vision and focus on end results.

SOCIAL REPRESENTATION OF WORKERS AND COMPANY GROUP IN AN EMPLOYEE HANDBOOK

Gorete Marques, School of Technology and Management,

ABSTRACT

A company is a social construction with common interests that shares social practices such as beliefs, values or procedures. These practices, which always contain a cultural dimension, are constructed discursively, so companies must be aware of their importance in their representation, not only for the external public but also internally. Based on this contextual framework, this paper aims to analyze how a Portuguese company group builds the representation of two social actors: management (group) and workers in the first text of its employee handbook "Welcome". This analysis tries to answer the following questions: How are these participants of social practices represented? What kind of relation is established between them? The analytical work is based on the principles of Systemic Functional Linguistics, through the exploration of the system of Transitivity (Halliday, 2004), and on Theo van Leeuwen's sociosemantic inventory of social actors (1996, 2008). These results are part of a general study on the analysis of representations of the company group in internal and external documents.

KEYWORDS: Representation; Systemic Functional Linguistics; Social Semiotics.

INTRODUCTION

Corporate culture has been studied in many different approaches but the growing interest in the role of language promoted a new vision of companies. Alvesson and Kärreman (2000, p. 137) refer that it is a "linguistic turn" in post-modernity. Companies are in fact discursive constructions and as such convey meanings. Within this framework, our aim is to analyze how a Portuguese company group builds its representations in the first text of its employee handbook. To accomplish this objective, we will present, in the first part, the nature and functions of the employee handbook, the principles of Systemic Functional Linguistics (Halliday 1994, 2004) and Theo van Leeuwen's sociosemantic inventory of social actors (1996, 2008). We will first describe the theoretical framework, the analytical instruments used in the *corpus* analysis and methodology used. Afterwards, we will present our analysis and results in order to answer these following questions: (i) How are management and workers represented? (ii) What kind of relation is established between these social actors?

FRAMEWORK

Culture refers to a set of practices associated with the production and exchange of meanings among members of a group or society (Hall, 2003 [1997], p. 2). Williams states that "the history of the idea of culture is the record of our meanings and our definitions, but these, in turn, are only to be understood within the context of our actions." (Williams, 1990 [1958], p. 295). Through the production and reproduction of meaning, everything is tied together in society. Consequently, culture leaves its "passive" role as a component determined by society: it is a dynamic element fundamental in social reproduction, where language is both a mediator of the production of meaning and a signification system, containing, reflecting and restoring the relations of meaning and power, present in everyday cultural practices (Ferin, 2002, p. 138). Based on the premise that the considerations about the interplay between culture and society, the practice of production and reproduction of meanings, have the same validity as if transposed into the organizational universe, the delimitation of the study of organizational culture has gained new contours. Therefore, companies are a construction of meanings by people with common interests around social practices (beliefs, values, procedures, among other aspects). These practices, which always contain a cultural dimension, are constructed discursively. Fairclough (2001) presents the bi-dimension-language

society, asserting that they interact in a relationship internal and dialectic. Language is a process and a social practice, being also determined by society. The use of language as social practice is, according to Fairclough, discourse. Then, discourse and society are linked and establish an interdependent relation based on which identities and social relations of social actors are built.

Discourse as social practice in the business world has the role of conveying systems of values, attitudes, symbolic relations and institutional image companies, both internally and externally. Hence, identities, ways of thinking and acting are, in short, the corporate culture.

Thus, the employee handbook is part of culture, part of the designing programs for welcoming the new workers and is as an active form of socialization. Moreover, it is considered a fundamental instrument of organizational practice, both the newcomer either to the organization that aims to guide him and provide its values. The aim is, therefore, to facilitate the integration of the newcomer, assimilation of collaborative information to his good performance and the construction of relationships in workplace. Generally, the employee handbook generally follows the parameters set by the organization on a converged infrastructure that includes information about the life and operation of the organization, its structure, functioning dynamics of the subsystems of human resources management, social benefits, support and other information. Pereira (2008) focuses on the structure of this textual genre and presents a typical structure that includes a brief summary of contents of each of its sections, including: welcome, the organization's history, general information about the organization; procedures for prevention and protection; description of responsibilities, code of conduct and career prospects and training.

THEORETICAL FRAMEWORK

In this analysis, we follow the socio-semiotic conception of language by Halliday (2004), according to which language is a mode of meaning in a cultural and social context. In fact, language constitutes itself as a system of meaning production in an interdependent relationship with the context, through three metafunctions: ideational interpersonal and textual. The focus is on the first, ideational metafunction, considering its role in the construction of representations. In fact, different choices may reflect different representations of the same event. Thus, Halliday proposes the experiential system of transitivity as a tool that analyzes different semantic categories interrelated, that is experiential meanings expressed in sentences (processes, participants in the process and circumstances associated to the process). The main processes are divided in experience representation of the inner world, of consciousness, feeling and knowledge (mental processes), in experience of the outside world (material processes) and in experience of the being world, with processes that relate fragments of experience, classify and identify (relational processes). Within the boundaries of these processes, there are other processes that share some of their characteristics: behavioural, verbal and existential processes. Each process type provides its own model or schema for construing a particular domain of experience as a figure of a particular kind (Halliday, 2006, p. 170), to which participants and circumstances are associated.

This approach is a starting point for the development of other studies that integrate the relationship between discourse and social practices considering that society is composed of relations that, through language, define different participants roles. Van Leeuwen (1996, 2008) argues that discourse is a way of representing social practices and proposes socio-semantic categories for the analysis of social actors. According to this author, actors may be included (inclusion) or excluded (exclusion) in a total (suppression) or partial (backgrounding) way. When included, actors can be activated or passivated (by subjection or beneficialization). Both Activation as Passivation can be accomplished by participation, and circumstantialization possessivation. Other roles are assigned to actors such as personalization or impersonalization. The former enables a generic reference (indetermination) or a specific one (determination), as individuals (individualization) or as groups (assimilation) quantified (aggregation) or not (collectivization). The latter represents actors by abstract nouns or by concrete nouns without

"human" feature. Van Leeuwen points out that this study is grounded in systemic functional linguistics but his objective is to develop a system network – a sociosemantic inventory.

CORPUS AND METHODOLOGY

The employee handbook is from a Portuguese company group - Electrofer - specialized in the projections, construction and assembly of metallic structures and surface treatment. It was provided by the Director of Human Resources group and is available for consultation at the internal computer network. This document contains forty-three pages divided between images and texts relating to (i) welcome (ii) description of the group, (iii) general questions about the Group and (iv) legal aspects. The analyzed *corpus* for this article consists of the first text of the employee handbook "Welcome" (200 words) and is part of a larger study about the representations of this company group in different semiotic modes.

The qualitative analysis of the corpus, through the transitivity system and the sociosemantic inventory, is complemented with the quantification of data in order to understand the most used participants, processes and representation structures.

ANALYSIS

In this text, "Welcome" ['Boas Vindas'], the Group is not limited to the role of Sayer who welcomes the employees. In fact, their distinct roles are assumed since the beginning. From a general perspective, we observe that the group is activated by participation in the role of Sayer, Actor or Senser. It is an active participant, although, in most grammatical constructions, is achieved in the first person plural present in the verb ending (in the Portuguese language the personal pronoun may be omitted when conjugating verbs). Examples: (1) "It is with pleasure and a positive expectation that we welcome you as a worker of one company of GROUP ELECTROFER." ['É com prazer e uma expectativa positiva que lhe damos as boas vindas como colaborador/a de uma das empresas do GRUPO ELECTROFER.']; (2) "We want our employees to feel as an active and important part of the GROUP ELECTROFER and to be proud of belonging to it." ['Desejamos que os nossos colaboradores se sintam parte activa e importante do GRUPO ELECTROFER e tenham orgulho em lhe pertencer.']. Although the ellipsis of the pronoun, the group is realized: it is a human participant, personalized with an active and distinct identity from workers, even when represented in the third person plural. Example: (3) "The companies of the group ELECTROFER emerged and grew thanks to commitment and dedication of all workers." ['As empresas do GRUPO ELECTROFER surgiram e cresceram graças ao empenho e dedicação de todos os seus colaboradores.']. It is important to notice that "companies" is a concrete noun without human semantic feature represented, in van Leeuwen's sociosemantic inventory, as Impersonalization, specifically in the sub-category of Objectivation. According to his description, no trace of "humanity" is included.

However, we consider that the essence of humanization is not solved in this example in a binary system, in the absence / existence of that feature. Assis (2009) is sensitive to this issue when proposing the inclusion of the sub-category Institutionalization in the system of Objectivation. In the framework of this proposal, the Institutionalization is seen as a reference to the social actor through the institution to which it belongs. It is a way of personalize / humanize Institutions by assigning human characteristics, whereas they do not act alone in the world (Assis, 2009, p. 118). Incidentally, this reasoning contributes to the intertwining of the ending of the first person plural to the group, as noted in this example: (4) "Since the quality, efficiency and satisfaction of stringent commitments we made a bet of this GROUP, trust and commitment of all our workers are essential." ['Sendo a qualidade, a eficiência e a rigorosa satisfação dos compromissos que assumimos uma aposta deste GRUPO, é fundamental a confiança e a dedicação de todos os nossos colaboradores.']. The group is partially excluded (backgrounding), in a second plan, when it is represented as employer that offers offsets to the workers: (5) "The respect that our workers deserve from us is reflected in our concern in providing good working conditions both in terms of facilities,

equipment and safety, both from a human and relational view.” [‘O respeito que os nossos colaboradores nos merecem reflectem-se na preocupação em lhes proporcionar boas condições de trabalho quer a nível de instalações, equipamentos e segurança, quer do ponto vista relacional e humano.’]

We note, indeed, the use of nominalization "preoccupation" [‘preocupação’] which choice demonstrates the removal of this social actor but the exclusion to which it refers does not omit or delete the group entirely. Van Leeuwen (2008, p. 29) explains that when actors are pushed to the background, they may not be mentioned in relation to a given action, but they are mentioned elsewhere in the text, and we can infer with reasonable (though never total) certainty who they are. In this case, the exclusion leaves a trace: the previous inclusion of the social actor as well as the possessive and the personal pronoun “us” [‘nos’].

The group also strengthens its representation, in a more indirectly way, by the repeated possessive "our" [‘nossos’] / "your" [‘seus’], activating “workers” [‘colaboradores’]. The question of the use of the possessives, as noted in (2), (3), (4) and (5), naturally reflects a relationship between a possessor and a possessed, generating an asymmetrical power relationship. The possessivation toward the group expresses itself primarily through the use of the preposition "of" [‘de’] mainly associated with "companies" [‘empresas’] as evidenced by the example (3). In these cases, although the inclusion of the actor in the representation, he is not highlighted as in cases of participation. Possessivation postmodifies “companies” [‘empresas’], representing them as part of a whole, or part of the group specified by its name or by the contraction of the preposition with the demonstrative, as in example (4). In both cases, the group is individualized, so a clear distinction between this group and other business groups is established.

In summary, the group is mainly activated by participation and possessivation. Still, it is also represented by Circumstantialization, through circumstances of Cause and Purpose and a circumstance of Spatial Location “in this organization” [‘nesta organização’] that, once again, differentiates the group. It is also a Beneficiary, in a passivated condition, as Beneficiary: (6) “Each and every one, are important to the success of the Group and to the full satisfaction of our customers” [‘Todos e cada um, são importantes para o sucesso do Grupo e para a satisfação plena dos nossos clientes.’]. In this sense, it is a receptor of an activity and postmodifier of "success" [‘sucesso’]. Thus, the Group/companies are activated by possessivation, benefiting of the identification of the workers.

The construction of the representation of the recipients of this handbook, workers, includes those who are already part of the universe in question, whom the group owes its growth, and newcomers that the group wants to integrate. Workers are represented in terms of its activity, they are categorized by their functionalization. This social actor is initially represented in the singular, integrating both genders, and passivated as Receiver, through the personal pronoun "you" as the example (1) illustrates. The role of workers is also emphasized in that example in the Circumstance of Elaboration Mode, through Circumstantialization, where possessivation is established in a possessive relationship between worker/group. This is a relationship that is repeated in the text, established by the use of the preposition "of" [de]. According to van Leeuwen (2008, p. 33), by comparison to participation, possessivation backgrounds agency, changing it into the “possession” of a process which has itself been transformed into a “thing”. Observe, in this regard, (4), in particular the postmodifier that activates “trust” [‘confiança’] and “dedication” [‘dedicação’].

Workers’ agency is in background, as it is transformed into the possession of the processes to trust / to dedicate transformed into things: trust / dedication. This feature is repeated for instance in (3) where, once again, the social actor does not assume a leading role and is integrated in circumstances of Mode Means and Cause Purpose. The whole "commitment and dedication" [‘empenho e dedicação’], "trust and dedication" [‘confiança e dedicação’] are associated to workers through possessivation, but this actor also appears activated by participation (6). The contribution expected from workers is always associated with a specification that aggregates, as in (3) and (4) ("all employees" [todos os colaboradores]) but both

individualize (“each one” [cada um]) in the same nominal group (6) or in isolation (“each collaborate” [cada um colabore]) (7).

This means that the character generalizing covers all workers, regardless of their position or function, either by individualization, either by assimilation, by sub-category of aggregation. All that already belong to the group demonstrate their commitment, dedication, trust, so that all are important. To this extent, they play the role of Identifier, associated to the intensive identifying relational process “are”, activated by participation, as shown in (6).

When the group is a Senser, in two mental propositions workers appear as Phenomenon and, as such, passivated. Their inclusion in subjection, exemplified in (2), reveals its unequal position in relation to the group. These propositions project other prayers where employees are enabled by a relational process, material and mental. Through these processes, embedded in the role of Phenomenon, the group explains what it intend from workers: (7) “We hope, therefore, that each collaborate and make the most of yourself, it takes a personal involvement and develop a positive attitude and creative critical to the success of companies.” [‘Esperamos, por isso, que cada um colabore e dê o melhor de si mesmo, que assuma um envolvimento pessoal e desenvolva uma atitude positiva e criativa fundamental para o sucesso das empresas.’]

Thus, the obligation of the workers comes as a direct and personal specification. The use of singularity is a way to represent a close relationship between them and the group (management) and to charge them for the future of companies. Moreover, as noted in (6), workers are represented by the personal pronoun “them” [‘lhes’], passivated and (Client), so therefore beneficialized (subcategory of Passivation).

finally, in “welcome to the group electrofer” [‘bem vindo ao grupo electrofer’] the reference to the worker in the singular, as in the beginning of the text, is a partial exclusion. This is, again, to represent the integration of the new element in this particular group. Workers are categorized by functionalization and passivation through roles such as Phenomenon, Beneficiary or through possessivation. They are also represented by aggregation (“all”) associated with individualization (one each) in a single sentence to describe them, which reinforces the specification and the emphasis on the role of workers in the construction of the group.

CONCLUSION

From this analysis, we conclude that both employees and employer (group) are mainly represented through inclusion, despite the cases of partial exclusion. Nevertheless, these social actors are actually represented in different ways and play distinct roles. On the one hand, the group (management) is mainly activated and, as such, is an active and dynamic force; on the other hand, workers are mostly passivated, they are actors who are undergoing or receptor of an activity (van Leeuwen, 1997, p.187). In the representation of workers, there is a distinction: those who are already part of the group, to whom the group owes its success, and the newcomers, to whom it communicates its expectations for their performance.

SKILLS NEEDED IN THE 21st CENTURY WORKPLACE: A COMPARISON OF THE RESULTS OF FEEDBACK FROM UNDERGRADUATE BUSINESS ALUMNI AND EMPLOYERS WITH A NATIONAL STUDY

Diane M. Holtzman, Richard Stockton College of New Jersey
Ellen M Kraft, Richard Stockton College of New Jersey

ABSTRACT

The purpose of this research was to determine what skills alumni from Richard Stockton College of New Jersey (RSC) and regional employers think are important for the workplace. The results of the RSC study were compared to results from the report, College Learning for the New Global Century, sponsored by the Association of American Colleges and Universities. Managing time, speaking/oral communications skills, and having strong interpersonal skills were in the top five skills identified by both employers and alumni of The Richard Stockton College of New Jersey. A statistically significant greater percentage of employers who participated in the study commissioned by the Association of American Colleges and Universities identified knowledge of global issues as being an essential learning outcome compared with the employers and alumni surveyed in the RSC study who rated knowledge of global issues as being a very important or important skill for the workplace. The lower priority given to global issues and international perspectives by employers and alumni in this study may have been due to the location of their workplaces.

LITERATURE REVIEW

Colleges and universities have many stakeholders: students, faculty, students' parents, employers, public officials, community leaders, and the general public. These stakeholders share a common need to know whether institutions of higher learning are preparing students adequately for future jobs (Association of American Colleges and Universities, 2008). The reports by task forces, commissions, and accrediting bodies expressed concern about the quality of undergraduate student learning related to skills that are needed in the workplace. In their undergraduate education, students should develop the necessary skills, abilities, attitudes, and values that are essential to success in the complex business world. Faculty in higher education must address the diverse demands placed on graduates rather than concentrate on narrowly focused, job-specific technical skills. If higher education is to provide graduates with the knowledge and skills they need in the workplace of the 21st century, curricula must change to reflect the dynamic needs of business (Association of American Colleges and Universities, 2008; RAND, 2004; Zekeri, 2004). Stiehl and Lewchuk (2002) stated that one of the first steps in curricula design should be for faculty to learn what their students need to be able to do in the workplace. With input from external stakeholders, faculty can make informed decisions about what particular skills and competencies are most important for their students and for the employers of their graduates. Once the necessary skills are identified, faculty should design curricula that incorporate those skills and competencies. With feedback from external stakeholders, faculty can develop curricula that are structured around management, marketing, and finance courses in which the teaching of academic skills is embedded (Ferguson, 2004).

METHOD

A survey packet was mailed during April 2008 to 2,383 alumni and 145 employers of The Richard Stockton College of New Jersey that explained the study, provided information on informed consent for participation in the study and presented the questions for the study.

Alumni were asked to place a check mark in the column that best represents their views regarding the importance of 24 different skills or competencies in performance of their job. Employers were asked to rate the importance of the same 24 skills and competencies in their organization. Both employers and alumni rated the skills as very important, important, limited importance, or not important. Of the 24 survey questions, 12 of the questions related to the data presented the *College Learning for the New Global Century* (Association of American Colleges and Universities, 2008).

RESULTS

Table 1 lists the 24 skills and the percentage and number of alumni who reported that the skill was very important or important for the workplace. The researchers hypothesized that there would be differences between what skills the alumni and employers thought were very important or important for the workplace. Statistical hypothesis testing was used to evaluate the significance of the percent differences between the two samples. The null hypothesis for a factor, such as managing time, for example, is that alumni and employers have the same percentage of respondents who think the skill is very important. The p-value was calculated by using the method for statistical inference for the difference of two sample proportions with different sample sizes. The null hypothesis is rejected if the p-value is less than 0.05. Rejecting the null hypothesis implies that a significant difference exists between the percentage of alumni and employers that rated the skill as very important. The p-value is reported in the third column of Table 1. Whether or not the percent difference is significant is reported in the last column of Table 1. The top five skills that alumni rated as very important or important were thinking critically/analytically (98%), locating, organizing, and evaluating relevant information (97%), interpersonal skills (96%), time management (96%), and speaking/oral communications (96%). The top five skills that employers rated as very important or important were interpersonal skills (100%), time management (100%), speaking/oral communications (98%), ethical understanding (98%), and adapting to change/being flexible (96%).

Managing time, speaking/oral communications skills, and having strong interpersonal skills were in the top five skills rated by both employers and alumni. Alumni rated thinking critically/analytically and locating, organizing, evaluating relevant information as two of the top five skills as being very important or important whereas employers did not rate these skills in their top five choices. Ethical understanding and adapting to change and being flexible were in the employer's top five skills, but not the alumni's. There was a statistically significant greater percentage of alumni (98% versus 86%) than employers who rated critical thinking as being a very important or important skill. There was a statistically significant greater percentage of employers than alumni that rated ethical understanding (98% versus 86%), interpersonal skills (100% versus 96%), and time management (100% versus 96%) as being a very important or important skill. Despite the statistically significant difference in the percentage of employers and alumni identifying interpersonal skills and time management, both of these skills were in the top five skills that alumni rated as important or very important.

Both the alumni and employers rated basic knowledge of global issues/international issues as the least important skill. The Richard Stockton College of New Jersey is a State University in which the majority of the students attending the college are from New Jersey. The majority of employers surveyed are regional businesses that do not have a global presence. Hence, the survey respondents did not rate knowledge of global/international issues as important or essential since these issues do not influence regional businesses in the same way they affect multinational corporations with a global presence.

Understanding the influence of political and social issues on business decisions was in the top five skills selected as being of limited importance or not important by both employers and alumni. Employers rated knowing the basics of financial theory and analysis, basic knowledge of accounting principles, and quantitative reasoning as three of the five least important skills. A statistically significantly greater

percentage (43% versus 26%) of employers rated knowing the basics of financial theories and analysis as being of limited importance or not important for the workplace. Basic knowledge of economic principles, basic knowledge of marketing principles, and understanding market trends in the industry were in the other three skills in alumni's top five choices for skills of limited importance or not important for the workplace. There were no significant differences between the alumni and employees identifying basic knowledge of accounting principles, quantitative reasoning, basic knowledge of economic principles, and understanding market trends in the industry.

Table 1: Skills Rated as Very Important or Important for the Workplace by Employers and Alumni

Skill	Percent Alumni (Number Alumni)	Percent Employer (Number Employer)	p-value	Is Percent Difference Significant?
Managing Time	96% (153)	100% (45)	0.007	Yes
Interpersonal Skills	96% (154)	100% (45)	0.013	Yes
Speaking/Oral Communication	96% (155)	98% (44)	0.571	No
Ethical Understanding	81% (128)	98% (44)	0.000	Yes
Adapting to Change and Being Flexible	94% (152)	96% (43)	0.748	No
Locating, Organizing, Evaluating Relevant Information	97% (156)	95% (42)	0.674	No
Written Communication Skills	94% (150)	93% (42)	0.808	No
Leadership/ Motivation Skills	87% (139)	91% (41)	0.398	No
Thinking Creatively to Solve Problems	92% (148)	91% (41)	0.864	No
Working Independently	94% (151)	91% (40)	0.461	No
Teamwork Skills	92% (147)	89% (40)	0.563	No
Thinking Critically/Analytically:	98% (156)	86% (38)	0.036	Yes
Computer Skills/Information Technology	93% (150)	84% (38)	0.130	No
Respecting and Valuing Diversity Issues	77% (123)	84% (38)	0.233	No
Understanding Market Trends in the Industry	71% (108)	79% (33)	0.305	No
Understanding Law/ Regulations on Business Decisions	72% (114)	77% (33)	0.533	No
Basic Knowledge of Management Principles	75% (119)	71% (32)	0.579	No
Basic Knowledge of Marketing Principles	59% (91)	71% (30)	0.136	No
Basic Knowledge of Economic Principles	57% (88)	69% (27)	0.138	No
Quantitative Reasoning: Ability to use mathematics or statistics	72% (113)	61% (27)	0.194	No
Basic Knowledge of Accounting Principles	71% (111)	60% (24)	0.192	No
Knowing Basics of Financial Theories and Analysis	74% (116)	57% (25)	0.033	Yes
Understanding the Influence of Political, Social Issues on Business Decisions	57% (89)	53% (23)	0.678	No
Basic Knowledge of Global Issues/International Perspectives	38% (58)	43% (17)	0.620	No
